It is generally believed that Servetus was the first to describe the pulmonary circulation. M. Chéreau, in the *Revue des Deux Mondes*, brings great learning and research to prove that Servetus must no longer be credited with this discovery. It was Realdo Colombo, "the Claude Bernard of the sixteenth century, the type of the true *savant*, the enemy of hollow theory, the lover of truth, and seeking it in vivisection"—it was Colombo who first recognized the physiology of the lesser circulation, according to M. Chéreau.

It is true that Harvey himself attributes the discovery of the lesser circulation to Columbus, and the latter claims it distinctly for himself; but it is also true that the work of Servetus was published before that of Columbus, and is, in one respect, more accurate—to wit, that he denies any direct communication between the ventricles of the heart.

How to Gargle the Naso-pharynx.

When the gargle is designed to reach the naso-pharynx, Dr. Löwenburg recommends the following method:—

The patient inclines the head horizontally backward, and performs movements which we may call "quasi-deglutition," not including the last portion of this physiological action, definite swallowing. The liquid is passed much higher behind the soft palate than the ordinary method of gargling will permit; some persons succeed so well in this manœuvre that they are able to reject by the nose the liquid which has been received by the mouth. Moreover, these rapid muscular contractions completely detach the abnormal secretions, which can then be easily expelled, and the greatest possible relief is thus given to the patient.

Tayuya as an Anti-Syphilitic.

We have at various times referred to the tincture of tayuya as an alleged anti-syphilitic. It is prepared from a Brazilian plant, and has been tried especially in Italy. Dr. Ciro Betelli has lately submitted it to a careful chemical examination, and has isolated two active principles, both poisonous, of the class of narcotic paralysants. Prof. Tantarri gave the tincture a full trial in the hospital of St. Ursula, Bologna, and pronounces the opinion that it does not in any way modify the development of syphilis. Dr. Pedrelli reports two cases with similar negative results.

On the testimony of these witnesses, whom we quote from the *Journal des Sci. Med.*, of Louvain, we think tayuya may be dismissed as valueless, at least so far as its action in syphilis is concerned.

Sanitation in Yellow Fever.

Many of the Southern physicians doubt whether the most careful precautions materially influence the spread of yellow fever. Dr. J. H. Herrick, one of the editors of the New Orleans *Medical Journal*, for instance, says, in a recent note—

As to local sanitary conditions, observation amply proves that yellow fever is not mitigated by good nor aggravated by bad sanitation. The three conditions needed for a prevalence of the disease are subjects susceptible to its specific cause, the presence of this cause, and a temperature high enough to render it active. Eliminate one, and the other two fail.

Responsibility of the Insane.

In cases of partial insanity the responsibility of the sufferer is constantly a vexed question. Among late studies of the subject is one by Dr. T. L. Wright, of Bellefontaine, Ohio, which appears in the Cincinnati *Lancet and Clinic*. He reaches the conclusion that the partially insane are always responsible; that they are never responsible in an equal degree with the sane; that they cannot justly be held responsible in the same manner or kind in which persons of sound mind are held; and finally, that as a corrollary from the above conclusion, it is claimed that it is the duty of the State to provide a place of confinement for the criminally insane, different from jails and penitentiaries, and different also from the ordinary insane asylum.

The Alkaloids of Squills as Diuretics.

The hypodermic injection of the various alkaloids of squills has been tested by Dr. Fronmüller, and the results given in the *Memorabilien*, No. 6, 1879. It is well known that squills contain an acrid narcotic poison. In Merck's famous laboratory three alkaloids have been extracted, *Scillitoxin*, *Scillin* and *Scillipicrin*. The first mentioned contains largely the poisonous principle, the second occurs in very small quantity, while the third is not at all poisonous, is tolerably abundant, and easily soluble in water. Dr. Fronmüller found it to take the first rank as a diuretic. In fifteen cases of oliguria it doubled the discharge, or more, in all but one, and in that considerably increased it. The local irritation was easily met by ice applications.

Arsenic in Cardiac Disease.

The effect of arsenic on the heart is not alluded to in the works of Hayden or Fothergill (at least not in their indexes); nor does the "National Dispensatory" speak of it in this connection.

Dr. Darwin, the father of the present eminent philosopher, was probably the first to notice the specific action of arsenic over the nervous system and heart. He administered a saturated solution of arsenious acid in a case of heart disease with surprising effect. Full doses of the more soluble preparations of arsenic produce retardation of the heart's action, an effect said to be due to paralysis of the motor ganglia, or rather to a limiting action of the remedy, which renders the muscular tissue of the heart less irritable.

Correspondence.

FOREIGN.

The International Medical Congress.

Amsterdam, Holland, Sept. 12th, 1879.

Ed. Med. and Surg. Reporter:—

I cannot permit to pass unnoticed such an interesting occasion as the meeting of the "International Congress of Medical Science," holding its sixth annual session, this year, in the interesting city of Amsterdam. Accordingly I send you a few lines concerning the position of Prof. L. A. Sayre and his associates, who during the sittings of this Congress are looked upon as representative Americans.

The distinguished and learned Prof. Donders, of Utrecht, a most noble man, with a warm and generous heart, and who does honor to the specialty of ophthalmology, has been elected President. In this choice the Congress displayed its good taste, for the honor was certainly merited. Soon after taking his chair the President announced the various Vice-Presidents, who, as a rule, were men renowned in their respective countries. Among them was Dr. Sayre, whose appointment was received by the Congress with unanimous applause. As he stepped upon the platform to acknowledge the compliment, his elegant physique and grand head made me feel proud of my country's representative. And I would mention in passing, that no other man, with the exception of our noble "Gross," has done so much toward paving the way for the proper reception of American medical men in Europe. Dr. Sayre's wonderful fund of knowledge, and his facility of manipulation of the joints of the human body, coupled with his natural eloquence and noble unselfishness, makes every lover of his profession estimate him most highly. These attractive features in his character, and his enviable position of President elect of the American Medical Association, have been appreciated, not only by his colleagues throughout Holland, but also by the citizens of Amsterdam.

Not to be outdone by the attentions he has received, he yesterday gave a dinner, which was in every respect worthy of the occasion. Some fifty gentlemen sat down in one of those rarely furnished rooms in the "Maison Zomerdijk Bussink," which by its size and appointments is so well adapted for both comfort and entertainment. After full justice had been done the viands before us, and the bill of fare was all the greatest connoisseur could have desired, our host announced the toasts, prefaced by the following remarks:—

"Standing here, in the presence of the representative of my country in Holland, Mr. Axerme, our American Consul, and under my native flag, I thank you all here present, from the bottom of my heart, for the great honor that you have done me in coming to this place, and for the pleasure that I now feel in having your company."

Then followed a manly and most excellent speech from the American Consul, also speeches from the Amsterdam Council. Most admirable and appropriate were the remarks of each medi-

cal representative, especially those of Prof. Lister and Ernest Hart, Esq.

The remainder of the evening was devoted to a musical and dramatic entertainment, under the auspices of our confrères of this city, and so ended one of the most admirable reunions of the medical men of Amsterdam.

Enclosed please find a detailed programme of the proceedings of this Congress.

LAURENCE TURNBULL, M.D.

Puerperal Convulsions.

ED. MED. AND SURG. REPORTER:—

It has been the misfortune of the writer to meet recently, 15th inst, his second case of this kind the current year, and as the result in a typical case follows a certain line of treatment, it may be well to advert to it now, as was done in the case of February, reported in this journal. The frequent failure of our best directed and most assiduous efforts in this fearful trouble should at least lead us to reflect on that which holds out the best chance, as time is life here, while delay or indecision is death.

Sunday, September 15th, 6 A.M. Mrs. M., primipara, age 20, 8 months gone. Sanguine and of full habit, slight general anasarca. First convulsion came at 3.30 A.M., in her sleep, waking her husband by its violence. Her fifth convulsion had just passed off. Inserted at once, hypodermically, ¼ grain morphia and ten drops fluid ext. veratrum viride. While trying to cord the arm another violent convulsion came on, immediately after which she was bled from a free orifice, rapidly, to three pints, under which perfect quiet of respiration and soft steadiness of circulation were brought about. In 45 minutes another convulsion came; bandage was taken off and she was bled two pints more, till she became perfectly quiet. From this there was no return of convulsion. A malarial complication being suspected, 20 grains of calomel mixed with butter was put in her mouth. At 9 P.M., in a semi-conscious state, she asked to relieve the bladder, and passed one pint of urine, smoky-black in color. From midnight she was able to take quinine freely; slight pains came on Tuesday, but quieted down. Quinine again from Tuesday midnight. At 6 A.M. Wednesday she was fully conscious. Labor then set in regularly. At 9 P.M. gave birth to a living child, and at this writing has progressed to a happy convalescence, intent on eating, both child and mother living and thriving.

EDWARD H. SHOLL, M.D.

Gainesville, Ala., Sept. 22d, 1879.

Morphia in Asthma.

ED. MED. AND SURG. REPORTER:—

In Vol. XLI, No. 13, Dr. S. Leslie West mentions the hypodermic use of morph. sulph. as a successful method of alleviating the sufferings of patients afflicted with asthma, and by way of apology states that he has not seen this treatment mentioned in medical literature.

Niemeyer, in his "Text Book of Practical Medicine," refers to it, and Hartshorne, in "Essentials of Practical Medicine," states that, according to the practice of Hirtz, "Hypodermic injections of morphia have sometimes given immediate relief."

I would also add that I have frequently given morphia hypodermically in asthma, in hospital practice, while interne in the City Hospital, of St. Louis (1876), and always with beneficial results.

In private practice I have not resorted to hypodermic injections, for the reason that I have not had a case that would not yield to the use of potassium iod. in an infusion of senega (or combined with the syrup) and the inhalation of the fumes of stramonium and nitre.

There is this objection against the use of morphia hypodermically, that patients are very liable to become habitual consumers of this drug, and thus "jump from the frying pan into the fire."

A. H. MEISENBACH, M.D.

Muscoutah, Ill.

The Decimal System Again.

ED. MED. AND SURG. REPORTER:—

The prompt adoption of the metric system by the medical profession is surely a strong and telling refutation of the idea that the profession clings to old and antediluvian notions and systems, simply because they are old and have become generally used. But it is always best to make haste slowly. It certainly is not a perfect system of weights and measures to adopt, if it is necessary, as Dr. Prince suggested in his last article, published some time ago in the *American Practitioner*, "to furnish his apothecary a table of approximate equivalents." It is generally understood, I think, that a prescription should be so written as that any competent druggist may fill it. In late numbers of the REPORTER Drs. Merrick and Connor propose to inaugurate the new system on this plan. They will have one grain represented by .06, but sixty grains will not be 3.6 but 4. This discrepancy it is proposed to drop. Now, I am in favor of the new system, but I don't think it is just the thing to have an "understanding with your druggist." Better learn the system as it is and should be learned, and then let the druggist do likewise, and he will have no trouble. The new system, if of any value, must be alike everywhere.

Le Claire, Iowa. J. A. DE ARMOND, M.D.

NEWS AND MISCELLANY.

Personal.

—Dr. Julius Klob, Professor of Pathological Anatomy at the University of Vienna, died recently, of typhus, at the age of 49 years.

—The death of M. E. Chassaignac, the celebrated surgeon of the Lariboisiere Hospital, Paris, and the inventor of the *écraseur* and drainage tube, took place August 26th. He was born in 1805. His clinics were very popular, but several years ago he retired from the active duties of the profession. We remember him well "twenty golden years ago."

College Items.

—The Jefferson and University, of this city, have opened with full classes. Dr. Roberts Bartholow delivered the introductory address in the former.

—The Cincinnati Colleges have lately made a commendable advance, by raising their fees, and we are glad to report that instead of a falling off in the number of students, there is an actual increase over past years at this time in the season, and by another year it is said they will all be in condition to take steps in placing themselves on the same plane with Harvard, the University of Pennsylvania, Chicago Medical College and Bellevue Hospital Medical College, which last mentioned has announced that after the session of 1879–80 it will adopt a graded three years course with final examinations in the elementary branches at the end of the first and second sessions; the examinations for graduation at the end of the third session being confined to the branches of Practice of Medicine, Surgery and Obstetrics.

Alarming Prognosis of Protoplasm.

At the last meeting of the British Association for the advancement of science, Professor Huxley actually indulged in some fun at the expense of the primordial "basis of life," or protoplasm, which some years ago he and Hæckel had christened *Bathybius*. The Professor said his young friend Bathybius was a youth of great promise, but had not turned out so well as his friends expected. A gentleman present made the following summary of Dr. Allman's address, as President of the Association:—

> From life to consciousness the chasm
> Cannot be bridged by protoplasm.
> All flesh is grass, but chlorophyll
> Can all man's duties not fulfill.

Moral:—Be not in haste to pin your faith to the dreams of "great thinkers."

Ohio Anatomy Act.

At last Ohio has an anatomy act. It was passed last June, and goes into effect January 1st next. It enacts that the unclaimed bodies of those dying in public institutions shall, "on the written application of the professor of anatomy in any medical college, or the president of any county medical society, deliver to such professor or president, for the purpose of medical or surgical study, or dissection, the body of any person who has died in either of the said institutions, from any disease not infectious, if such body has not been requested for interment by any person at his expense." No State has more urgently needed such a law.

The Yellow Fever.

The *Bulletin* of the National Board of Health observes—

The most striking feature in the comparison of the fever of 1878 with that of 1879 is the wide diffusion of the pestilence in the former as compared with the latter year. Not only did it spread rapidly through the cities which it attacked last year, but it extended quickly to neighboring villages, which it remorselessly decimated. At this period last year it was reported that the "fever prevails in a number of small towns in Louisiana, Mississippi and Kentucky." Its progress is very different this year. In Memphis its course is slow, while in New Orleans it has been completely arrested. Thus far it has attacked but few small towns, and in those it has been summarily stamped out.

Items.

—In the recipe for koumiss, page 280, an obvious misprint occurs: "carbolic" for "carbonic acid."

—Attention is directed to the advertisement of the gentleman who advertises for a partnership in this number.

—An instance of heredity in crime is furnished by Elias Phillips, of Freetown, Mass., who recently appeared as a witness in a burglary trial, having turned State's evidence. He is a great grandson of Malbone Briggs, a notorious criminal, who was in State prison with seven of his sons at one time. Briggs' ancestry is traced back to a noted pirate in the time of Earl Bellamont, and his branch of the family has for over a century furnished noted criminals in every generation.

QUERIES AND REPLIES.

Morphia in Asthma.

MR. EDITOR:—If Dr. West, of Wilmington, Del., see REPORTER of Sept. 27th, page 284, will add $\frac{1}{60}$ grain sulph. atropia to his dose of morphia, in his asthma cases, he will, I am satisfied, find he will need less morphia, and his puncture will give larger respite, and act better in every way. I have treated spasmodic asthma by hypodermic use of morphia for four years, and for the last two years always combined with sulph. atropia.

Ironton, Tenn. S. W. CALDWELL, M.D.

Dr. J. B. H., of N. Y.—You can order French and German medical periodicals through E. Steiger, 25 Park Place, New York city. He has a catalogue of them which he will send you on application.

Dr. H. P., of Ga.—English authorities no longer attribute gout to fruity wines or alcoholic beverages, but to excessive nutrition.

Alva.—Browne's *Jurisprudence of Insanity* will probably meet your wants.

Student—Anybody has a right to call themselves Veterinary Surgeon in England, and to practice as such: the claim amounts to nothing.

MARRIAGES.

ARNOLD—SPIER.—In New York, at Trinity Chapel, on Tuesday, September 23d, by the Rev. Dr. Swope, assisted by the Rev. Dr. Houghton, Glover C. Arnold, M.D., and Emily, daughter of Judge Gilbert M. Spier.

BOND—BARNES.—On the 25th ult., by the Rev. William H. Neilson, Frank H. Bond, of this city, and Miss Mary Barnes, daughter of the late Dr. John R. Barnes, formerly of Camden, N. J.

HORSFORD'S
Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges.

MANUFACTURED BY THE

RUMFORD CHEMICAL WORKS,

1155-1206 PROVIDENCE, R. I.

DE DUDLEY'S EMULSION DE
OF PURE
NORWEGIAN COD LIVER OIL
PANCREATINE
AND
DE LACTO-PHOSPHATE OF LIME DE

FORMULA.—Each fl. oz. contains six grs. of Pancreatine, sixteen grs. of Lacto-Phosphate of Lime, twenty-five per cent. of Glycerine, and **fifty** per cent. of Norwegian Cod-liver Oil.

THE ONLY PANCREATIC EMULSION MADE IN THE UNITED STATES.

This preparation is respectfully submitted to physicians as being **always** reliable. Although well aware that Cod-liver Oil Emulsions have fallen into deserved disrepute, yet we are confident this will stand any test or trial it may be subjected to. It contains no GUM ARABIC, TRAGACANTH, ALBUMEN, SACCHARINE OR ALKALINE MATTER; therefore, it will not SAPONIFY, FERMENT nor RANCIDIFY. The addition of **Pancreatine** insures rapid and complete assimilation, enabling patients with very weak stomachs to easily retain and digest it.

Guaranteed to keep in any climate. Physicians supplied with samples (express paid) on application.

DUDLEY & CO., Pharmaceutical Chemists,

Laboratory, 397 and 399 Pearl Street. 423 Fulton Street, Brooklyn, N. Y.

MESSRS. DUDLEY & CO.: *Dear Sirs*—Though your EMULSION has not been before the profession a long time still I have used it quite extensively in my practice, and can truly say I think it one of the most elegant preparations of Cod-liver Oil I have ever prescribed. I find it can be readily taken and borne by the most delicate stomach, and the PANCREATINE and PHOSPHATES make its administration desirable in a large number of cases other than phthisical. In fact, there are few cases of mal-assimilation and general debility in which its administration will not do good; and it gives me pleasure to recommend it to my professional brethren.

1179- HOMER L. BARTLETT, M.D., Brooklyn, N. Y., Consulting Surgeon Kings County Hospital.

NEW REMEDIES.

FLUID EXTRACTS.

Coto Bark.—From BOLIVIA. Almost a specific in acute and chronic diarrhœa, cholera morbus, etc.

Cascara Sagrada.—(Rhamnus Purshiana.) From the PACIFIC SLOPE. A certain remedy for habitual constipation; and very useful in all cases where a laxative or cathartic is indicated. Beware of the fluid extracts of spurious varieties of this bark.

Folia Carobæ.—From BRAZIL. A powerful alterative, which exerts a marked curative action in syphilis, scrofula and kindred disorders.

Rhus Aromatica.—A remedy in diabetes, and other diseases of the genito-urinary organs.

Damiana.—(Turnera Aphrodisiaca.) From MEXICO. The best known aphrodisiac. Of great value in impotence, spermatorrhœa, and loss of sexual appetite.

Boldo.—(Peumus Boldo.) From CHILI. The new tonic. Very useful in dyspepsia, hepatic torpor, yellow fever, etc.

Berberis Aquifolium.—From CALIFORNIA. Has marked alterative and tonic powers, and has been used with extraordinary success in salt rheum, psoriasis, eczema, scrofula and syphilis.

Black Haw.—(Viburnum Prunifolium.) From the UNITED STATES. Employed to prevent abortion and miscarriage.

Grindelia Robusta.—From CALIFORNIA. A valuable curative agent in asthma and diseases of the air passages.

Grindelia Squarrosa.—From CALIFORNIA. Anti-malarial. Used in enlarged spleen and other malarial diseases.

Cereus Bonplandii.—(Cereus Grandiflorus and Cereus McDonaldii.) From MEXICO. Heart sedatives. Very useful in controlling functional and organic disturbances of the heart.

Kaki.—(Diospyros Kaki.) From JAPAN. Peculiar action on the mucous surfaces. Useful in mucous dyspepsia, typhoid fever, etc.

Cercis Canadensis.—Indigenous. A positive remedy in chronic diarrhœa, dysentery, etc.

Jaborandi (diaphoretic). **Guarana** (sick headache). **Fucus Vesiculosus** (anti-fat).
Bearsfoot (enlarged spleen). **Coca** (nervous stimulant). **Kava Kava** (Gonorrhœa).
Eucalyptus Globulus (antiseptic and anti-malarial). **Yerba Santa** (coughs).
Yerba Reuma (catarrh). **Wood Betony** (dyspepsia). **Ustilago Maidis** (oxytocic).
Penthorum Sedoides (catarrh). **Soap Tree Bark** (tooth wash).

CRUDE DRUGS.

Goa Powder (ringworm and diseases of the skin). **Gurjun Balsam** (a substitute for Copaiba).
Alstonia Constricta (a substitute for Calisaya).

SUGAR-COATED GRANULES.

Calcium Sulphide 1-10 gr. (for the cure of boils and carbuncles).

Our limited space prevents our describing in detail the history and application of each remedy, but to those interested in NEW REMEDIES, we will say, that we can furnish interesting information relative to the above new drugs.

PARKE, DAVIS & CO.,

DETROIT, - MICHIGAN.

Our New Remedies can be procured of the Drug Trade throughout the United States. By specifying **"P., D. & Co.'s"** in all cases, you will ensure reliable preparations of the **true drugs.**

PARIS EXPOSITION, 1878.

We take pleasure in stating that we were awarded a

SILVER MEDAL

FOR OUR EXHIBIT OF

SOLUBLE-COATED PILLS

AT THE

Universal Exposition, Paris, 1878.

This being the *only Silver Medal* (the HIGHEST RECOMPENSE awarded to Pills), is conclusive evidence as to the superior merits of our Soluble-Coated Pills, as compared with all other kinds and justifies the claims we have always made for the excellence of our manufactures.

W. H. SCHIEFFELIN & CO., New York.

LAWTON'S

ABSORBENT COTTON

FOR

HOSPITALS, DISPENSARIES, PHYSICIANS, DENTISTS, DRUGGISTS, PHOTOGRAPHERS, ETC., ETC.

The article furnished by us will be found superior to any other, on account of the facilities we possess for the manufacture, and the care taken at every step of the process.

Not only in general surgery, but especially in gynæcological practice, Absorbent Cotton has found great favor. It differs little from ordinary cotton in appearance, except in its uniformly fine quality and pure white color, freedom from all impurities — being entirely cleansed from oil, resin and all foreign matter.

The property of instantly absorbing liquids, its exquisite softness and great cheapness render it an invaluable substitute for Patent Lint, Charpie or Sponge.

We put up our Absorbent Cotton in neat and convenient packages, containing one pound, one-quarter pound, and two ounces.

A descriptive Circular will be forwarded on application. Samples containing two ounces will be sent, free of postage, on receipt of twenty cents.

PEPTONIC PILLS.

Pepsin, Pancreatin with Lacto-Phosphate of Lime and Lactic Acid.

(COPYRIGHT SECURED.)

This pill will give immediate relief in many forms of Dyspepsia and Indigestion, and will prove of permanent benefit in all cases of enfeebled digestion, produced from want of proper secretion of the Gastric Juice. By supplementing the action of the stomach, and rendering the food capable of assimilation, they enable the organ to recover its healthy tone, and thus permanent relief is afforded. One great advantage of the mode of preparation of these pills is the absence of sugar, which is present in all the ordinary Pepsin and Pancreatic compounds. In this form, the dose is much smaller, more pleasant to take, and is less apt to offend the already weak and irritable stomach. The results of their use have been so absolutely satisfactory, that we are confident further trial will secure for them the cordial approval of the Medical Profession and the favor of the general public.

Each pill contains one grain of pure PANCREATIN, which is equivalent to 10 grains of the ordinary or Saccharated usually prescribed and dispensed. Physicians will appreciate the great advantage of this mode of administration, the increased benefit to the dyspeptic being due to a full and effective dose of each, freed from unnecessary bulk, and really hurtful addition of sugar. A single pill will give immediate relief.

DIRECTIONS:—Take one pill immediately after eating or when suffering from Indigestion, Lump in the Throat or Flatulence. For children, reduce the pill to powder and give one-fourth or half, according to age.

Lecture.

FLATULENCE AS A SYMPTOM OF DYSPEPSIA—ITS CAUSE AND TREATMENT.

Delivered at the Philadelphia Hospital,

BY JOHN M. KEATING, M.D.,

One of the Attending Physicians.

REPORTED FOR THE MED. AND SURG. REPORTER.

Gentlemen:—This morning I have the pleasure of bringing before you a case that may serve as a text for my lecture, and aid in fixing your attention upon the subject, not frequently dwelt upon in hospital clinics. The patient before you was admitted to the hospital a few days ago, having been an inmate of the House of Correction for several months. Her age is about 25, her temperament of the most marked emotional type, her family history as uncertain as is usual in her position in life, and her previous history more a matter of conjecture than based upon any reliable facts. In such a case you have to begin at the beginning; take nothing for granted; place no reliance upon statements, but depend upon your own examination for the correctness of the diagnosis. I may say that after careful inquiry it has been reported to me that her disorder is confined to the abdomen. So, eliminating all other points for discussion, we will consider the present condition of the viscera. I find her abdomen enormously distended, as much so as if she were at the full period of pregnancy. She states that to this enlargement she has repeatedly called attention, and that numerous physicians, after careful manipulation, have detected a tumor in the central portion of the abdomen. This tumor was present when I first saw the case; its character I will give you in a few moments. What our patient most complains of is a distended abdomen, extreme hyperæthesia, particularly over the points of distention, general nervousness, sleeplessness, in fact, all the concomitants of a hysterical condition. What is the cause of this enlargement? We will determine this by the four modes of physical exploration, inspection, palpation, percussion and auscultation. You will notice that the shape of this enlargement is somewhat conical or pyriform; that is to say, the centre of the abdomen projects and the sides are symmetrically enlarged. There is no lateral bulging, no contour line of a tumor in either flank, no evidence of an inter-pelvic growth causing a projection from either iliac fossa. Therefore, hepatic, splenic, and ovarian tumors are rejected. You will also notice from this that the presence of ascites is not indicated. But strange as it may seem, having thus carefully eliminated growths and tumors that are lateral, I find upon palpation (you notice how extreme is the hyperæsthesia when I place my hand upon the patient) a marked tumor, rigid and firm, upon one side of the median line, and as I endeavor to define its edges and make more sure of its presence, by comparison with the healthy side, I find another in position directly opposite. The patient becomes rigid; her knees are drawn up firmly, flexing the thighs upon the pelvis; she complains of pain, which the *slightest* touch causes; in fact, as I endeavor to define these masses, I notice that at times the complaint comes even before my hand has come in contact with the skin. To avoid delay, let me say that upon a previous examination, when flexion of the thigh was strictly forbidden, and the patient's

emotions somewhat controlled, the masses that are to-day smooth, round, and firm, and of no small pretensions, were not discoverable. Their presence is transient; their cause muscular rigidity; they are nothing more than the powerful knotting of a firmly contracted rectus abdominis muscle; so-called phantom tumors. Percussion gives us a loud tympanitic note over the entire abdomen, but of higher pitch and greater tension in the centre, where the greatest enlargement seems to be. Auscultation shows that the percussion note has given us a correct interpretation; the gurgling heard, and increased if pressure be made upon the flanks at the time the stethoscope is in position, shows the presence of air in the small intestine.

We have therefore determined that our patient's large size depends upon an accumulation of air or gas within the small intestine, and as this is one of the most common symptoms in many cases of dyspepsia, I bring her before you that we may study its causes. The gaseous contents of the intestine, large or small, may be of two kinds: that arising from fermentation of food, and the presence of atmospheric air; the latter gains entrance during the act of swallowing. Food of the starchy character is, of course, more apt to produce flatulence than any other, and certain of other articles of diet, particularly eggs, will invariably cause an accumulation of sulphuretted hydrogen, if the digestive juices are not secreted in sufficient amount to prevent decomposition. The mucus of intestinal catarrh, particularly in children, may decompose, and tympany result; or again, paresis, or paralysis of the intestinal walls, may be consequent upon typhoid or other fevers. The sudden accumulation of flatus, caused by any of the conditions just mentioned, may give rise to symptoms requiring immediate treatment, and to these cases I will now call your attention. At the cæcum, where, as you know, obstructions from accumulation are not uncommon, a sudden descent may be made by a monsoon from the small intestine, and closure of the valve-like opening take place, either from kinking of the intestine or from the infarction of matters brought down with the pressure. The cause may be indigestion, irritating food, or cold, and your patient, suffering the most intense torture, fairly writhes in his agony. The abdomen will become enlarged, its shape will be pyriform, like that of the woman before us.

To such a case I was called only the other night; the patient, a lady, was advanced in years, very delicate, and one who, following the usual habit of a sedentary life, neglected her bowels. Her agony was intense; the pain was paroxysmal; the umbilicus protruded; the abdomen was as tight as a drum.

After careful manipulation I detected a tumor, irregular, and feeling like a mass of putty beneath my firm pressure, in the right iliac fossa. There was an attempt at regurgitation of air, and vomiting gave relief for a time. What was the treatment? First, relief of pain, a hypodermic of morphia and atropia ($\frac{1}{2}$ gr.–$\frac{1}{60}$ gr.); then the administration of large draughts of hot water with gin, to endeavor to cause relief by vomiting or regurgitation; a few drops of chloroform on a handkerchief anticipated the action of the narcotic. But, gentlemen, though this treated the symptoms evidenced by disordered action, the cause that clogged life's machinery was still doing its work. While the morphia controlled the pain, several doses of calomel ($\frac{1}{6}$ gr.), given hourly, upon the tongue, did its work, and when the last dose, amounting in all to but one grain, had been given, the following mixture was ordered every two hours, to continue the effect:—

℞. Magnesii sulph., gr. ss
Acid. sulph. aromat., gtt. x
Ext. prun. virg., fld., f. ʒ ij
Aquæ fluvialis, f. ʒ ij.

Hot mush poultices applied to the abdomen, covered by oiled silk, small quantities of wine-whey as the only nourishment, and absolute rest. Next morning a *large clyster* of warm suds and ol. ricini was given, and the result of this quiet, persistent treatment was the passage of numerous enormous stools, the partial diminution of the tumor, and the immediate expulsion of the gas in the small intestine. Having once secured an opening for the free passage of wind, massage, or kneading of the abdominal walls, furthered its progress; this I ordered done every night; bland unirritating diet, an occasionally nocturnal dose of the following mixture, and enemata to assist, if necessary, in the early morning:—

℞. Syr. sennæ, B. P.,
Vin. xer., āā f. ʒ ij.
Take at night.

But after a distention of this sort the muscular coats of the intestine need stimulation; their tone has been impaired, and a tonic is demanded. For this purpose my patient took regularly the following, three times daily:—

℞. Tinct. nucis vom., gtt. v
Elix. cinch. calys., ʒ ij
Tinct. gentian comp., ʒ ij, in water.

I have endeavored to familiarize you with two forms of flatulence in the small intestine, the one chronic and hysterical, the other acute. I

may add that you can have all varieties grading toward either of these forms; the symptoms bearing a close resemblance to either of the cases recited. For instance, a tea-drinking servant girl, whose indoor life and irregular habits have rendered her a fit subject for dyspepsia, will come to you with the following complaints: Great flatulence after eating, constant eructation of wind, acid stomach or vomiting, a feeling of fullness in the epigastrium, and the necessity of loosening the clothes to give relief after eating. Headache, no appetite and constipation complete the list of ailments. Now, in such cases exclude ulcer of the stomach, which you know is accompanied by pain, localized and burning, with occasional vomiting of blood, and you will have a complete case of the sub-acute form of gastric or enteric dyspepsia. In the treatment of such a case you should first order a laxative; for instance, a couple of pil. rhei comp. every other night. Then, depending upon the severity of the symptoms, pursue either of two courses: if the patient really is a great sufferer, and the disease has lasted for some time, and there is great epigastric tenderness, you may be sure that the mucous membrane is affected with a mild catarrh, and you can order nitrate of silver, with ext. conii, in pill form, these being given when the stomach is at rest. Milk diet at regular intervals should be enforced. But if the case is of a milder type, you can order your patient a powder of bismuth subnit. and pepsine, to be taken before eating, or charcoal in good sensible doses. The best way of administering these large powders is to have them put up in gelatine capsules, or if you live in a city have them put up in form of compressed pill. When the case is of a still milder type, that usually found in a higher rank of society, and where a feeling of discomfort and fullness is the sole complaint, with nausea, nothing acts so admirably as creasote, or probably still better, salicylic acid, in a mixture with aromatic spts. ammon. The association of cardamom, in the form of compound tincture, aids as a carminative. But bear in mind the lesson of the case of to-day: all flatulence is not due to decomposition of food; the hysterical element predominates in most cases of young women whose habits or occupation tend toward dyspepsia. Your antiseptic or neutralizing treatment will be merely palliative; the symptoms of which your patient complains have a deeper seated cause than the irritation from the changes in the food. They are dependent upon an unbalanced nervous system, from emotional or nutritive causes. This reacts and clogs the machinery of glandular function; the digestive juices fail to be poured into the intestinal canal, food decomposes, irritates, or if the nervous element predominates, swallowed air inflates the viscera, and the patient resembles the one before us. Certainly, the indications for treatment under these circumstances are evident enough; you first of all give your attention to the nervous system.

Rest is the most important point in your treatment; rest of *mind*, allaying of nervous irritation; for this purpose your sheet anchor is *opium*. I have no hesitation in saying that in the treatment of these hysterical dyspeptics—and I consider every young girl with dyspepsia as one where the nervous system will be found sooner or later at fault—*opium* is far superior to the bromides. Do you fear the establishment of an opium habit? you have it in your power to conceal from your patient the composition of her dose; if you watch your case carefully, and take the reins in your own hands, you need have no fear. Of late I have used the following mixture at night, in these cases, and have found it to work admirably, giving a refreshing night's rest, no morning headache, calming nervousness:—

℞. Morphiæ sulph., gr. $\frac{1}{4}$
Acid. hydrobromic, dil., f. ʒ ss
Syr. tolutan., f. ʒ ij
Aquæ, f. ʒ ij.

A "dinner pill" given occasionally will keep the bowels regular. A half hour's rubbing of the abdominal walls, and kneading them at night, will greatly stimulate the intestinal peristalsis. You may give also in pill form the following, often used in this hospital with great success:—

℞. Acid. arseniosi, gr. $\frac{1}{30}$
Strychniæ sulph., gr. $\frac{1}{40}$
Ext. belladonnæ, gr. $\frac{1}{5}$
Cinch. sulph., gr. iss
Pil. ferri carb., gr. ijss. M

If your patient, as is often the case, is sallow, of muddy complexion, yellow conjunctiva, and a coated tongue, you will find that nitro-muriatic acid, with a bitter vegetable tonic, will be of advantage if given before meals. I prefer gentian to all others. Daily massage, out-door exercise, occupation, will soon reinstate your patient, reëstablish her functions, and cure the dyspepsia.

Having now devoted as much time as we can spare to the discussion of this form of flatulence, let me call your attention to that variety where the colon is the seat of the accumulation of gas. As a rule this is usually found in the two extremes of life. The diagnosis is easily made, for instead of the enlargement being found in the centre of the

belly, it will occupy the position of the colon, will be lateral, and will, by pressure, when excessive, interfere with the movements of the diaphragm, and be a cause of dyspnœa.

You will frequently find this form of flatulence associated with fatty degeneration of the heart, and often is it seen in cases of general fatty infiltration, where the enormous deposit that frequently occurs keeps patulous the large intestine. Fæces will be in the colon, and for want of proper peristalsis remain to decompose; or again, the gases may accumulate there, for want of proper propulsive force to overcome and relax the sphincters of the outlet. Weak abdominal walls will then be the cause. In such cases a tonic stimulating purgative is required; a pill of assa-fœtida, aloes and rhubarb, with or without nux vomica, or daily enemata, containing ol. terebinth in large quantity of the vehicle. I have seen digitalis act well when weak heart is associated in such cases. Then, again, massage to the abdomen is a means of great value, and with it may be used a stimulating liniment. Small doses of strychnia, given in form of granules, is often indicated. Frequently you will find such cases among children, as the sequel of the many causes of summer catarrh. From continuous irritation the intestine has lost its tone, and children will often be brought to you after a severe summer with this complaint. In them I have used with success vin. pepsin with tinct. nucis vomicæ and port wine, given one-half hour before nursing. The difficulty of always being able to give enemata to children, among the poor, has caused me to adopt a simple means that bids fair to be successful. The ordinary gelatine capsule, minie-ball shaped, of a large size, is filled with castor oil and introduced into the bowels. Of course, any oil can be used, and substances that are required to be used by enema can be put in this vehicle.

Communications.

STRICTURE OF COLON, WITH COMPLETE OCCLUSION—TYPHO-MALARIAL FEVER. WITH POST-MORTEM.

BY G. C. SAVAGE, M.D.,
Of Jackson, Tenn.

Charlie C., aged twenty years, a student of law, came to me complaining of vertigo and some headache, many months preceding the attack of fever of which I shall soon give a history. Knowing that he was a very hard student I thought that perhaps his trouble was due to some congestion of the brain, and prescribed accordingly. After following my directions a short time he expressed himself somewhat relieved. Soon after this he went home, and having failed to take any of his medicine with him, was advised while there to take "Simmons' Liver Medicine" regularly, with the assurance that he would soon obtain entire relief from his vertigo. The liver medicine produced free evacuations from his bowels every day while taking it; and the vertigo, he said, was cured. On stopping this medicine his bowels became again constipated, and vertigo returned as before. He resumed his liver medicine, and continued to take it until prostrated by fever.

His breath for months was most foul, even when he kept his teeth clean. He was in the habit, before going into company, of chewing some aromatic substance.

For a long time he was constantly belching. From his frequent eructations one would have judged his stomach all the time distended with gas.

His skin was sallow for a long time previous to his confinement to bed; and his face, inclined to be bumpy, had here and there pigmentary spots.

His general health had not been good for months. I have sufficient evidence for believing that constipation had been growing on him a long while, though he had never complained to me of it. He said to a friend, some time before he was stricken down, "I have to take something all the time, to act on my bowels."

After being feverish, with bowels constipated, and suffering some from headache for a week or more, I was called to see him on the morning of August 4th. I found him with a temperature of 104°, pulse 100, full and round; no headache or pain in any part at this time; no nausea or vomiting; skin moist; urine free; tongue heavily coated, and no movement from bowels for thirty-six to forty-eight hours. I gave him calomel, grains ten, to be followed in six hours by a dose of castor oil; and at the same time prescribed tincture of gelsemium and quinine alternately, in large doses. In the evening his temperature was down to 101°; bowels had acted freely, causing four or five large, dark and offensive movements; and he was under the influence of quinia. The urine, highly colored at first, was sufficiently free, and remained so throughout.

He was under my observation and treatment eight days, and the following is a brief history after the first day: His morning temperature on

the second day was 101°, and after the third morning, when it was 102¾°, it did not go higher than 102° nor lower than 101°, reaching the latter only on the eighth day. On the second day his evening temperature was 103°, and on the third 101½°. On the fourth day, about noon, he had a chill, followed by high fever, his temperature rising to 104¾°, but on the evening of the same day it was down to 101¾°, and after this the evening temperature was not lower than 103° nor higher than 103¾°, while he remained under my care.

His pulse was not very frequent at any time during the eight days, the extremes being 78 and 102, and the average 84; and it was full, round and resisting.

His tongue was heavily coated throughout the eight days; but under treatment it was gradually cleaning off from the edges; and notwithstanding his foul breath, he complained of no bad taste.

He had no nausea or vomiting, except on one occasion, when it was due to medicine; no tenderness over the stomach; frequent eructations; no pain anywhere in the cavity of the abdomen; bowels constipated, but would act freely when taking medicine, the discharges being dark and offensive. He had eighteen movements from the bowels while under my care, all the result of medicine given at different times for that purpose; no noticeable tympany.

He complained of no headache or other nervous symptoms, only he was a little restless on one or two nights. His skin, moist throughout, was frequently bathed with perspiration having a very unpleasant odor.

Treatment.—I gave him a fever mixture and quinia throughout, changing the form of the fever mixture occasionally, to meet indications; gave him a gentle purgative four times; and had him sponged occasionally.

My diagnosis was typho-malarial fever, a disease common in this part of the country, usually continuing about three weeks, sometimes four.

On the 8th day of his sickness, after a consultation with Dr. Thompson, I consented to his being moved to his home in Henderson, 18 miles by rail south of this city, believing that the move would not injure him. He was gotten on the train without much fatigue and soon reached home, not feeling much worse for the move. He now passed into the hands of Drs. W. J. & J. A. Crook, my preceptors in medicine, who kindly furnished me reports of the case as the disease continued. These reports show that he continued for ten days about as he was when under my care, there being some improvement toward the latter part of the ten days. The plan of treatment they adopted did not differ materially from that I had pursued. His condition, to all appearances, was hopeful up to the morning of August 22d, the 18th day from the time he was first taken to his bed. Now he was seized with severe pain in the left iliac region; fever higher; pulse more rapid; bowels commenced disturbing; tenderness great; had two movements from the bowels soon after pain set in. Anodynes relieved pain somewhat and he rested comparatively well during the forenoon and a part of the afternoon; but toward evening the pain returned and was more severe; abdomen very much disturbed and tympanitic; great tenderness in left iliac region, extending over into supra-pubic region; temperature 106; pulse 120; no headache; no delirium; no movement from bowels since morning; occasional vomiting; great prostration. Turpentine stupes and hop poultices were applied, with relief; but on the following morning there were still pain, tenderness and tympany; temperature 99°, and pulse 100 and feeble; perspiration very free; no movement from bowels; tendency to great prostration. During the day the temperature went higher; the pulse became more frequent; and the vomiting and other symptoms continued. A blister was applied over lower part of abdomen, specially over left iliac region; an enema was given, which produced one very slight movement from bowels; other enemas were given, but came away without being stained; castor oil was given also. The stomach remained very irritable, the matter vomited being bilious. Stimulants and nourishment were given freely.

I was sent for on the evening of the 23d, he having been my patient at first, and arrived at 8.15 same evening. After a consultation with the Drs. Crook we decided that the chief indications were to keep up strength, to relieve tympany and to act on the bowels. To meet the first indication we gave quinia hypodermically, and stimulants and nourishment by mouth and rectum. For the relief of the tympany we gave turpentine by mouth, and turpentine and mixture of assafœtida by rectum, without being able to relieve. Oils, simple and concentrated, had no effect on bowels; irritating and distending enemas accomplished nothing. The pulse beat 160 times per minute, was feeble and soft, and when lying on right side would intermit one beat after eighth or ninth; respirations 40; mind clear, but some stupidity.

Having failed to give him any relief, we decided, at 2 A.M. on the 24th, that he was laboring under obstruction of the bowels, the first symp

toms of which had set in two days before. We announced the hopelessness of the case to the family, but continued to work, remaining with him all the time. Gave croton oil, gtt. ij., but did not repeat; also gave sulphate of magnesium, and frequent distending enemas, but all without effect. We continued nourishment and stimulants and repeated occasionally the hypodermic of quinia. The vomiting of bile continued, containing shreds of mucous membrane and a substance resembling fecal matter in a state of fine division.

On the evening of the 24th we told him he must die unless relieved by nature, for we had despaired of accomplishing anything by art. He received the announcement courageously, and when told that he was dying of some form of obstruction of the bowels, he requested that his body should be opened after death, saying "I may be able to do more good in my death than I could accomplish in a long lifetime," meaning that he wanted a report of his true condition given to the medical world.

His mind remained clear up to midnight of the 24th when he became a little delirious; the vomiting became more frequent, every few minutes; pulse remained at about 160; respirations 40 or more; very feeble, lying by preference on right side, sometimes on back. At 2 P.M. on the 25th he revived some, seeming better than he had been for hours; but soon he was pulseless and entirely delirious; his respirations grew less frequent and more labored; and after a few gasps he ceased to breathe at 4.15 P.M., August 25th, twenty-one days from the time he took to his bed, and three and a half days after first symptoms of obstruction of bowels set in.

Sectio Cadaveris.—In due time after his death, having obtained the consent of his parents, we commenced the autopsia cadaverica. By inspection of the surface of the abdomen we found three tumors, all in the umbilical region, two situated in the upper part of this region, one inch or more above the umbilicus, one on each side of the linea alba; the third situated to the right of the linea alba, one inch below the umbilicus. The abdomen was moderately distended and tympanitic, the greatest tympany being over the tumors.

By a crucial incision we opened the abdomen; found some serum and a little pus in the lower part of the cavity; the omentum above and behind the small bowel; the stomach normal in color and distended; the duodenum and jejunum healthy in appearance and distended; upper part of the ileum healthy, while two and a half or three feet of the lower part was in a state of mortification, the part most mortified lying in the left iliac region; did not open the ileum, but by passing it gently between thumb and finger could detect no enlargement of Peyer's patches or the solitary glands (the mortified bowel gave way under its own weight, about two feet from the ileo-cæcal valve); cæcum and lower part of the ascending colon healthy and much distended with gas. Next we came to a stricture of the colon, ten inches long, six inches of the stricture being in the upper part of the ascending colon, and four being in the beginning of the transverse colon; at the hepatic flexure was a mass of hardened fæces, weighing ninety grains, around which the gut was tightly contracted. The stricture had led to complete occlusion; following this stricture was a portion of healthy transverse colon, five or six inches long, and very much distended with gas (this part of the bowel made the two tumors in the upper part of the umbilical region); following this was a second stricture, eighteen inches long, with complete occlusion, eight inches occupying the last part of the transverse colon and ten inches the upper part of the descending colon; at the splenic flexure of the colon was a second mass of hardened fæces, weighing one hundred grains, and around this the bowel was closely contracted; each stricture was cord-like in appearance, and not larger than a man's little finger, except at the seat of hardened fecal masses; the strictures were laid open with scissors; the coats of this part of the bowel were found three or four times thicker than normal, and the width, when laid open and stretched, was not more than half an inch; the lower part of the descending colon, the sigmoid flexure and the rectum were in a normal condition; the liver and spleen were not enlarged.

Reflections.—I believe that the strictures of the colon in this case were not of recent date, but that they commenced forming months if not years ago; and I further believe that the exciting cause of these strictures was the two masses of hardened fæces; that these masses, perhaps at the same perhaps at different times, got into pouches of the colon, one in a pouch at the hepatic flexure and the other in a pouch at the splenic flexure of the colon, and remaining for a time set up some irritation, which caused nature to make an effort to rid herself of these irritants, the effort being a contraction of the coats of the colon, in this way trying to dislodge the masses, that they might be passed on and out; that the masses remaining, the contraction continued to go on, the contracted parts gradually

lengthening and the bowel growing less by degrees, until finally the strictures were of the length found and the occlusion complete. By reference to the report of the post-mortem it will be seen that a mass of hardened fæces was near the centre of each stricture.

His vertigo, eructations, foul breath, constipation, sallow complexion and spots on face, all now have a meaning to me they did not have before. I believe they all point to the strictures of the colon, the constipation being due to the narrowing of the bowel, the vertigo due to the constipation, the foul breath and eructations due to gas, generated in the bowel, finding its way up into the stomach, thence out by the mouth. I would say here that there was no sign of disease in the colon, save the contraction.

While I still believe that the fever, for the three weeks preceding his death, was typho-malarial, I now think the typhoid symptoms in his case were due to the saturation of his system with noxious material taken up by the absorbents from the bowel above the contracted parts; that this material, not being allowed to pass off by the bowels as readily as it should have done, was taken again into the system and an effort made to eliminate it in some other way; and that this poison acting with the poison of malaria produced the fever in question.

I believe this case to be the first of the kind ever reported in this country, and I invite comment, especially from medical authors.

STRANGULATED HERNIA RELIEVED BY TEARING OR STRETCHING THE ABDOMINAL RINGS.

BY J. W. YOUNG, M.D.,
Of Bloomfield, Iowa.

On the morning of September 10th, 1879, I was called ten miles in the country, in consultation with Dr. Edwards, to see Mr. J. M., aged 56, suffering with strangulated hernia, and requested to bring the necessary instruments to open the sac and return the contents. I arrived fifteen hours after strangulation, and found patient resting under a huge dose of morphia. Dr. Edwards stated that strangulation had occurred several times during the last 25 years, but that the patient and friends had succeeded in returning the hernia without surgical aid. Trial was made for two or three hours by the patient, without success, and Dr. Edwards was called. Patient was placed on an inclined plane and taxis tried at different times by the Doctor, for several hours, but finally the Doctor and friends became discouraged and a messenger was dispatched for me, and a large dose of morphia was given the patient, to relieve the horrible suffering till my arrival.

Upon examining the case I found a large inguinal tumor extending into the scrotum, tense and inelastic to the touch. I arranged the instruments on the table I should be likely to use in cutting the stricture, if I should be compelled to resort to this bloody treatment, but determined, if possible, to try in this case a theory I have of tearing the stricture instead of cutting. The patient was placed on a board about five feet long, with head supported by a pillow. Half the board was on the bed and the head end was supported by a chair. Complete anæsthesia was made by chloroform, and the chair taken from under the head end of the board and the head lowered to the floor while an assistant stood on the bed and held the legs over the end of the board. I dragged the abdominal viscera as near the diaphragm as possible, and tried to reduce by taxis for some time, but the tumor seemed immovable. I then invaginated my index finger in the scrotum, gradually forcing it along the tumor till I could feel the stricture. Dr. Edwards kept up complete anæsthesia of the patient. Everything was relaxed as much as could be, and my patient completely insensible. I forced my index finger under the structures surrounding the neck of the tumor, little by little, till the first point rested under the perplexing bands. I now, by sheer force, pulled upward and inward till I felt the tissue tear over my finger. I dilated the ring in this manner as much as I thought proper, and then without trouble or delay returned into the abdominal cavity the relaxing tumor.

A bandage and pad was applied over the abdominal rings, to prevent a protrusion from coughing, sneezing, etc., and patient placed comfortably in bed, by which time he had partially recovered from the effects of the chloroform.

I left the case in the hands of Dr. Edwards, directing him to keep the patient quiet, apply turpentine over the bowels, and combat inflammatory symptoms as they should come up. The patient was kept in bed four days, with but little nourishment, and somewhat under the influence of opium, and was allowed after this to get up and walk about a little. Complained of great soreness over the inguinal region, but no great constitutional symptoms followed, and was able in about ten days to go about the farm.

I do not claim this treatment is applicable to

all cases of strangulated hernia. It could not be employed in femoral hernia, and if gangrene had taken place it would be bad practice to return a gangrenous gut into the abdominal cavity; yet I claim in the above case it was the best possible treatment. There was no danger of wounding the epigastric artery; the peritoneum was not exposed; the dangers of inflammation greatly reduced; and the chances are favorable to a speedy radical cure of the hernia by adhesive inflammation.

I do not remember having seen or heard this tearing method recommended, and I report this case and its treatment for the purpose of eliciting criticism from the profession, in the REPORTER.

HOSPITAL REPORTS.

PENNSYLVANIA HOSPITAL.

CLINIC OF DR. R. J. LEVIS.

REPORTED BY J. F. SOUWERS, M.D.

The Treatment of Fracture of the Femur.

I propose this morning to offer some remarks in regard to fractures and fracture dressings of the thigh, and in illustration to present to you the case now in the arena. This man has just been brought into the house, and is a typical case. His history is as follows:—

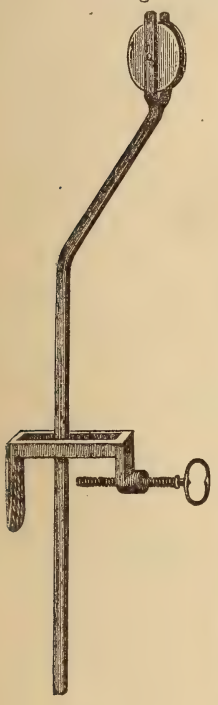
While driving, the bit in the horse's mouth broke, and to prevent a run-away the man jumped from the cart, seized the horse by the nose, and thus, probably, startled the animal; the horse started on a run, the wheel passed over the man's foot, which is almost uninjured, but the hub struck him on the thigh, which now presents a swollen, ecchymosed appearance. In making an examination in such cases an anæsthetic should always be given, as you thus relieve pain, cause relaxation of the muscles, and are enabled to make the examination without any opposition from the patient. Upon visual examination I find the limb to be exceedingly muscular; on manual exploration I find the parts soft, rather tumid, and a sensation as if the integument was strongly forced up; the tumidity might be due to rupture of the femoral artery, from the ends of the fragments having torn the vessel. To discover whether this complication has taken place I feel for the posterior tibial artery, just where it winds behind the internal malleolus. In this case the femoral may be somewhat bruised, yet the pulsation in the tibial is good, consequently we conclude that the artery above is not ruptured. I now have a little extension made while I seize the two ends of the fragments; on examining I find marked crepitus and unnatural mobility. On measuring the limb I find more or less shortening, thus giving the typical symptoms of fracture. It is a case of ordinary oblique fracture of the femur in the middle third.

Let us now examine as to the shortening which has taken place. As ordinarily measured a line is run from the ant. sup. spinous process of the ilium to the centre of the inner malleolus; but these points are too inexact to be relied upon. The irregular manner in which the patient lies, and the obliquity of the pelvis, act as sources of fallacy. The limbs in the large majority of people are not symmetrical in their normal state; an exhaustive series of experiments has been performed by Drs. W. C. Cox and J. B. Roberts, formerly residents in this hospital, bearing on this point. In the skeleton the greatest difference often exists; indeed, one leg may be $\frac{3}{8}$ to $\frac{5}{8}$ of an inch longer than the other. In making these differential measurements in my own practice I pursue the following plan: just below the ant. sup. spinous process you will find a notch; in this I catch my finger nail, and thus mark the skin; this is done on both sides, the patient having been first placed on a hard, flat surface, the body in a straight line, and the heels together. From the mark above mentioned to the lower border of the inner malleolus I then run my line; on applying this rule to the case before me I find about one inch of shortening, this being about the average in these fractures of the thigh, though it may amount to two inches; if a man fall from a great height the impact of the blow will cause more shortening.

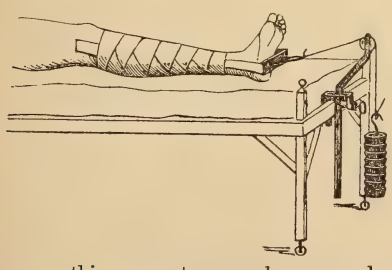
We now come to the question of treatment; and first, as to the bed, which should be so adapted that the patient shall not be compelled to move for any purpose, as it is absolutely essential that he shall retain one position during treatment. An ordinary flat mattress will do, though such a one as I show you here is preferable. The mattress may be made of corn husk or curled hair; the latter is, however, far preferable, as the hair does not pack under the patient in ridges, as the husk does; further, if the hair absorb pus or other discharges, it can readily be washed and again used; further, it makes a more solid and level support for the injured limb. From the mattress a **U**-shaped piece should be cut, so that you can remove and replace it at pleasure, and in its place may be introduced a bed pan. The patient can thus relieve himself without disturbance. It is important that you treat fracture of the femur in the straight position, using sand bags for the lateral support of the bone, and making extension and counter extension. If the fracture is high up the psoas and iliacus muscles tend to draw the upper fragment upward and outward; in consideration of this some treat the thigh in the flexed position, believing that they thus bring the parts into better apposition; but I think that this is a disadvantage, as those muscles which come from the pelvis are inserted into the thigh bone at a mechanical disadvantage when the limb is straight, but if you flex the femur they work to better advantage, and the change of position may do more harm than good.

We now proceed to dress the fracture, first having brought the ends into apposition. Taking two strips of adhesive plaster, 2½ to 3 inches in width, I place them on either side of the limb, taking care to carry them up about two inches above the seat of fracture. I do not make extension from the leg alone, for the reason that constant traction on the knee joint would tend

to weaken its ligaments; the distal ends of these strips cross on a foot-board, which should be longer than the width of the foot, say from 3 to 4 inches. The strips are now notched so as to snugly fit the limb, a bandage applied so as to support the adhesive strips, the sand bags tucked into the hollows of the limb, the extension cord attached to the foot-board, and we are ready for the extension apparatus, which should be convenient in form and inexpensive, portable, and readily and conveniently adjustable to various forms of bedsteads. It is also important that the amount of tension by weight can be estimated and varied according to the progress of the case.



I here show you an apparatus which answers all these requirements; the upright rod supports a pulley, over which plays the extension cord; this rod is held in position by an adjustable clamp. The rod and pulley can be adjusted by this clamp to any required height, while at the same time, the clamp will grasp a bar of any width at the foot of the bedstead, or it may be attached to any body that will afford sufficient security and steadiness. The amount of weight extension is effected by a series of one pound weights, through the centre of each of which is drilled a hole; these may slide on a rod bent into the form of a hook at the top, for catching in a loop in the extending cord, or they may rest in a cage, from which they can be removed at pleasure, without in any way interfering with the rest of the dressing. The



clamp on this apparatus may be reversed so as to grasp an under edge, when such a hold is more convenient. I devised this apparatus some years ago, for use in this hospital; it is also much used elsewhere. The foot of the bed being elevated, the patient's body acts as the counter extending force; or if more power is needed with restless patients, a perineal band is employed. Strong traction being made, the weights are attached to the extension cord; during the first few days I employ, in cases of muscular adults, about twenty pounds weight, in order to overcome the muscular tonicity; this is gradually reduced to twelve pounds or less during the course of treatment.

Medical Societies.

MEETING OF THE RHODE ISLAND MEDICAL SOCIETY.

A quarterly meeting of the Rhode Island Medical Society was held in Lyceum Hall, Providence, on Wednesday, September 17th, 1879.

The meeting was called to order at 10.20 A.M., the President, Dr. E. T. Caswell, in the chair. The records of the last meeting were read and approved.

Dr. S. R. Bronson, of Attleboro, a member of the Massachusetts Medical Society, being present, was introduced by the President. He gave some reminiscenses of his early connection with this society, of which he was formerly a member.

Dr. T. Newell, chairman of the library committee, gave an account of the Boston Medical Library Association, with a sketch of its foundation and history.

Dr. E. T. Caswell presented a specimen of calculus, weighing 126 grains, removed from a boy nine years old, by the ordinary lateral operation. In two weeks time the wound had entirely healed, and there had been no further trouble. The stone was $1\frac{1}{4}$ inches by $\frac{3}{4}$, and was undoubtedly of phosphatic character, with possibly a nucleus of uric acid. He also showed a specimen of 90 grains of phosphatic debris removed by the old operation of lithotrity, from a man over thirty, in two sittings. The patient had made an excellent recovery, and showed no further symptoms of stone. He said he had brought up this case for the purpose of showing the Society the instruments devised by Dr. Bigelow for rapid lithotrity and evacuation. This procedure, which had been instituted by Dr. Bigelow, had placed the whole matter of the treatment of calculus in an entirely new aspect, and was a grand contribution to the progress of surgical science. Dr. Bigelow had demonstrated the fact that the bladder could tolerate instrumental interference under ether for a much longer time than had been previously supposed. The speaker then showed Dr. Bigelow's lithotrite and evacuating tubes and bulb, and explained the operation. He also showed the lithotrite devised by Dr. Keyes, of New York. He then proceeded to give a summary of all the cases he had been able to collect in which the new operation had been performed. Nine were reported by Dr. Bigelow, thirteen by Drs. Van Buren and Keys, one each by Drs. Sands, Weis, J. C. Warren, Curtis, Parker and Morton. There were 28 cases reported and two deaths, but in one of these (Dr. Weis) the patient had lived thirty days and then died of surgical kidney.

The ages of the patients varied from 8 years (Dr. Bigelow's case) to 73. The time occupied in the operation, from 25 minutes to 3¾ hours (Dr. Parker's case). The amount evacuated at one sitting, from 60 grains to 744 grains. In the case reported by Dr. Parker there were three sittings at intervals of four or five days. The first lasted 1½ hours, and 228 grains were removed; the second 3 hours with the removal of 744 grains; the third, 3¾ hours with the removal of 706 grains. In all, with what the patient passed, the amount of the calculus was 1802 grains. The patient was entirely well in two weeks from the time of the first sitting. In conclusion, Dr. Caswell said that hereafter, doubtless, rapid lithotrity would be the operation in adults, in all cases except those of extraordinarily large stones, and the lateral operation would be the one to be employed in children.

Dr. George D. Hersey read a paper on "The Revision of the Pharmacopœia in 1880." The project for forming a Pharmacopœia of the United States originated in the New York County Medical Society, in 1817. The plan proposed, as stated in the "Historical Introduction" to the edition of 1820, was briefly as follows:—

That the United States and territories be divided into four districts. That a convention be called in each of these districts. That each medical society and medical school be invited to send one or more delegates to meet in a district convention, and form a pharmacopœia, adapted to the existing state of medical science. That each district convention appoint one or more delegates to meet in a general convention and submit to the same their pharmacopœia. That the general convention meet in Washington, for the purpose of compiling a National Pharmacopœia from the material presented by the district conventions.

A committee was appointed to correspond with the incorporated medical societies and influential medical men in the United States, and a circular letter was accordingly sent out the next year, 1818.

The design was popular, and delegates to district conventions were generally appointed. The district convention of the Eastern district met in Boston, June 1st, 1819, adopted a pharmacopœia and appointed delegates to the general convention in Washington. The other district conventions assembled and appointed delegates to the general convention, and the middle district also submitted the outlines of a pharmacopœia.

The general convention met in Washington, January 1st, 1820. The two pharmacopœias presented by the middle and eastern districts were duly examined and compared in detail, and their contents, with such additions as seemed desirable, were consolidated in one work, which was adopted by the convention as the American Pharmacopœia and ordered to be published. The pharmacopœia thus formed was designed to give uniformity to therapeutic nomenclature and secure medicines of a standard purity and strength.

The continual discovery of new remedies and new pharmaceutic processes rendered necessary decennial revisions, and conventions for this purpose.

The next convention assembles in Washington in 1880, and the question arises in this connection, What changes must now be made to bring the Pharmacopœia to the present state of medical practice?

To determine how far the last edition of the Pharmacopœia answers the requirements of the medical profession in Providence, I visited four of the principal apothecaries and examined the prescriptions they had dispensed during the months of July and August. The prescriptions I divided into five classes, after the plan suggested by Dr. Robert Amory, of Boston.

(1.) Those which contained unofficinal preparations, *i.e.*, those whose formulæ are known, but which are not recognized by the U. S. Pharmacopœia, as pepsin, salicylic acid, guarana, etc.

(2.) Those which contained certain proprietary medicines, or in other words, trademark preparations, such as lactopeptine, Horsford's acid phosphate, etc.

(3.) Those which called for proprietary medicines only.

(4.) Those composed of private prescriptions, known, for instance, only to the prescriber and the dispensing pharmacist, but not published.

(5.) Those containing only U. S. Pharmacopœia preparations.

The following table shows the result of this analysis:—

Class I (unofficinal)	483	16 per cent.
Class II (proprietary mixed)	136	5
Class III (proprietary only)	307	10
Class IV (private)	15	1—
Class V (officinal)	2099	68+
Total	3040	

An examination of this table shows that less than three-fourths of the prescriptions are officinal, and that more than one-tenth are proprietary preparations. So large a use of proprietary medicines is a matter of regret. It is unfortunate that their manufacture and sale should be encouraged by our profession. Who knows, for instance, when he writes for iodine? In a recent advertisement of somebody's "Iodo-ferro-phosphated elixir," I read that this elixir contains iodine, pyrophosphate of iron and the active principles of certain antiscorbutic and aromatic plants," which, by the way, are not named. The gentleman who prescribes such an indefinite compound ought not to criticise the people who have faith in blue glass and liver pads. The Pharmacopœia is, of course, closed against the flood of elixirs and ready-made medicines let loose by energetic chemists, but it must recognize every positive improvement, and admit the new remedies that prove to be worthy additions to our therapeutic resources. An examination of recently issued books on treatment and materia medica, especially such compilations as the National Dispensatory and Napheys' companion volumes on *Medical and Surgical Therapeutics*, shows a long list of officinal remedies which may be called the candidates for next year's honors. I will mention a few of the more important popular remedies not yet officinal. These are—

Aloin.
Ammonium Carbazotate
Amyl Nitrite.
Apiol.
Apomorphia.
Beberia Sulphate.
Boracic Acid.
Caffein.
Camphor Monobromide
Carbon Bisulphide.
The Cheap Cinchona Alkaloids.
Cicuta.
Codeia.
Coto Bark and Cotoin.
Datura Tatula.
Dialysed Iron.
Guarana.
Hydrobromic Acid.
Jaborandi and Pilocarpin.
Pepsin.
Picric Acid.
Pinus Canadensis.
Pulsatilla.
Propylamin.
Quinia and Morphia Bromide.
Salicin.
Salicylic Acid.
Sodium Silicatum.
Sodium Sulpho-carbolate.
Strychnia Acetate.
Sumbul.
Tonka Bean.
Viburnum.

Besides admitting to the officinal lists a judicious selection from such familiar remedies, the next edition of the Pharmacopœia should give the formulæ according to the metrical system of weights, instead of the Troy weights now recognized.

As the first edition of the Pharmacopœia sprang from the wants of medical men in various sections of our country, so now the revision is made in accordance with the suggested needs of the various medical and pharmaceutical societies and colleges.

Dr. T. Newell thought that many of the medicines which are so extensively advertised to physicians by means of samples are gotten up merely to make money.

Dr. J. W. Mitchell requested that members should report to the committee any alterations or amendments which they might think advisable in the Pharmacopœia.

Dr. Forsyth briefly reported a case of œdema of the glottis in which he had used hypodermic injections of ½ grain each of pilocarpine.

Dr. A. G. Browning read a paper on Faradization, as applied to muscular and cellular structures.

Dr. O'Leary said that this paper suggested a treatment of a class of cases that were generally discouraging and annoying. He had no experience in the use of electricity in such cases, but was glad to know that it was of benefit. In cases of injury to the joints, where there is a poor circulation, he supposed that Faradism would stimulate them. He had used the actual cautery often in that class of cases, and the hot and cold douche. He cited two cases of injury to the foot where he had used the actual cautery with good results. He said this was the treatment recommended by Dr. A. C. Post in this class of cases.

As a general thing patients to whom this kind of injuries happen are not in circumstances to admit their treatment by the specialist. Cases have been reported where cures had been made by the use of Faradism where the actual cautery had been used without effect.

Dr. L. F. C. Garvin said that in lumbago the use of liniments are often of no avail. During the month of August he had three cases. In the first case the man had been in bed two weeks. The pain was bilateral. He used acupuncture and gave immediate relief.

The second case was an acute attack, and was confined to the left side. Puncture brought on a spasm. Applied Faradism with immediate and great benefit.

The third case had been sick a week. After two applications of Faradism, was well. He gave turpentine in 20 drop doses three times a day for a number of days.

Dr. J. W. Mitchell said he had not used Faradism. In cases of lumbago he had depended upon the use of chloroform applications, externally, the application of warmth and the internal use of alkalies.

The President announced that the following named gentlemen would read papers at the next meeting of the society: Drs. S. S. Keene, Geo. W. Stanley, W. E. Anthony, R. U. Noyes and J. E. Tobey.

Dr. Lloyd Morton said that he thought there ought to be a change in the time of meeting of the Board of Censors. Physicians of the board in active practice find it difficult, if not impossible, to get here at half-past nine. He favored having the board meet on the day previous to the meeting of the Society, and making the secretary of the Society secretary of the Board of Censors. The subject was referred, for consideration, to the committee who were appointed to consider the changes advocated in the President's address.

No further business presenting the Society adjourned until the third Wednesday in December.

W. E. Anthony, *Secretary.*

Editorial Department.

Periscope.

Symptoms and Diagnosis of General Paralysis.

Dr. E. C. Mann says, in the Boston *Medical and Surgical Journal*—

In general paralysis, the ideal self runs riot—the man, not as he is, but as he has pictured himself, and as he would have himself be. In the inception of his disease the patient feels himself "bang up" and "perfect;" everything is "elegant" and rose-colored. His wealth is unbounded, and he orders "a million" cigars, and palaces built of gold and diamonds, with the utmost indifference and nonchalance, thoroughly believing in his capacity to do all these things. The patient's delusions are markedly progressive in number, absurdity, and exaggeration. Being rather feeble, he imagines himself capable of immense sustained exertions. In general paralysis, the mental processes which are the most automatic are the last to be affected; the patient

entertains perfectly reasonable ideas about his actual self, and although possessing thousands of ideal dollars and estates, will tell you correctly that he earns but ten dollars per week, as this idea has, from frequent and constant repetition, become automatic. In the same manner, a patient under my care tells me correctly that his suit of clothes cost fifteen dollars in London, and in the same breath says that he has ordered a silk velvet suit with diamond buttons. At the present moment he considers his health perfect, but acknowledges that in the past he has had many sicknesses and infirmities. Matters of recent occurrence which have not had opportunities for repetition, and so have not become organically registered and automatic, and which therefore involve consciousness, are far more dependent upon mind than matters of earlier date which have been so frequently repeated as to acquire automaticity. For this reason, patients suffering from general paralysis, while stating with accuracy events and detailed accounts of the past, can give but a very vague and confused history of the events of the past few days or weeks. This defect in memory is consequently one of the most noticeable symptoms in the early stage of the disease, and we notice it particularly in persons of methodical habits.

The diagnostic symptoms of general paralysis, aside from the exalted notions, are difficulty in articulation, with a trembling of the tongue when it is protruded beyond the teeth, often a turning of it to one side, and a general inability to use it freely, as if it were too large for the mouth, or too heavy for use, very flabby, and easily indented by the teeth; a peculiar dragging of one of the feet or legs; added to these symptoms will be found a heavy, dull expression of countenance, an unusual appearance of the eyes, and almost invariably an unequal contraction of the pupils. It requires close observation to detect these symptoms in the early stages, and careful treatment may relieve them temporarily; but although we may retard the issue of the disease by watchful care and skillful treatment, it inevitably advances insidiously to paralysis of the tongue and limbs, and enfeeblement of the mind.

The Treatment of Cough.

Dr. A. W. Perry says, on this subject, in the *Western Lancet*—

Opium preparations are the surest, but they frequently disturb the stomach and bowels, and produce other undesirable effects. I prefer cannabis indica alone, and opium and belladonna combined. In all cases of ordinary bronchitis of moderate intensity the disease tends to subside rapidly without medicine. Squills, ipecac., antimony usually always disturb the stomach, producing distaste for food, nausea or vomiting, with no good effect that I ever saw.

In the early cough of phthisis it is exceeding important to give nothing which will interfere with the digestive functions. On the contrary, every means should be used to preserve and increase the digestive power, and these two indications I have found best fulfilled by the use of cannabis indica in doses of one-fourth to one-third grain, as often as required, or by inhaling the warm vapor of a mixture of ext. of conium, ten grains to one ounce of water, several times daily, through a small inhaler.

In the compounding of cough medicines the form of administration is not indifferent. In most cases of cough the whole larynx is in a state of irritation and congestion, extending to the top surface of the epiglottis. Any cough medicine which is at all irritating provokes cough in simply passing over the epiglottis to the stomach. In using cannabis indica or larch resin, or other resins, in cough, the only liquid preparation is the tincture made with strong alcohol. I have found by experience that a syrup containing one-sixth or one-fourth of these tinctures would immediately cause a paroxysm of cough. By causing the resins cannabis indica or larch to be rubbed up with syrup and mucilage, the patient could take them without producing immediate cough. The immediate cough is due, therefore, solely to the irritating effect of the alcohol in the tinctures on the epiglottis. I often have patients tell me that taking whisky or brandy not much diluted makes them cough immediately; but when they dilute it a great deal and put in much sugar, it has no such immediate effect. This, then, teaches us that the menstruum in cough mixtures should be bland and soothing, and that we should not use tinctures. When syrups are disagreeable to the patient mucilage should be used as the vehicle.

We also see the explanation of the undoubted benefit of the homly tisanes of flaxseed, Iceland moss, etc.

The warmth of the liquid swallowed has also a very soothing effect on the upper part of the larynx. In regard to this point, a patient of mine lately told me that a very annoying spasmodic cough (due to commencing tuberculosis) had been more relieved by drinking hot water frequently than by anything he had used.

A single small pellet of tough mucus in the trachea or larger bronchi will often provoke a cough paroxysm of several minutes' duration, and when expelled the violent stretching and shaking of the bronchial tubes and air cells have left a congestion behind which tends to perpetuate the cough. It is in cases like these that narcotics act brilliantly. Where morphia is well borne, and not much contra-indicated, I get excellent results from the use of one-twelfth as much atropia as morphia in the mixture. The atropia diminishes the tendency of the morphia to constipate and make drowsy, and in phthisical cases it stops the night sweats frequently. In children under two years old the narcotics are frequently very dangerous, and when used should be given with great care and under frequent supervision by the physician. In young children who do not know how to cough well, a slight bronchitis may result fatally, from inability to get rid of the bronchial secretion. If ipecac., antimony, lobelia, squills, have any power to increase bronchial secretion, they increase this danger in young children. In young children, cough, unless very harrassing, should not be repressed by narcotics. Excessive and disproportionate cough often produces emphysema, and permanently damages the state of the lungs, leading

remotely to the worst consequences—vomiting of food, and thence failure in nutrition; loss of rest; hernia; great soreness of the muscles of the chest; and in old persons, with degenerated blood vessels, a rupture is frequently produced. If cough and expectoration both are great, but in proportion, diminish the expectoration by the administration of the oil of turpentine, copaiba, quinine, sulphate of zinc, larch resin; and then use narcotics if too frequent cough persists. Where the mucus is both abundant and tenacious, the use of chlorate of potass., in 5–10 grain doses, will liquify the expectoration, and thereby relieve a portion of the cough.

A New Method of Operating for Varicocele.

Isaiah H. White, M.D., of Richmond, Va., writes to the *Southern Clinic*—

H. W., of the United States Navy, sought relief because of pain along the spermatic cord, and softening and atrophy of the testicle, due to varicocele. The operation was as follows:—

The vas-deferens and spermatic artery being held aside, the scrotum is transfixed by a needle armed with a silk ligature, as in Ricord's operation, the one used in this case being a sewing-machine needle, which has the eye near the point. As the eye of the needle emerges through the counter-puncture in the scrotum, the loop of silk is caught, and through it passed a loop of catgut, which follows the needle during its withdrawal. One end of the gut is then drawn through and liberated from the loop of silk, leaving the catgut thus transfixing the scrotum behind the veins. The needle is again passed through the same puncture and counter-puncture in front of the veins, one end of the catgut caught in the loop of silk and drawn through as before. The veins are thus surrounded subcutaneously by a loop of the ligature, the free ends of which are left hanging out through the first puncture in the scrotum. The ligature is now tied, the ends cut short, and returned into the scrotum, and left to be absorbed. A similar ligature is then passed about an inch from the first.

At the end of three days the patient was walking about his room, the testicles being supported by a suspensory bandage. On the seventh day he returned to his ship, at which time everything seemed to be progressing favorably. If further experience should demonstrate the success of this method, much will be gained in the time spent in waiting for the detachment of ligatures in the other methods now in vogue, which not infrequently amounted to several weeks.

Absorption of Dialysed Iron.

The Boston *Medical and Surgical Journal* notes that M. A. Luton, of Paris, states that he has successfully introduced subcutaneously from five to twenty drops of solution of dialysed iron without causing the slightest local disturbance. The immediate effects of this appear to be a sensation of warmth, as often agreeable as otherwise, spreading over the whole person, a determination of blood to the countenance, an increased mental activity, etc. He calls this condition a sort of ferruginous intoxication (*ivresse ferrique*), of which the persistence is somewhat dependent upon the size of the dose injected. The appetite in these cases is diminished rather than improved, but instead of the constipation which usually follows the administration of iron by the mouth the bowels are pleasantly relaxed; also, the urine is deeper in color than that normally excreted, and yet its amount is not materially larger. He compares the effects of the hypodermic use of iron with that which follows the transfusion of blood, and states that they are similar. Finally, he says that any good pharmacist can prepare dialysed iron, and he is not interested in paying tribute to any special manufacturer.

Defects of Vision Produced by School Life.

The eminent oculist, Dr. R. Liebreich, has delivered recently two lectures on this subject.

School life is shown by him to produce the three following defects of vision:—

1. Decrease of range.
2. Decrease of acuteness.
3. Decrease of endurance.

In regard to the first of these, *myopia*, the author states that statistical inquiries prove that school life is (*par excellence*) the cause of short-sightedness, which is developed almost exclusively at this period.

Another important consideration is then brought forward, namely, that shortsightedness "has an injurious effect on the general health, by inducing a habit of stooping."

In regard to the second defect, decrease of acuteness, or *amblyopia*, it is pointed out that it is often produced at school "by unsuitable arrangements for work, which disturb the common action of the two eyes and weaken that eye which is excluded from use."

The third defect, *asthenopia*, decrease of endurance of vision, is stated to have two causes; one a congenital condition, *hypermetropia;* the second, a disturbance of the harmonious action of the muscles of the eye, generally produced by unsuitable arrangements for work.

Treatment of Diphtheria.

Dr. S. Oliver writes to the Edinburgh *Medical Journal*—

The following method of treating diphtheria I have, for a number of years, found to be so uniformly successful, in all cases in which I saw the patients before the disease had extended beyond the tonsils (or such parts as could be readily reached), that I do not hesitate to make it public through the medium of the Edinburgh *Medical Journal.*

The treatment consists in the free application to the patches of exudation, every three or four hours, of a mixture of one part of liquor sodæ chloratæ and three to six parts of water. When the proportion of the solution of chlorinated soda is too great, a suffocating feeling is produced, caused, I suppose, by spasm of the glottis. I give, internally, one grain of quinine and five grains of chlorate of potass. every four hours.

Reviews and Book Notices.

NOTES ON CURRENT MEDICAL LITERATURE.

——A small volume on the Surgery of Pericardial Effusion, by Dr. John B. Roberts, of the Philadelphia School of Anatomy, is soon to appear, from the publishing house of J. B. Lippincott & Co.

——Those interested in the advance of medical education will be gratified to read the report of the special committee on this subject, made to the Illinois State Medical Society, by the chair, Dr. E. Ingalls, of Chicago. It may be obtained from the author.

——The papers read at the "memorial hour," commemorative of the late Prof. Emeline H. Cleveland, M.D., of the Woman's Medical College of Pennsylvania, form a neat pamphlet of thirty-five pages, and are fitting tributes to this most estimable lady.

——Part VII of the "Atlas of Histology," by Dr. E. Klein and E. Noble Smith, F.R.C.S., continues the discussion of the minute anatomy of the nervous system, including the sympathetic ganglia, cerebro-spinal ganglion cells, and the peripheral distribution of nerves. Philadelphia, J. B. Lippincott & Co.

——Dr. Isaac Ott, well known for his careful physiological researches, gives, in a recent reprint, some new observations on the physiology of the spinal cord. His studies embrace the physiology of the secretory functions, the vaso-dilator centres, genito-urinary and rhythmical functions. From the *Journal of Physiology*.

——In a reprint by Dr. Walter Channing, of Boston, the writer expresses his opinion that insane criminals should be provided for in buildings erected exclusively for them, as soon as possible; and it is the object in his paper to show, first, why such separation is necessary, and second, how it may best be carried out.

——In a reprint from the St. Louis *Clinical Record*, Dr. W. A. Byrd, of Quincy, Ill., gives his experience in tracheotomy with the galvano-cautery. He states in its favor that it is, when properly performed, undoubtedly almost bloodless, as those who introduced it claim for it. It also leaves a gaping wound easy to introduce the tube through, and the divided surfaces present an eschar as a barrier to the absorption of septic matter, and as a preventive of the formation of membrane upon the wounded surface, in which it is superior to any other operation.

——Dr. David Cerna has made a series of observations on the toxical properties of phenol, or carbolic acid. His conclusions, and the experiments upon which they are based, are given in a reprint from the *Medical Times*. These conclusions briefly are—

I. The minimum fatal dose in the rabbit is fourteen and one-eighth minims of phenol per pound of the animal.

II. In the dog the minimum fatal dose is eight and four-sevenths minims of the poison per pound.

III. The soluble sulphates, acting in some manner as yet undetermined, form the most valuable antidotes to phenol thus far ascertained.

BOOK NOTICES.

Proceedings of the Oregon State Medical Society. 1879. pp. 91.

Transactions of the Medical Society of the State of North Carolina. 1879. pp. 120.

Transactions of the State Medical Society of Kansas. 1879. pp. 117.

The President of the Oregon Society, Dr. H. Carpenter, took the Society itself for his theme, and discussed its history and objects. Several analyses of local mineral waters are given by Dr. R. G. Rex. Some interesting suggestions on "psycho-therapeutics," or the mental cure of diseases, are made by Dr. E. P. Fraser, and on medical education, by Dr. C. H. Merrick. Cases of interest are reported by Drs. W. H. Saylor, J. R. Jessup, F. B. Eaton, and others.

"The conditions essential to the propagation and spread of infectious disease" is the subject of the address by Dr. Charles Duffy, President of the North Carolina Society. He includes these conditions under the four heads: 1st. Living germs; 2d. Susceptibility; 3d. Media of communication; and 4th. Outside or extraneous conditions. Eclampsia is the subject of papers by Drs. R. F. Lewis and W. C. McDuffie. Dr. W. W. Lane gives various instances of the relation between therapeutics and physiology. Dr. J. F. Long warns against the abuse of alcoholic medication. Sulphur in diphtheria is extolled by Dr. W. R. Wood, and various cases are reported by Drs. J. W. Faison, R. H. Lewis, T. D. Haigh, and others.

Dr. Furly, President of the Kansas Society, gave a historical address. Other papers in this volume are on treatment of fractures, by Dr. J. M. Carpenter; atelectasis, by Dr. C. P. Lee; puerperal convulsions, by Dr. G. W. Haldeman; chronic dislocation of the hip joint, by Dr. C. V. Mottram, and a number of reports of progress.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Half-Yearly Compendium of Med. Science,	2.50
Reporter and Compendium, - - -	7.00
Physician's Daily Pocket Record, - -	1.50
Reporter and Pocket Record, - - -	6.25
Reporter, Comp. and Pocket Record, - -	8.25

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,
115 South Seventh Street,
PHILADELPHIA, PA.

THE VARIETIES OF QUACK MEDICINES.

The advertising of secret nostrums is a constant source of complaint by the regular medical profession against the secular and religious press of this age. Our representations have indeed effected little or no good as yet, but for that very reason we should persist in them all the more.

We have a right to look more especially to the religious press of the country to set a proper example in this direction, but there we fail in nearly every instance. Very few indeed of the ordinary papers which take advertisements at all refuse those of vendors of quack medicines. Without directly challenging the sincerity of the editors and proprietors of these papers, we may charitably attribute their persistence in this course, which is so injurious to the public, to ignorance. They probably have not the thorough appreciation of the worthlessness of these articles and the unscrupulous character of these vendors which the intelligent physician soon acquires. It is well, therefore, to enlighten them whenever opportunity offers. A physician who sees in a respectably conducted paper such an advertisement should take note of the article and bring to the editor's notice any evidence as to its inertness, spuriousness, or dangerous character, which may come to his knowledge. If the editor is an honest man, of self-respect, he can hardly disregard a few such pieces of information.

The gross frauds constantly perpetrated on the public are well exemplified by a series of analyses revealing the formulæ of secret medicines, which have appeared in the *Chemist and Druggist* from time to time during the past year. Some of them are so bold as to be amusing, in their illustration of human credulity. One is a remedy for "lung disease," discovered by the wife of a clergyman. It was sold at a dollar a bottle; on examination it proved to be a clear, colorless, tasteless fluid; nothing else, in fact, than pure spring water!! Evidently the virtuous lady was a believer in the good old prescription: "spare diet and cool water clear." Another preparation, heralded as a certain relief in lung diseases, "when physicians are in vain," and sold at a dollar and a half a bottle, proves to be a coarse infusion of rhubarb and gentian in common cider. A powder for dyspepsia, sour stomach, etc., advertised among some herbal remedies as a strictly vegetable preparation, turns out to be simply ordinary bicarbonate of soda tinted with fuchsin. A cure-all, advertised as a "means of lengthening human life, and freeing and guarding it from diseases," sold at 75 cents a six-ounce bottle, was found to be sour, artificial cider, mixed with spirit, sugar, syrup of almonds and cherry juice. An infallible remedy in scrofula was a very weak solution of iodide of potash, colored and flavored.

But many of the nostrum makers are too smart to confine themselves to such simple preparations, which readily yield their ingredients to analysis, and prefer to mix up a variety of crude drugs, that will almost or quite defy the investigation of an expert. Thus a "balsam of life," proclaimed to be an infallible cure for almost all diseases, consists, approximately, of aloes, 10 parts; myrrh, 4; rhubarb, 2; gentian, 2; zedoary, 2; galangal, 2; larch agaric, 2;

saffron, 2; anise, 1; juniper berries, 1; theriaca, 5; sugar, 3. Made into a tincture with spirit 200 parts, and water, 100 parts. An "essence of life" includes rhubarb, gentian, and saffron, of each, 6; zedoary, agaric, myrrh, and theriaca, of each, 8; aloes, 32; French brandy, 860 parts. 50 grams, 1*s.* 3*d.* As theriaca alone has some sixty ingredients, the complexity of these mixtures is at once enough to condemn them.

Some of these advertisers succeed in another plan to deceive the simple, although the "game" is a very transparent one. They announce that they do not sell medicines, but will, on application, forward, for a small fee, or even gratis, a valuable recipe for some disease or other. The sufferer writes, and sure enough, receives by return mail a prescription, just like those his doctor is wont to scribble off. But when he takes it to his druggist an unexpected difficulty arises. Two or three of the ingredients are familiar enough, but one of them the druggist does not know, and after duly and vainly consulting the indispensable *Dispensatory*, has to confess his ignorance. The patient goes home and writes to the quack. The latter promptly answers, bewailing the ignorance of the local druggist, and offering to buy and send the missing ingredient on the receipt of a pretty round sum. He explains that it is dear and rare, but alas! is the very life and soul of the medicine. The dupe generally falls into the trap, and gets for a large price some worthless or common stuff. This is one of several ways of playing this game, but all are alike in results.

A step further in the direction of honesty is the compounder who obtains a prescription really serviceable in many cases, and boldly pushes it on the market by exaggerated but not wholly unfounded claims, throwing around it a halo of secrecy. The fortunes of Ayer, Jayne, Holloway, Schenck, Brandreth and others were made thus. Or a single preparation, perhaps an officinal one, is taken, for which much testimony is at hand, and special excellence in its manufacture is claimed, as Pond's extract of hamamelis, etc. Here the line shades off, and even the casuist hesitates as to whether he should condemn the advertisement as making false representations, or whether he ought not rather to praise the skilled manufacturer for energy and tact in surpassing others in his line. There is, indeed, a debated and debatable ground at this point; but as to the greater number of such cases, no one need be blind to their falsity, except those who do not wish to see.

Notes and Comments.

Therapeutical Notes.

SUCCUS LIMONIS IN TONSILLAR HYPERTROPHY.

Dr. De Saint Germain, of Paris, has found lemon juice a very simple and efficacious remedy for the suppression of hypertrophied tonsils. In young subjects he pencils the tonsils with lemon juice twice a day. A cure is usually obtained in two weeks. He does not consider more heroic treatment justifiable till this remedy has failed.

PROPHYLACTIC IN SCARLATINA.

Dr. L. C. Johnson, of India, writes to the Cincinnati *Lancet and Clinic*—

It is safe to say that belladonna as a prophylactic is a failure. In place of this I use carbolic acid, as follows:—

℞. Carbolic acid, 1 milliter.
Glycerine,
Aquæ cinnam., āā 1 decilliter.
Mix.

Sig.—One-half teaspoonful three times a day, when exposed, for a child three years old.

RECIPE FOR A SPICE BAG.

A writer in the *Medical Record* gives the following:—

Take a half-ounce each of cloves, allspice, cinnamon, and anise seeds, pounded, but not powdered, in a mortar; put these between two layers of coarse flannel, about six inches square, and quilt them in. Soak this for a few minutes in hot spirits (brandy, whisky, or alcohol) and water, equal parts, and apply it to the abdomen warm, renewing it when it gets cool. Its especial value is in infantile diarrhœa.

COMBINATION IN WHOOPING COUGH.

The editor of the *Western Lancet* says, in his September issue—

The following prescription has been employed with the most gratifying results, and is believed to be one of the best whooping cough mixtures. If faithfully administered, there will be a manifest improvement within a day or two:—

℞. Codeiæ, gr. j
Ext. grindeliæ rob, f. ʒ ij
Ext. œnotheræ biennis, f. ʒ j
Syr. glycyrrhizæ, ʒ ij.

For a child of two years a teaspoonful may be given after every paroxysm; younger children in proportion. If vomiting is required to expel the phlegm, syrup of ipecac may be given, when necessary.

The above prescription may be varied to meet the requirements of the case. The following may be found in the hands of other physicians as valuable as it has been in the writer's:—

℞.	Codeiæ,	gr. ss	
	Potas. bromidi,	℥j	
	Potas. iodidi,	ʒj	
	Chlorali hydratis,	ʒj	
	Syr. tolutani,	ʒij	
	Ext. glycyrrhizæ,	f. ʒss	
	Syr. ipecac,	ʒj.	M.

Sig.—¼ to 1 teaspoonful, in water, after each paroxysm.

Size of the Head in Various Occupations.

The *Medical Press and Circular* states that MM. Lacarsagne and Cliquet communicated to the *Société de Médecine Publique, etc.*, the results of comparative measurements of the heads of various individuals, viz., 190 doctors in medicine, 133 soldiers who had received a rudimentary education, and 90 other soldiers completely illiterate:

The antero-posterior diameter averaged:—

	Doctors.	Soldiers, Educated Partially.	Soldiers Illiterate.
	85.29	81.97	79.13
Frontal	48.91	43.65	42.35
Parietal	52.58	49.66	50.27

Moreover, the two halves of the cranium are not symmetrically developed. In the educated the left half is most developed, and in the uneducated the right half. They conclude:—

1st. The cranium is more developed in the educated than in the uneducated.

2d. In the educated the frontal region is relatively more developed than the occipital region.

Syphilitic Neuralgia.

It should be borne in mind that some cases of obstinate neuralgia are of syphilitic origin. Dr. Higgins recently reported one to the Toledo (Ohio) Medical Association. It was of a man suffering from pain in the right sciatic nerve, recurring periodically every day at the same hour. He treated it with quinine and anodynes for ten days, when he remembered that he had treated the same man some years previously for syphilis, the symptoms being hyperæsthesia of scalp, nocturnal pains and tibial node. The patient had had a sore twenty years before. There was no paralysis. He put him on the iodide of potassium, which relieved him within four days.

The Cinchona Cure for Drunkenness.

We duly noticed this vaunted cure on its announcement; we now chronicle its worthlessness. Dr. A. P. Hayne, Superintendent of the Home of the Inebriates, San Francisco, writes thus of it, after full trial, in the *Western Lancet*—

In no single instance have I found it to possess the slightest power in disgusting the patient with liquor or in any way diminishing his or her appetite or craving for intoxicating drinks. On the contrary, they have all freely confessed to me that the anticipation and the pleasure of a drink was as strong as ever. In no case have I seen whisky refused when offered, and in the majority it has been asked for. I know of an instance, in private practice, in which a person has stayed at home and taken the remedy all day, for several days in succession, and gone out in the evening only to be brought home thoroughly intoxicated.

Material for Splints.

Speaking of preparations which readily harden and are suitable for splints, Dr. Oscar H. Allis, of this city, in a late article in the *Medical Times*, observes that one of the most convenient is the white of eggs and flour. Take the whites of two eggs and beat into them flour until it forms a glutinous paste; this, when applied to muslin, will soon harden, and can be made of any desired firmness and strength by repeated layers.

Another, that may be kept on hand and ready for use is—

Gelatin (in small pieces),	7 ounces.
Water,	5 "

Dissolve with gentle heat, and add—

Alcohol,	4 ounces

This will dry in about two hours, and becomes stiff and tough.

Starch, glue, a solution of shellac in alcohol (often styled shellac varnish), plaster-of-Paris, silicate of soda, are or have been employed for this purpose.

Finger Blistering for Neuralgia.

Dr. Walke gives, in the *Southern Clinic*, this recipe—

℞.	Chloroform,	
	Bay rum,	āā equal parts.

Sig.—Shake well before using.

He says of it:—

My attention was called to this as a remedy for neuralgia of the scalp some ten years ago. I have frequently used it since, and I have known it to be used by others. By applying it to the temple or seat of pain, with the end of the finger,

holding the finger to the parts to exclude the air and prevent evaporation, in two or three minutes it so reddens the skin, and the pain from it is so severe, I have had to remove it to prevent its blistering. A blister can be formed, I am satisfied, in five or ten minutes. I knew a friend who applied it upon a handkerchief to his temple, while suffering with neuralgia, and becoming eased, fell asleep without removing it, though it caused a severe and troublesome blister.

Napheys' Therapeutics in England.

It is gratifying to find the steadily growing appreciation of this work by the profession in Great Britain. A large number of copies have been ordered for the London market, and the critics of the medical press have expressed themselves in warm terms of the value of the book. The *Lancet* remarks, "To collect such information with judgment and with completeness is a very great service to the practitioner, who in the emergencies of practice often wants to see at a glance the best plans of treatment and the best remedies. The fault of such books is that the selection of remedies is often made very fancifully, according to the author's own predilections; but in the present instance the selections are made with judgment, and are fairly complete." The *Medical Press and Circular*, Dublin and London, says: "No one who carefully peruses this work can feel surprised at the demand for it. It contains nearly all the recent additions to therapeutical knowledge, arranged in an orderly manner, so that the busy practitioner can lay his hand at once upon what he wants. It should have an extensive sale among those practitioners who are anxious to be abreast of the times."

We have permitted ourselves these quotations from such eminent foreign authorities, as a sufficient reply to the animadversions which the popularity of the book has elicited in some quarters in this country.

Vitality of the Teeth.

In the *Dental Register*, September, 1879, Dr. Rawls states that he heard Dr. Geo. Watt report the case of a boy having a tooth knocked out while coasting; the tooth was lost in the snow for some time, and when found was completely frozen; the Doctor, after thawing it successfully in cold, tepid and warm water, replanted, and since then, to all the known tests, it has responded as a living tooth. Dr. Rawls once had a case similar to that of Dr. Edwards. In extracting a decayed, second lower bicuspid, which impinged on the first bicuspid, the latter popped out, clear across the room; he replaced it, saw the patient six months afterward, and the tooth responded to every test.

Correspondence.

The Doctor His Own Druggist.

Ed. Med. and Surg. Reporter:—

I have not seen the previous communications on this subject, but Dr. Johnson's, in the last number of your journal, raises the question, Is it professional for a physician to dispense his own medicines when the services of a druggist can be conveniently obtained? Another question might be asked: Is it desirable that he should do it?

The first may be answered briefly, and I believe correctly, as follows: If the physician can cure his patient more quickly, safely and pleasantly by dispensing, than by prescribing, it is certainly his duty to do so; I conceive that under these circumstances it is perfectly professional. It would certainly appear that the physician should regard, *ceteris paribus*, the interests of the patient before those of the apothecary. The relation between patient and physician is a confidential one, and it certainly should be a point of honor with the latter to do his best, and not content himself simply with the "ordinary diligence" that the law requires. First, as to curing quickly. If the physician selects the appropriate remedy, the better the quality of the drug the quicker the cure, other things equal. As the physician can, if he chooses, dispense only the best attainable qualities, he will probably do better for his patient than if he prescribes, because in the majority of instances the patient will not obtain the best attainable quality from the druggist. On the other hand, if the doctor contents himself with dispensing the same inferior qualities that the druggist supplies, the patient is in no wise the gainer, so far as his health is concerned, and the doctor had better leave the matter alone.

Second, as to safety: It has been asserted that if physicians undertake to dispense they will be more likely to make mistakes than the druggist, partly on account of lack of familiarity with pharmaceutical operations, and partly because their minds are occupied with other matters, *e. g.* symptoms of patient, or disturbed by his presence during the operation of dispensing, while the druggist's mind is occupied solely by the work before him, namely, the compounding of the prescription. These are, doubtless, strong *primâ facie* arguments, but when properly looked at lose, I think, some of their force. The *tendency* in medicine is, and has been for the last two hundred years, from poly-pharmacy toward mono-pharmacy. In earlier times prescriptions containing twenty-five, fifty, and even more, ingredients were not uncommon. Now-a-days we seldom see more than three or four. Some physicians follow with almost religious strictness the classic formula of *agens, adjuvans, corrigens* and *menstruum*. Now this appears to me to be, in many instances, an unnecessary complication. If

the *agens* is not sufficiently active, give a larger dose of it and dispense with the *adjuvans*. If, on the other hand, it is too active, give less of it, and thus dispose of the *corrigens*.

The *menstruum* should be as simple as possible, and in most instances I believe that water is the most desirable one.

Let us see how this may be applied to active medicines in common use, such as tinct. or fluid extract of aconite, belladonna, nux vomica, and a dozen others that will immediately suggest themselves. If the physician hands the patient a vial of either of these, and supplies him, or tells him where he can procure, a minim dropper, and directs him to take a certain number of drops in a spoonful or wineglass of water, he will, I think, be able to get as good therapeutic results as if he writes—

℞. Tinct. nucis vomicæ ...
Syr. cort. aurant., ...
Aquæ, āā ... M.

Sig.—Teaspoonful ... times a day.

Not long since I saw something like the following, written at a dispensary:—

℞. Tinct. nucis vomicæ, ℥ j
Potassii bromidi, ʒ vj
Syrupi simp.,
Aquæ, āā ℥ ijss.

℥ j t. i. d., before meals.

On asking the doctor the purport of the mixture, he kindly explained that the man had a weak stomach, that needed toning up with nux vomica, and as his stomach was very weak a large dose was necessary. He had before this, he said, given him nux vomica plain, but the patient complained that it made him nervous and fidgety, and that it was too bitter, and he didn't like it. So the doctor very scientifically (?) added the bromide to calm the nerves, and the syrup to sweeten it a little. It did not occur to him that a smaller quantity of the drug would have diminished the bitterness and would not have disturbed the nervous system so much.

Now, if a physician finds it necessary to use the mixtures we have indicated, or similar ones, he should by all means write prescriptions and let the druggist attend to the dispensing, because in cases of this sort it may, perhaps, be safer to leave the compounding to one who is experienced and skillful in pharmaceutical manipulations. Further, the druggist will be likely to furnish the mixture in a neater and more attractive form, which is a matter of some practical importance.

If, on the other hand, the physician thinks he can get along with the nux vomica, or what not, *plain*, let him by all means dispense it himself. If his stock bottles are properly arranged and carefully labeled, I think he can with confidence attack the difficult pharmaceutical problem of pouring from a large bottle into a small one. Physicians in this country, who live away from cities and large towns, have from the earliest times been in the habit of dispensing their own medicines. They doubtless sometimes make mistakes, but so do druggists, and I am inclined to believe that a larger number of fatal casualties have occurred through errors in dispensing at the hands of druggists than of physicians. There is nothing, therefore, to be apprehended on the score of safety. The level-headed physician will make no more mistakes in dispensing than in prescribing; while if he is not a careful, well educated and judicious man, it matters little which he does; his patients will probably fertilize the soil sooner than if they were left alone.

If the truth of the propositions here stated be denied, I hope I may have an opportunity of meeting such objections as may be raised. On the other hand, if they are granted, I should like to discuss some other aspects of the question, and more particularly the financial one; and also to consider the relations, as regards comity, that should exist between physician and apothecary.

New York City. H. G. P.

Hypodermic Use of Morphia.

Ed. Med. and Surg. Reporter:—

The request of Dr. Kane, of New York, to answer certain questions in regard to the hypodermic injection of morphia, prompts me to give some of my experience in that direction in the past eight years. I do so the more readily because there seems to be a strong prejudice in the minds of some of the older country practitioners, against the hypodermic use of morphia. I was in consultation, not long since, with a very intelligent physician of great standing, and an army surgeon of the late war, who said he had never used the hypodermic syringe, and did not intend doing so, as he considered it dangerous and uncalled for. I am acquainted with a number of other regular physicians, who, either from want of appreciation of its great value, or thorough prejudice against it, do not own hypodermic syringes, and consequently never make use of it.

I was called upon a few years ago to take charge of a case of very acute uterine pains, in connection with great irritability of the stomach, which the attendant had utterly failed to relieve after two days' trial, because she could not retain his powders on her stomach. I relieved her with two fourth-grain injections of sulph. morphia.

Now, it must be admitted that the hypodermic use of morphia is a matter not to be trifled with by any one, or tampered with by persons unacquainted with its proper use. But neither ought poisonous medicine, like arsenic, strychnia, etc., be carelessly or ignorantly used; and yet no one would think of discarding these valuable remedies because they require care in their administration. That it is one of our most potent means for the relief of human suffering, no one doubts who has had any experience in its use. In acute pains, of a spasmodic nature, is where its great value is most apparent; and, in fact, in many cases its use is almost indispensable.

In illustration of its great utility and its superiority over giving by mouth in particular cases, I will cite the history of a case of severe cramp of the stomach in a young lady I was called upon to treat about six months ago. There was nothing peculiar about the case, excepting the spasmodic closure of the cardiac orifice of the

stomach, preventing the entrance of any substance whatever into that organ. I received the call on my way to another patient, and unfortunately did not have with me my hypodermic syringe; I gave her at once, by mouth, sulph. morphia, half a grain, to be repeated every hour until pain is relieved. I also ordered a large mustard plaster over the gastric region, to be followed by hot stupes. Four hours after my first visit I was sent for again. I found the pain no better, though she had already taken two grains of morphia. I now injected, within three-fourths of an hour of each other, two fourth-grain doses of morphia, which relieved her entirely in twenty minutes after the last dose. I felt some anxiety after she was relieved as to the effects of the morphia taken by mouth when the stomach would become relaxed, but she recovered without much trouble.

Take as another instance, illustrative of its indispensable value, a severe case of cholera morbus, with excessive vomiting, in which nothing will be retained in the stomach sufficiently long to produce relief; a hypodermic injection of a third or a fourth of a grain of morphia will almost invariably relieve your patient in less time than it takes to send a prescription to the nearest apothecary. There are many other instances in which if the hypodermic syringe is not used the attendant does not do his full duty, up to the latest advances in medical science. I have frequently entirely relieved the urgent distress and suffering of cases of cholera morbus and colic in from ten to fifteen minutes, a result that cannot be accomplished in any other way. Of all the means at our disposal for the combating of disease and suffering, I know of none in which I have such implicit confidence, as in the hypodermic syringe. When called to a case of acute pain, I feel certain I can relieve it, no matter whether my patient can retain anything in his stomach or not; and besides that I always know just how much morphia is in my patient's system, which is not always the case in giving by mouth. The evil results sometimes accompanying and following the hypodermic use of morphia can generally be avoided by care in performing the operation. The solution should be thorough and clear of extraneous matter, and I always heat it to about the temperature of the body before injecting. The greatest danger is in injecting into a vein sufficiently large to carry the whole dose at once into the circulation. That can be avoided by selecting a place where the large veins are least numerous, and by injecting, say a third of the dose and then waiting eight or ten seconds, when, if in a vein, the symptoms will show themselves. The first symptoms are a feeling of great fullness of the head and intense flushing of the face; coming on within a few seconds after the operation. Such, at least, was the case in a patient of mine.

Care should also be taken to introduce the point of the needle well into the subcutaneous cellular tissue, and not inject into the substance of the skin, otherwise the skin at once swells, as if stung by a bee, and abscesses are liable to follow. To do this properly the skin should be raised by pinching a fold of it between the thumb and finger and entering the needle perpendicularly to its surface, and not, as I have seen it done, at but a slight angle to the surface, passing through the skin for half an inch or more before entering the cellular tissue, causing considerable pain. I saw several abscesses follow its use, but in every instance I am satisfied the point of the needle had not been clearly in the subcutaneous cellular tissue. My usual dose is a fourth of a grain; less if the pain is slight, and more if extraordinarily severe; I have already given as much as three grains in a case of severe cramps in a person addicted to the excessive habitual use of opium.

I usually give morphia sulph. alone, excepting in neuralgic affections, when I combine a fourth grain morphia to a sixteenth of a grain of sulph. atropia. I do not submit this to your readers as embodying anything new or original, but merely as a gentle reminder to the inexperienced in this matter, of some interesting facts connected with its practical use.

J. A. Houtz.

Logansville, Clinton Co., Pa., Oct., 10th, 1879.

Singular Form of Malarial Poisoning.

Ed. Med. and Surg. Reporter:—

This case being a little singular, is my apology for reporting it. At 4 P.M. on the 16th of August, 1878, I was summoned to see Jacob K., a farmer, aged 50 years, living about three miles from town. I was told by the messenger that he was "jerking all over, and wanted me to bring my lancet along." I armed myself with the instrument and hastened to his assistance. When I arrived there I found him on the floor and apparently in the worst stage of chorea. By inquiry I learned that he had had a chill of ague in the forenoon of the same day, and instead of it being followed by fever, as is usually the case, he was seized with irregular contractions of nearly all the voluntary muscles, simulating chorea It was so violent from the time of its commencement, which was 12 M., that he was nearly exhausted when I first saw him. He said that about 23 years since he had a chill and it was followed by the same symptoms. At that time they bled him freely, which gave instant relief and he requested me to do the same; but thinking it best not to resort to venesection, I gave him, as near I could guess—not having anything with me to weigh it—20 grains of bromide potass. combined with 3 grains pulv. opii; thirty minutes after the medicine was given he fell asleep, and the irregular muscular contractions ceased. I remained with him another half hour, and he was still sleeping, seemingly natural. I told his wife to let me hear from him in the morning, which was done by himself coming to town; he said that he slept about five hours after I gave him the medicine yesterday, and awoke very much refreshed. His tongue at this time was heavily coated, and he complained of his limbs, back and head aching; he had all the symptoms of intermittent fever, for which I treated him. He then remained as well as usual until the 19th of September, in the same year, when I was called to visit him again, which I did, and found him in the same condition as in August, lying on the floor, with the irregular muscular contractions. I gave him the bromide and

opium, which soon quieted the muscles and gave him another good sleep; I then followed the same treatment as before. Since that time he has been in good health, has had a few symptoms of ague occasionally, but always avoided a chill by proper remedies. M. O. LOWER, M.D.

Liberty Mills, Ind.

Effect of Molasses on the Health.

ED. MED. AND SURG. REPORTER:—

In the REPORTER of August 16th I see an extract taken from a communication by Dr. J. H. Miller, of South Carolina, to the Louisville *Medical News*, in which he says that the use of "home-made molasses" is a cause, or will produce the excitant cause, of the "bilious fever" of the South. This may be so in South Carolina, but is not the case in Mississippi. Here, when the season for making molasses comes, those engaged in making it use the juice in all the stages, from the crude material as it leaves the mill until it becomes molasses, without any apparent trouble, and fatten all the time. I live and practice among people that use a considerable quantity, but have never seen a case of intestinal worms that I thought was due to its use. I think if the Doctor will observe more closely, he will find the cause of his trouble in the general hygienic condition of his patients.

Lake, Miss. A. MCCALLUM, JR., M.D.

NEWS AND MISCELLANY.

Official List of Changes of Stations and Duties of Medical Officers of the United States Marine Hospital Service, July 30th to September 30th, 1879.

Ellinwood, C. N., Surgeon. Granted leave of absence for thirty days, from August 12th, 1879. August 5th, 1879. Ordered to rejoin his station. September 10th, 1879.

Bailhache, P. H., Surgeon. Relieved from duty at the Port of Baltimore, and ordered to New York to relieve Surgeon Ellinwood, granted leave of absence. August 6th 1879. Detailed as Chairman Board of Survey to examine damaged property at the New York Marine Hospital. September 23d, 1879.

Doering, E. J., Surgeon. Detailed as Chairman Medical Board of Survey to examine into the physical condition of an officer of the Revenue Marine Service. September 22d, 1879.

Gassaway, J. M., Assistant Surgeon. Detailed as member of a Board to report upon the advisability of establishing a marine hospital at Port Townsend, Washington Territory. September 18th, 1879.

Fisher, J. C., Assistant Surgeon. Relieved from duty at Cairo, Ill., upon the arrival of Assistant Surgeon Carter, and ordered to report for duty to the Surgeon General M. H. S. August 25th, 1879.

Brown, F. H., Assistant Surgeon. Granted leave of absence for fifteen days from July 12th, 1879. July 7th, 1879.

Goldsborough, C. B., Assistant Surgeon. Assigned to temporary duty in charge of the service at the port of Baltimore, Md. August 6th, 1879.

Granted leave of absence for twenty days from September 22d, 1879, by reason of physical disability. September 19th, 1879.

Irwin, Fairfax, Assistant Snrgeon. Granted leave of absence for thirty days from October 7th, 1879. September 18th, 1879.

Glazier, W. C. W., Assistant Surgeon. To proceed to Georgetown, S. C., as inspector. July 17th, 1879.

Dana, C. L., Assistant Surgeon. Detailed as member Board of Survey to examine damaged property at the New York Marine Hospital. September 23d, 1879.

Carter, H. R., Assistant Surgeon. Relieved from temporary duty at the port of Boston, Mass., and ordered to proceed to Cairo, Ill., and assume charge of the service, relieving Assistant Surgeon Fisher. August 25th, 1879.

Heath, W. H., Assistant Surgeon. To proceed to New York for temporary duty. July 15th, 1879. Relieved from duty port of Georgetown, D. C., and ordered to report to Surgeon Ellinwood, port of New York, July 26th, 1879. Detailed as Recorder Board of Survey to examine damaged property at the New York Marine Hospital. September 23d, 1879.

The following candidates having passed the required examination were appointed Assistant Surgeons, July 21st, 1879:—

O'Connor, Francis J., of the District of Columbia, (assigned to temporary duty, port of Georgetown, D. C., July 26th, 1879. Ordered to Baltimore, Md., for temporary duty, during the absence of Assistant Surgeon Goldsborough. September 20th, 1879.) and

Porter, Frederick D., of Michigan. (Assigned to temporary duty at the port of Detroit Mich., July 25th, 1879. Granted leave of absence for fifteen days from September 6th, 1879. September 1st, 1879.)

"St. Virchow's Well."

That the great pathologist and opponent of dogmatic belief should himself become a miracle worker is a funny satire. Yet such is the fact. When he went, last spring, to look at Dr. Schliemann's diggings at old Troy, the rumor soon spread that he was a renowned healer of disease. Consequently, sick and infirm people flocked in daily increasing numbers to Hissarlik, from far and wide. There are no roads and no vehicles. So the people came on foot, or on horseback, or riding on asses; even women coming thus from a long distance. Very infirm people were brought in great baskets slung across a horse's back, sometimes one on each side, by way of balanee. The patients used to range themselves in a long row, opposite the wooden hut in which Virchow lodged, each waiting patiently until his or her turn came.

But the joke remains to be told. While there Virchow had a well dug in the old bed of a stream, now dry, to obtain good water. Since he left, Dr. Schliemann writes that the inhabitants "regard the excavation and spring with veneration, and have fenced it around with stones.

The spring is called 'the doctor's well,' and magical virtue is ascribed to it. Every one comes to draw water from it."

Planetary Influences.

Dr. E. M. Snow, of Providence, remarks, in his last monthly report as Health Officer of that city—

We have had occasion recently to know that some very intelligent persons have been fretting and troubling themselves about certain sensational newspaper articles, describing some conjunction of the planets, which, it is said, is to bring disease as well as other calamities, during the present year, upon the human race.

The time is forever past when any one can accuse the "Providence of God," or any occult influence of the planets, for the death of their children, from either diphtheria, typhoid fever or scarlatina.

The study of astronomy is very interesting and profitable, but those who are really desirous of finding the causes of diseases need never look beyond the planet upon which they live, and to find the causes of diphtheria, typhoid fever and scarlatina, they need not, *generally*, look beyond their own houses and yards, or the yards of their immediate neighbors.

Syphilis in Japan.

Previous to 1869 the percentage of cases admitted to hospital for syphilis, in Yokohama, was 24.4; in that year legal preventive measures were enforced, and since then the admissions have been reduced to about 11 per cent. The Japs approve of preventing this disease by legal sanitary measures; so do the French, English and Germans. The Utah Indians, Hottentots and citizens of the United States do not; they think it would interfere with the liberty of the individual, or else would be immoral.

Personal.

—By direction of the Secretary of War, Surgeon Charles Sutherland is ordered to report in person to the Commanding General of the Military Division of the Pacific, for duty as medical director of that division. Surgeons B. J. D. Irwin and W. D. Wolverton are ordered to report to the headquarters of the department of Dakota, for assignment to duty.

Items.

—*Correction.*—In Dr. Morgan's article, the first ℞, on p. 291, should read extr. belladonna ʒ ij; and the * refers to the strychnia solution.

—A pennyroyal factory at Walnut Hill, Ill., has utilized 167 tons of the herb this year.

—A Michigan chiropodist offers to chirop with any man for $100 a side. If beaten he will acknowledge the corn.

—A visitor to Hempstead Church (England), where the celebrated Harvey lies buried, found his tomb decaying, and writes that his family is extinct in the male line, as is usual with great men.

—Mr. George Arthur Gardiner, nephew by marriage of Prescott, the historian, died in Brooklyn on the 27th ult., in great agony, after two weeks of indescribable suffering. It is said by his attending physician that his death was caused by arsenical poison placed by a dentist in one of his teeth, for the purpose of killing an aching nerve.

OBITUARY NOTICE.

The Rev. G. B. Perry, M.D., D.D., LL.D., died at Hopkinsville, Ky., September 30th, 1879, in his 79th year. He received the degree of M.D. from the Jefferson Medical College at an early day, and practiced some years before entering the Protestant Episcopal ministry. He was a near relative of Commodore Perry, hero of the battle of Lake Erie, and was born under the same roof.

MARRIAGES.

FAIRBAIRN—SACKET.—On Wednesday, September 24th, at Cape Vincent, N. Y., by the Right Rev. F. D. Huntington, D.D., assisted by the Rev. G. G. Perrine, Archibald C. Fairbairn, M.D., of Minneapolis, Minn., and Fanny E., daughter of Gen. D. B. Sacket, U. S. Army.

GUTHRIE—WRIGHT.—In the First Presbyterian church of Wilkesbarre, Pa., September 24th, by Rev. F. B. Hodge, George W. Guthrie, M.D., and Sarah H. Wright, both of Wilkesbarre, Pa.

HAWLEY—MARTIN.—On Thursday, September 18th, 1879, at the residence of the bride's parents, by Rev. W. Hollingshead, Dr. H. W. Hawley, of Scottsville, N. Y., and Miss Mary Martin, of Cincinnati.

HAYNES—REA.—By Rev. A. G. Eagleson, September 17th, 1879, at the home of the bride's father, in Washington, Guernsey County, Ohio, Mr. Horace C. Haynes, of Cambridge, Ohio, and Miss Mary F., daughter of Dr. F. Rea.

SHERMAN—CUNNINGHAM.—Wednesday, September 24th, 1879, at the residence of the bride's parents, Mt. Vernon, N. Y., by the Rev. M. H. Hutton, D.D., Dr. James T. Sherman, of Boston, Mass., and Miss Belle G. Cunningham.

TUCKER—NEWMAN.—In the Second Presbyterian church, Albany, N. Y., September 17th, by Rev. A. J. Upson, D.D., assisted by Rev. E. Halley, D.D., Willis G. Tucker, M.D., and Mary, daughter of Charles Newman, all of Albany.

WADE—WHIPPLE.—At the Church of the Transfiguration, West Philadelphia, by the rector, Rev. Thomas K. Conrad, D.D., S. Herbert Wade, M.D., and Clara Moreland, eldest daughter of the late Captain William P. Whipple, all of this city.

DEATHS.

BADGER.—At her residence, at Flushing, Long Island, on Wednesday, October 1st, Mary Emily, wife of Dr. William Badger, and daughter of the late Rev. A. H. Crosby.

SANDS.—At Haydenville, Mass., on Saturday, September 20th, Alice Hayden, wife of Dr. Henry B. Sands, and daughter of Peter Hayden.

SHEW.—Mrs. Clara Bradley Shew, the wife of Dr. A. Marvin Shew, Superintendent of the Hospital for the Insane, at Middletown, Conn., of diphtheria, after a short but severe sickness, on Monday morning, September 22d, 1879, at her home in Middletown.

YARD.—In Trenton, N. J., on the 26th ult., Thomas S. Yard, M.D., son of the late Capt. Joseph A. Yard, aged 42 years.

HORSFORD'S
Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory orgaus, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges

MANUFACTURED BY THE

RUMFORD CHEMICAL WORKS,

1155-1206 PROVIDENCE, R. I.

DE **DUDLEY'S EMULSION** DE

OF PURE

NORWEGIAN COD LIVER OIL

PANCREATINE

AND

DE **LACTO-PHOSPHATE OF LIME** DE

FORMULA.—Each fl. oz. contains six grs. of Pancreatine, sixteen grs. of Lacto-Phosphate of Lime, twenty-five per cent. of Glycerine, and **fifty** per cent. of Norwegian Cod-liver Oil.

THE ONLY PANCREATIC EMULSION MADE IN THE UNITED STATES.

This preparation is respectfully submitted to physicians as being **always** reliable. Although well aware that Cod-liver Oil Emulsions have fallen into deserved disrepute, yet we are confident this will stand any test or trial it may be subjected to. It contains no GUM ARABIC, TRAGACANTH, ALBUMEN, SACCHARINE OR ALKALINE MATTER; therefore, it will not SAPONIFY, FERMENT nor RANCIDIFY. The addition of **Pancreatine** insures rapid and complete assimilation, enabling patients with very weak stomachs to easily retain and digest it.

Guaranteed to keep in any climate. Physicians supplied with samples (express paid) on application.

DUDLEY & CO., Pharmaceutical Chemists,

Laboratory, 397 and 399 Pearl Street. **423 Fulton Street, Brooklyn, N. Y.**

MESSRS. DUDLEY & CO.: *Dear Sirs*—Though your EMULSION has not been before the profession a long time still I have used it quite extensively in my practice, and can truly say I think it one of the most elegant preparations of Cod-liver Oil I have ever prescribed. I find it can be readily taken and borne by the most delicate stomach, and the PANCREATINE and PHOSPHATES make its administration desirable in a large number of cases other than phthisical. In fact, there are few cases of mal-assimilation and general debility in which its administration will not do good; and it gives me pleasure to recommend it to my professional brethren.

179- HOMER L. BARTLETT, M.D., Brooklyn, N. Y., Consulting Surgeon Kings County Hospital.

NEW REMEDIES.

FLUID EXTRACTS.

Coto Bark.—From BOLIVIA. Almost a specific in acute and chronic diarrhœa, cholera, cholera morbus, etc.

Cascara Sagrada.—(**Rhamnus Purshiana.**) From the PACIFIC SLOPE. A certain remedy for habitual constipation; and very useful in all cases where a laxative or cathartic is indicated. Beware of the fluid extracts of spurious varieties of this bark.

Folia Carobæ.—From BRAZIL. A powerful alterative, which exerts a marked curative action in syphilis, scrofula and kindred disorders.

Rhus Aromatica.—A remedy in diabetes, and other diseases of the genito-urinary organs.

Damiana.—(**Turnera Aphrodisiaca.**) From MEXICO. The best known aphrodisiac. Of great value in impotence, spermatorrhœa, and loss of sexual appetite.

Boldo.—(**Peumus Boldo.**) From CHILI. The new tonic. Very useful in dyspepsia, hepatic torpor, yellow fever, etc.

Berberis Aquifolium.—From CALIFORNIA. Has marked alterative and tonic powers, and has been used with extraordinary success in salt rheum, psoriasis, eczema, scrofula and syphilis.

Black Haw.—(**Viburnum Prunifolium.**) From the UNITED STATES. Employed to prevent abortion and miscarriage.

Grindelia Robusta.—From CALIFORNIA. A valuable curative agent in asthma and diseases of the air passages.

Grindelia Squarrosa.—From CALIFORNIA. Anti-malarial. Used in enlarged spleen and other malarial diseases.

Cereus Bonplandii.—(**Cereus Grandiflorus and Cereus McDonaldii.**) From MEXICO. Heart sedatives. Very useful in controlling functional and organic disturbances of the heart.

Kaki.—(**Diospyros Kaki.**) From JAPAN. Peculiar action on the mucous surfaces. Useful in mucous dyspepsia, typhoid fever, etc.

Cercis Canadensis.—Indigenous. A positive remedy in chronic diarrhœa, dysentery, etc.

Jaborandi (diaphoretic). **Guarana** (sick headache). **Fucus Vesiculosus** (anti-fat).
Bearsfoot (enlarged spleen). **Coca** (nervous stimulant). **Kava Kava** (Gonorrhœa).
Eucalyptus Globulus (antiseptic and anti-malarial). **Yerba Santa** (coughs).
Yerba Reuma (catarrh). **Wood Betony** (dyspepsia). **Ustilago Maidis** (oxytocic).
Penthorum Sedoides (catarrh). **Soap Tree Bark** (tooth wash).

CRUDE DRUGS.

Goa Powder (ringworm and diseases of the skin). **Gurjun Balsam** (a substitute for Copaiba).
Alstonia Constricta (a substitute for Calisaya).

SUGAR-COATED GRANULES.

Calcium Sulphide 1-10 gr. (for the cure of boils and carbuncles).

Our limited space prevents our describing in detail the history and application of each remedy, but to those interested in NEW REMEDIES, we will say, that we can furnish interesting information relative to the above new drugs.

PARKE, DAVIS & CO.,

DETROIT, - MICHIGAN.

Our New Remedies can be procured of the Drug Trade throughout the United States. By specifying "**P., D. & Co.'s**" in all cases, you will ensure reliable preparations of the **true drugs.**

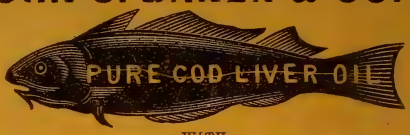
SOLUBLE
Pills and Granules.
UNEQUALED FOR
Purity in Composition, Solubility in Coating, Uniformity in Size, Perfection in Form and Finish.

1. The best materials are used in their manufacture.
2. No article required by a formula is omitted on account of its high cost.
3. No Pills are deficient in weight.
4. The Pills are Coated while soft.
5. There is but one Coating, which is perfectly soluble, and there is no sub-coating of resinous character.
6. The Coating is so transparent as to clearly reveal the color of the mass, and its solubility is not impaired by age.

Our list of Pills and Granules embraces those made according to the formulæ of the U. S. Pharmacopœia; also most of those in common use among the profession.

Trade supplied in Philadelphia by
1164-12 5eow ROBERT SHOEMAKER & CO.

JOHN C. BAKER & CO.'S



WITH
EXTRACT of MALT,

A combination we have lately added to our list, in response to a demand from physicians of this city, who have used our **Pure Cod Liver Oil** and other preparations. The praise accorded by all who have used it induces us to seek a wider market by calling general attention to it.

A Trial is Respectfully Solicited.

Our facilities for the manufacture of
THE EXTRACT OF MALT
are unsurpassed, and perfect reliance may be placed on the article bearing our label.

Above are in full pint bottles, and with our other specialties:—
Baker's Pure Cod Liver Oil,
" *C. L. O., with Phosphate of Lime,*
" " " *and Wild Cherry,*
" " " *Hypophosphites of Lime and Soda,*
" " *and Malt with Syr. Iod. Iron,*
Are supplied by the drug trade generally.

An astringent and balsam combined, in most convenient form for application. Rapidly becoming popular with physicians. Descriptive circular and endorsements mailed on request. Boxes of 14 suppositories to physicians, 75 cts., by mail.

Lecture.

ON DISEASES OF WOMEN.

Delivered at the College of Physicians and Surgeons, New York,

BY PROF. T. GAILLARD THOMAS, M.D.

REPORTED FOR THE MED. AND SURG. REPORTER.

The Study of Gynæcology at this Clinic.

Gentlemen:—It gives me great pleasure to welcome back those of you who have been accustomed to meet with us here, and to offer a hearty greeting to such as now come among us for the first time. I shall endeavor, in the first place, to set before you briefly, as is my usual custom on such occasions as this, the methods of study which I believe to be the most advantageous and which we are going to follow here. When I first commenced to give clinical lectures on diseases of women, I tried a plan which all young clinical teachers in this branch adopt for a time. I never knew one, however, who did not eventually give it up. The practice to which I refer is the attempted exhibition to the class of various uterine troubles by means of the speculum; and I do not hesitate to declare to you that under such circumstances it is a farce, an impossibility, and often a fraud.

Let me explain to you why this is so. Suppose, for instance, I should have a patient with laceration of the cervix uteri, which I should like to exhibit to you. At the distance of six inches from the speculum one might see very well, and at the distance of a foot, perhaps, get a moderately good view; but a person sitting as far away as even the first row of benches could see absolutely nothing of the condition existing. Unfortunately you would see less than nothing; for you would get the most erroneous idea of the very part which I attempted to exhibit to you. If I were to bring my cases before a class of only five or six, of course, it would be a different matter; but in such a clinic as this the actual inspection of uterine disease (except in very rare cases) is manifestly impracticable. In the first place, if I were to allow you to come down individually into the amphitheatre, our time would be completely wasted; for in order to really see anything it would be necessary for each of you to occupy two or three minutes. Otherwise, you might be altogether misled in regard to the cases.

I therefore gave the plan up, as I said, not in order to save trouble, as one might perhaps suppose, but because I found that it was really of no service whatever.

Another point upon which I lay great stress (and this is one upon which you will hear me insist over and over again) is this, that the speculum is in reality the least valuable of all the means at our disposal for diagnosis in gynæcological practice. You must learn to see through the ends of your fingers, and in nine cases out of ten you will get more information by means of a cultivated touch than could be elicited through the agency of any speculum whatever. Place your reliance, therefore, on your fingers, and not on the speculum. The latter is principally useful as a means by which therapeutical applications may be made to the uterus and vagina.

Allow me to say again, that I hope you will all be regular in attendance here, as I shall endeavor to make my clinical lectures supplementary to my didactic ones, and thus have the clinics from week to week form a continuous chain. My

aim will be, not to bring before you the most rare and striking forms of disease, or to perform the most brilliant operations in your presence, but to show you just such cases as you will all be liable to meet in your ordinary practice.

It not infrequently happens that country practitioners come to spend a winter in New York, at great sacrifice, to learn just such practical points as I shall endeavor to impress upon you, because they have found, after a considerable experience, it may be, that the diseases peculiar to women perplex them more than any others which they are called upon to treat. I should, therefore, feel greatly dissatisfied with myself if any such (should they be attending the present course) should go away without learning anything here.

I propose to make my teaching entirely elementary, for a long experience has shown me conclusively that it is in the elementary points of gynæcology that a great many physicians, otherwise well posted on their profession, are sadly deficient. The reason that they frequently do not discover disease when it is really present is that they do not look for it properly. Such a one would perhaps say that he had made an examination, in any given case, by means of the speculum, and yet had not been able to find out what the trouble was. But, as I have previously mentioned, the speculum is the least efficient of all the means of diagnosis at our disposal, and it is unquestionably our duty to employ *all* the means which it is possible for us to resort to.

In every instance I shall proceed first to get the rational history of the case from the patient herself, and in doing this I shall always make use of the same general method of interrogating her. Then, having obtained the history, I will resort to a physical exploration, and in making this I shall employ all the means that it is possible to resort to. If you will look at a good examiner of the chest while engaged in making out a diagnosis, you will observe that he does not simply apply his ear to the chest wall, but that he first makes an inspection of the thorax, then measures the two sides of it carefully, and then practices palpation; after which he resorts to percussion and auscultation. By the combination of all these different methods he is enabled to arrive at a conclusion in regard to the case.

So, in diseases of women, we must never jump at a diagnosis. For example, here is our first case now before you. I shall get the history of the patient, and then tell you what I suspect is probably the trouble, from the symptoms described; after which I will make a physical examination and determine the diagnosis positively. What is a diagnosis? Merely the logical deduction from certain premises. What, then, are these premises? The symptoms. And what is the deduction to be drawn from them? The diagnosis.

Some years ago I used to offer prizes for the best report of my clinic during the regular winter course, and I wish I could offer one this year; for I should like to encourage you, by any means in my power, to take notes here. I do not advise you to do so in attending didactic lectures, because all the material given in them is to be found in books; but notes taken at the clinics you will find to be of the highest service. When you get into actual practice cases will come into your hands in regard to which you will be able to learn nothing whatever from the ordinary text-books; but by referring to your notes you may perhaps find precisely similar ones which have occurred here. But now let us turn to our patient.

Case 1.—Laceration of the Cervix Uteri; Subinvolution; Fungoid Degeneration of the Lining Membrane of the Uterus.

This patient's name is Margaret O'C.; she is a native of Ireland, thirty-eight years of age; has been married eighteen years, and has had six children, but no miscarriages. Her youngest child is six years old. Now, let us suppose that this woman comes to consult you at your office. There is something wrong about her, and it is your business, as her physician, to find out what the nature of the trouble from which she is suffering may be. If you will now pay close attention to the way in which I question the patient, you will see the method which I almost invariably resort to for obtaining the rational history in any case, and one which I cannot recommend too highly to you to follow out in your own practice. How long have you been sick? "About two years." Were you perfectly well up to two years ago? "I have not been perfectly well since the birth of my last child, but I have been worse for the last two years." What has annoyed you during that time? "Headache and a dizziness when I go out." Do you ever feel so dizzy that you stagger? "Sometimes." (The symptoms of which she complains, you will understand, gentlemen, is what we call vertigo.) What else do you suffer from? "Hemorrhage from the womb every month." Do you have to go to bed in consequence of this? "Yes." How long does the flow last? "Three days and three nights." Do you ever faint from weakness caused by it? "No; but I feel like it sometimes." What else do you suffer from?

"Pain in the side." Anything else? "The soles of my feet burn, so that I cannot sleep at night."

You observe that I have suggested nothing whatever to the patient; yet she has given me quite enough information to make me suspect some uterine or pelvic trouble, all the symptoms mentioned pointing in that direction. The particular nature of the affection, of course, we do not know as yet, and I now proceed to put a few direct questions. Do you have the whites at all? "Yes, a great deal." Constantly? "Yes; and the discharge has a very bad smell." (This is a point she forgot to mention before.) Have you any headache? "I have some headache, but it is not as bad now as it used to be." Do you have any trouble with your bladder? "I have to pass my water very often."

These are all the points which it is necessary to obtain in regard to the history, and if the patient were in your office, or you were visiting at her own home, you would now proceed to make a physical examination. Let me here remind you that whenever you deem such an examination necessary you should make up your mind to do it *thoroughly*, or else not attempt it at all; for there is no use putting your patient to the annoyance of such a procedure unless you mean to find out in this way all that you possibly can about the case. When you have determined that it really is necessary, appeal to the good sense of the patient, and get her full consent to the exploration. Otherwise it will be utterly impossible for you to conduct it satisfactorily. The examination is then to be carried on as follows:—

Instead of placing your patient on a bed or sofa (or any soft surface), let her lie, on her back, upon a table, on which a blanket and sheet have been spread, with her head resting on a pillow and her knees flexed A table never gives alarm to a patient, and the fact of your employing one is very apt to inspire her with confidence in you. A sheet is then thrown over the woman, and you are ready to commence your exploration. There is nothing that answers the purpose of a lubricating agent for the fingers so well as soap and warm water. This is far preferable to oil or lard, as grease of any kind impairs the tactile power. Then it may very likely be rancid and offensive, and if this is the case, it will act as an irritant to the vagina.

The first part of the examination is really the most important. When I passed my finger into the vagina, in the present case (the examinations, as I have intimated, are always conducted in private here) I found that instead of meeting with a normal cervix uteri, it passed into a wide rent; so that no *os externum* could be felt at all. Then I said to myself, the diagnosis is laceration of the cervix. Let us see if such a condition will account for the symptoms. The prominent ones are vertigo, profuse hemorrhage, fetid leucorrhœa, headache and backache; and it is possible that they might all be due to such a laceration. The patient is suffering from marked anæmia (on which the headache and vertigo may depend), and this may be the result of continuous or periodical bleeding of the torn surface. It would explain the leucorrhœa satisfactorily, and the headache might be the result of reflex irritation from the injured part.

But the examination has as yet only been commenced, and before deciding that we have arrived at a satisfactory diagnosis, it is better that it should be completed. On resorting to conjoined manipulation, by keeping the index finger of one hand at the cervix uteri and carrying the other up to the abdominal walls (so that the uterus might be brought between the two hands), I ascertained that the organ was considerably enlarged. I was unable to find either ovary; nor could I detect anything abnormal about the pelvis.

The next step is to make use of the speculum. I trust none of you understood me to say before that the speculum should not be employed; what I wanted to impress upon you was merely that it should not be relied upon by itself. In order that a satisfactory examination may be made by means of the instrument, the patient should lie upon the left side, with the left arm drawn behind her and the right leg flexed and carried across the left. Sims' speculum is then introduced and held firmly in position by an assistant. When this had been done in the present instance the marked laceration of the cervix was ocularly demonstrated. Having wiped off some tenacious mucus, with a rod wrapped with cotton, I found the surface of a light red color, but absolutely free from any bloody oozing. I then drew the point of a uterine probe over it several times, with some little force; but there was still not the slightest evidence of hemorrhage from it. What, then, I had previously thought might be the diagnosis, was thus, you see, found incorrect, or, at all events, incomplete; because the source of the bleeding was still unaccounted for, and loss of blood is the principal thing for which the patient comes here to seek relief.

I next passed the sound into the cavity of the uterus, and this was followed by quite a little gush

of blood. Now when, in any case, I get a history of menorrhagia or metrorrhagia, and on making an examination find that the uterus is considerably enlarged and that the introduction of the sound is followed by such a sudden gush of blood as was the case here, I have learned, after a very extended experience, to infer that there is almost invariably a certain condition present, which I will shortly explain.

When I found the state of affairs mentioned, I at once took this little curette, which consists of nothing but a loop of flexible copper wire, and introduced it to the fundus. On withdrawing it, nothing came with it; but now, when I carried it up into one horn of the organ, I drew out three little masses, which I now exhibit to you on this paper. At first sight they look very much like blood-clots; but it can readily be seen, on close examination, that they are not of this nature. They are rather polypoid in character; but still are not strictly polypi. The presence of these little growths in the uterus not infrequently causes such free hemorrhage as to give rise to the most serious consequences, and sometimes to endanger life itself. I know of a case where a lady was losing so much blood from the uterus that her physician, without knowing exactly what caused the hemorrhage, was obliged to resort to tampons saturated with persulphate of iron. A month afterward she applied to another practitioner, who, in order to find out what was the state of the interior of the uterus, very properly introduced a sponge-tent. Unfortunately, however, the patient died; and at the autopsy it was ascertained that the hemorrhage had all been due to the presence of these growths in the uterus, somewhat larger, it is true, than those which I now show you, but of exactly the same character. These masses, under the microscope, are found to be nothing but hyperplastic endometrium.

When the patient was delivered, six years ago, the cervix was completely torn through, and it has been ascertained that whenever this is the case in a labor, involution of the uterus does not go on as it ought to. Since then the organ has been constantly congested, and this condition has given rise, first, to the leucorrhœa complained of, and later, to the fungoid degeneration of the uterine mucous membrane, which has caused the bleeding. When I listen now to the heart, I find that there is an immense bruit with the first sound, constituting what is known as a bellows-like murmur, and due, no doubt, to the watery condition of the blood. All this has followed the woman's last confinement.

The complete diagnosis is, then—

First. Laceration of the cervix uteri.

Second. Subinvolution of the uterus.

Third. Fungoid growths lining the endometrium.

If this woman were a patient of mine, in the Woman's Hospital, I should be perfectly willing to tell her that she could be discharged entirely cured in three months' time, should no unforeseen accident occur in connection with the case. It is usually much easier, however, to promise than to effect a complete cure. I know the question will now arise in your minds, cannot such a patient as this be treated at her own home, in the country, for instance? I would reply, undoubtedly she can; and this is what I would advise to be done in any similar case.

In the first place, keep the patient in bed, and see that all fecal accumulation is thoroughly removed. A constant cathartic action should be maintained, but it should by no means be violent. In addition, free vaginal injections of warm water should be frequently resorted to, and the patient should be kept upon a moderate diet, principally of a fluid character. When this regimen has been kept up for a week or ten days, a speculum should be introduced, and the medical attendant, having secured the cervix with a tenaculum, should pass a curette into the uterus, and carefully scrape out the whole cavity. Only yesterday I employed this little instrument in the case of a lady from Orange, who had been losing so much blood that on two occasions her physicians thought she was going to die from the effects of the hemorrhage. She had been flooding terribly for no less than ten years, notwithstanding the fact that fuming nitric acid and other powerful agents had been applied to the endometrium. In her case I actually removed an even teaspoonful of these fungoid granulations, by means of the curette.

Any one of you can perform this simple operation as well as I, and with the instrument I recommend and use myself, it is impossible, I believe, to do any harm. All such growths can be removed with the exertion of but very little force indeed, and although for a long time I have been in the habit of applying the curette to the uterine mucous membrane at least once a week, I have never known the slightest accident result from its use. By this means, then, we remove the principal symptom in the case, viz.: the menorrhagia. In consequence of this, her general health would become greatly improved, the irregularity of the heart's action would cease, and the derangements of the nervous system (to which such symptoms as the

burning in the soles of the feet are due), would be corrected. The leucorrhœal discharge would also become greatly diminished; although this is, no doubt, due in part to the laceration of the cervix.

In about ten days after the application of the curette, it would be proper to perform an operation for the relief of the latter condition. This is a very simple matter. If you wanted two fingers, for instance, to become agglutinated, you would pare a surface of equal area on the side of each, and then keep the denuded surfaces in apposition by some mechanical contrivance until they had become firmly united. This, I assure you, is all there is about the operation for laceration of the cervix. We have merely to pare the torn surfaces with the scissors or knife, and then retain them in apposition by means of silver wire sutures. A young operator may, perhaps, fail once or twice in securing union properly, but he will soon learn to do it as well as anybody.

Two great foci of irritation will have been thus removed (by the application of the curette and the sewing up of the lacerated cervix), and the uterus being, in consequence, rendered of less gravity and smaller in size, will be found to rise higher up in the pelvis; although in order to keep it up properly in position it may perhaps be necessary for the patient to wear an elastic ring pessary for a time. The uterus will no longer be large, heavy and congested, the leucorrhœa will probably cease altogether, and within three months the patient will be perfectly well. This, then, belongs undoubtedly to the class of curable cases.

Case 2.—Procidentia Uteri, with Ruptured Perineum, Cystocele and Rectocele.

In the next case I am going to exhibit the trouble to you for the reason that there is something here which can be readily seen by the class. This poor woman, whose face I shall allow to remain covered with the sheet, is suffering, as you perceive, from what is known as falling of the womb. What you see at the lower portion of the mass extruded from the vulva is the lacerated cervix with its everted edges, and you will observe that in part the bladder is dragged down with the uterus, while there is a rectocele behind. With this state of affairs existing, it is not difficult to imagine how much the patient must suffer from pain in the back, a sense of dragging and weight in the pelvis, irritation of the bladder and rectum, and other troubles incident to such a condition.

In this instance the sound passed just five inches into the uterus; which must, therefore, be twice the normal size of the organ. This, then, is a case of complete prolapsus uteri, or, as it is sometimes called, procidentia uteri; although I must confess that I see no use in thus multiplying terms. This state of affairs resulted entirely from labor. The cervix became lacerated, and the edges of the wound never becoming united, involution did not take place, and the uterus consequently remained large and heavy; so that it sank gradually lower and lower in the pelvis, as its normal supports gave way, one after another. You see that I can very easily restore the uterus to its proper position; and if the patient had been placed in the knee-chest position, it would have replaced itself. The woman's nervous system is much exhausted, and it is quite time that something should be done for her relief. The first thing that ought to be attempted here is the sewing up of the lacerated cervix, and I hope I shall have the opportunity of doing this before you one week from to-day. This is a peculiarly good case for class demonstration, as the operation can be performed outside of the body, and need not be done through a speculum, as is ordinarily the case. At a later period I propose to operate for the procidentia.

The patient's name is Margaret H., twenty-eight years of age. She was born in Ireland, has been married five years, and has had one child, but no miscarriages. The child was born two and a half years ago.

Case 3.—Complete Rupture of the Perineum—Pelvic Abscess.

Mrs. Ellen R., born in Ireland, thirty-three years old; been married thirteen years, and had four children; no miscarriages.

How long have you been sick, Mrs. R.? "Since the birth of my last child, six months ago." How have you been complaining? "I have had a great deal of pain in the bowels." Where have you felt the pain particularly? "In the back and side. It is so bad that I cannot sleep at night." Do you ever have a passage from your bowels or pass your water without being able to control it? "No." Do you have to go to the water-closet frequently? "All the time; so that I have to take a great deal of paregoric."

I have received a letter from this patient's physician, and he says that she is continually passing laudable pus. Her pelvis is considerably contracted, and she was only delivered after a very difficult labor, during the course of which the whole perineum and two inches of the rectum were torn through. In consequence of this,

there is a loss of power of all the muscles in the vicinity of the anus, and yet, strange to say, she still retains control of the sphincter; although she is obliged to evacuate the contents of the rectum at frequent intervals. This is a most unusual exception to the general rule in these cases of extensive laceration; for ordinarily the fecal matter is escaping all the time, and the woman's life becomes perfectly miserable. The condition of such a patient is worse than that of one suffering from vesico-vaginal fistula, because the odor of fæces is more intolerable than that of urine. Yet, as I have said, this is not the case here, and the woman would not be much annoyed were it not for the discharge of pus from the rectum.

Now let us inquire into the source of the latter. Just above the superior strait of the pelvis, on the left side, there is a large tumor, which lies in close contact with the descending colon. This is undoubtedly a phlegmon, and from this has resulted an abscess, which is still discharging pus into the intestine. For the origin of this we are to look to the labor mentioned, which must have given rise to a localized peritonitis.

The next question that comes up is, what can we do for this patient? In a surgical point of view there is nothing to be done at present. The laceration of the perineum is doing no injury, and need not be interfered with. As to the pelvic abscess (which is a mass composed of lymph surrounding a cavity filled with pus), if it were operated on, fatal peritonitis might easily be set up. But you say, can we do nothing for this abscess? I fear not just now. If we were to enlarge the opening into the intestine, which is presumably quite minute, fecal matter would probably flow through it, and we should have the cavity filled with this, which would be a much more serious matter than to have it filled with pus, as at present. On the other hand, it would also be extremely hazardous to attempt to evacuate the abscess externally, as things are now situated. After building up the strength of the patient, by appropriate supporting measures, however, we might apply an escharotic externally (which might be repeated from time to time), for the purpose of causing an adhesion between the abscess and the external parietes. When this had taken place, there would no longer be any danger in freely opening the abscess.

—Diphtheria has been malignant in Somerset county, Pa., this year. Many families have lost most of their children by it, and others have moved away, to escape the epidemic.

Communications.

ARTIFICIAL FOODS FOR INFANTS.

BY VIRGIL O. HARDIN, M.D.,

Physician to the Rhode Island Hospital, Providence, Rhode Island.

(Extracted from a paper read before the Rhode Island State Medical Society.

* * * * Condensed milk is sometimes used in the artificial feeding of infants. It is sold in hermetically sealed cans, and when recently opened and diluted with water presents some of the properties of fresh cow's milk. It consists of cow's milk reduced to one-fourth its original volume and sweetened with cane sugar. It is open, however, to the same objections as milk taken from a herd of strange cows indiscriminately, inasmuch as we know nothing whatever of the source whence it is derived, or from how many different animals it is obtained. It is not at all probable that the care is taken in regard to the quality of the milk used for this purpose that should be exercised in the selection of fresh milk for the food of the infant. Moreover, the addition of cane sugar in the preparation of it is a serious objection to its use, for reasons already stated. But aside from these theoretical considerations, F. H. Daly* has shown that infants do not thrive upon it as they do upon fresh milk. They may grow fat and appear healthy, but they are more liable to diarrhœa and other derangements of the alimentary canal, and sink rapidly when so affected. They will take it readily, on account of its agreeable taste, but it does not seem to furnish the necessary material for preserving the natural vigor and vitality of the child. For this reason the question may very properly be asked, why should it ever be used when fresh milk can be obtained? The answer will probably be made that it is difficult to obtain pure milk from a single cow in our large cities. But in using condensed milk we are entirely ignorant of the source whence it is derived, and it is safer to trust to the honesty of the milkman than to unknown manufacturers, located, perhaps, in a foreign country. It is only when the child is placed in such circumstances that it is impossible to obtain fresh milk, that condensed milk will offer any advantages that should lead to its use. On voyages at sea or journeys on the land it is frequently useful in this way. But to substitute it for fresh milk when the latter is equally obtainable, is an act of which the absurdity is apparent at a moment's thought. The composition of the "Anglo-Swiss" brand

* *Lancet*, November 2d and 9th, 1872.

of condensed milk is as follows, according to Pavy*:—

Casein	18.52	Ash	2.12
Fatty matter	10.80	Phosphoric acid	.649
Sugar of milk	16.50	Water	24.30
Cane sugar	27.11		

Taking the amount of casein as the basis of computation, it will be seen that this preparation must be increased by three times its volume of water, to reduce it to the strength of cow's milk. But the proportion of fat is very much less, and of sugar very much greater than in the latter. There exists, therefore, a marked deviation from the normal standard, and less approximation to the natural food of the child than in giving milk fresh from the dairy. Consequently, this method presents no advantages which should lead to its adoption, except when fresh milk cannot be obtained. But under such circumstances it may be used, and is probably better than any artificial substitute that could be devised. It contains the nutritious principles of milk in the natural form, although not in the natural proportions. It would be better, however, if sugar of milk were used in its preparation, instead of cane sugar.

A second class of alimentary substances which have been used in the artificial feeding of infants comprises various mixtures, so prepared as to contain the same proximate principles in the same proportions as are found in milk. The idea originated with Liebig, who wrote a book† advocating the use of his "food for infants," which was prepared upon the principle just stated. All subsequent preparations of this class are but imitations of his, and do not differ materially from it. We may, therefore, take Liebig's food as the type of this class. The method of preparing it is as follows: Take half an ounce of wheat flour, half an ounce of malt flour, and seven and a quarter grains of the crystallized bicarbonate of potash, and after well mixing them, add one ounce of water, and lastly, five ounces of cow's milk. Warm the mixture, continually stirring over a very slow fire, until it becomes thick. Then remove the vessel from the fire, stir again for five minutes, put it back on the fire, and finally let it boil well. It is necessary that the food should form a thin and sweet liquid previous to its final boiling. Before using, it requires to be strained through a muslin or fine hair sieve, to separate fragments of husk that may be present. The bicarbonate of potash is added, to neutralize the acid reaction of the two kinds of flour, and also to raise the amount of alkali in the food to the equivalent of that in human milk. The ferment contained in the malt leads, during the exposure to the warmth employed in the process of preparation, to the conversion of the starch of both the flours into dextrine and sugar, the latter of which gives the sweet taste that is acquired. The solubility of the newly formed products accounts for the mixture becoming thin, and it is a point contended for by Liebig, that principles in this state tax the digestive and assimilative powers of the infant much less than starch. This food has been extensively used in Germany, and has had numerous advocates in this country. But the claims advanced in its favor are far beyond its real merits. If we examine its composition we shall find that out of seven parts of the mixture, five consist of cow's milk alone and one of water. The remaining seventh is composed of wheat flour and malt flour made from barley, both of which consist almost exclusively of starch. During the heating of the mixture, the ferment contained in the malt produces a chemical change in the starch, whereby the latter is converted into dextrine and glucose, or grape sugar. Speaking of dextrine, Pavy* says, "Being readily convertible, in the same manner as starch, by some of the digestive secretions, into sugar, it is probable that when it happens to be consumed it is transformed into sugar and in that state absorbed." So that the wheat flour and the malt flour are merely the equivalents of so much sugar added to the mixture. The bicarbonate of potash has no value as a nutritive substance, as it passes out of the body unchanged and does not contribute to its formation or preservation. To sum up these, we have in the mixture five parts of milk, one part of water, and the equivalent of one part of sugar. In what respect does this differ from the diluted and sweetened cow's milk that has always been used in the artificial feeding of children? It is only a clumsy and roundabout way of arriving at a result which may be directly reached by the simplest of methods. It presents no advantage, either in point of digestibility or of nutritive value. On the contrary, it clogs the stomach with a foreign substance, dextrine, and throws upon the alimentary canal the additional labor of converting this substance into sugar before it can be absorbed. The use of it compels the system of the child to manufacture out of the raw material the food which nature with a more generous hand furnishes ready made.

A third class of alimentary substances used as

* "Food and Digestion" page 178.

† "Food for Infants:" London, 1867.

* Op. cit., p. 106.

food for infants consists of starchy and farinaceous preparations, in almost an infinite variety of forms. In this class must first be placed the various kinds of flour made from the cereal grains. Why these should be recommended by writers upon the hygiene of infancy it is difficult to conceive, since they possess not a single property in common with the food which nature provides. They all consist largely of starch, a substance which does not exist in milk, and which the stomach of the infant is not capable of easily digesting. The nitrogenized elements are in the form which is least susceptible to the action of the digestive fluids, while the proportion of fatty matter is so small as to practically amount to nothing. The following table, from Letheby,* will sustain these statements:—

	Nitrogenous Matter.	Carbo-hydrates.	Fatty Matter.	Mineral Matter.	Water.	Carbonaceous to one Nitrogenous.
Wheat Flour..	10.8	70.5	2.0	1.7	15.0	7.0
Barley Meal...	6.3	74.3	2.4	2.0	15.0	12.8
Oat Meal.....	12.6	63.8	5.6	3.0	15.0	6.2
Rye Meal.....	8.0	73.2	2.0	1.8	15.0	9.8
Indian Meal...	11.1	65.1	8.1	1.7	14.0	7.7
Rice	6.3	79.5	0.7	0.5	13.0	12.9

To this class also belong the various proprietary preparations, called "infants' food," with which the market is flooded, and which are usually sold under some high sounding name, which is as meaningless as it is fanciful. Pepsinated nutriment, papoma, Ridges' food, semolina, maizena, and a host of others, are samples of this class. Wonderful virtues are claimed for all of them, but a most superficial inspection will show that they are simply farinaceous preparations made from the cereal grains. Hassall† analyzed fourteen such preparations, purchased by him in the London market, and found that ten of them consisted of wheat flour, two of gluten mixed with a little starch, one of bean flour and arrow root, and one of rice flour. Their nutritive value may be readily judged of from their composition. A third variety of food of this class consists of preparations composed wholly of starch, such as tapioca, arrow root, sago, cassava, tacca and salep. These substances possess no nutritive value beyond that belonging to starch. They contain no nitrogenized matter, no fat, no sugar, no salts. They are even further removed from milk in their composition than are the cereal preparations. And yet they are extensively used as a desirable food for the infant, and are even recommended by eminent writers upon the treatment of diseases of children.

In order to fully appreciate the exact nutritive value of the substances of this class, it is necessary to understand the position held by starch as an article of diet. Starch is a principle which, so long as it retains its own form, is incapable of undergoing absorption into the circulation. By the processes of digestion it is first converted into dextrine, which has only a very brief existence, and is immediately converted into sugar, in which form it admits of ready absorption. There are three digestive fluids which are capable of converting starch into sugar, namely, saliva, pancreatic juice and the intestinal fluid. As saliva does not exist in the infant, according to Pavy,* previous to the eighth month, it may be left out of the question entirely. In order that starch may be converted into sugar by the action of the pancreatic and intestinal fluids, it is requisite that it should first be disintegrated and broken up, and a prolonged contact with those fluids is necessary in order to accomplish this result. Even under the most favorable circumstances, the whole amount of starch ingested is never converted into sugar, but portions of it are always to be found in the fæces. It is absorbed under the form of sugar, and enters the general circulation only after undergoing a metamorphosis, the nature of which is not fully understood. Its function has been clearly shown by Pavy† to be the same as that of the other hydrocarbons, namely, the production of force and heat. There are several reasons why starch is inferior to fat and sugar as an ingredient of infant's diet. In the first place, it cannot be reduced to the liquid form. The absence of teeth to accomplish mastication, and of saliva to facilitate deglutition, shows conclusively the design of nature that the food of the child should be in the liquid form during the first few months of its existence. Starch may, however, be suspended in various liquids, and the child will not refuse to swallow it, and if no other objections to its use existed, this alone would not be an insuperable one. In the second place, upon reaching the stomach it is not acted upon by the gastric juice, but retains its solid form until it passes on into the small intestine. All the constituents of

* Op. cit., page 5.

† "Food and its Adulterations," page 237.

* Op. cit., page 476.

† Op. cit., page 107.

milk are reduced to the liquid form in the stomach. Even casein, which is at first coagulated by the gastric juice, is soon redissolved into albuminose. The albuminose envelopes of the fat globules are dissolved and the fat set free, and thus the contents of the stomach take the form of a bland liquid. But if starch be present, it is not to be dissolved, but goes scraping its way over the delicate and sensitive mucous membrane of the pylorus and duodenum, producing spasmodic contractions of the irritated circular muscular fibres and causing the child to cry with pain. Upon reaching the pancreatic and intestinal fluids, several hours are required for its disintegration and conversion into sugar, to fit it for absorption. Letheby* says that "starch will pass a considerable distance along the alimentary canal without much change, and it is only toward the end of the small intestines that the starch granules undergo marked disintegration." But nature never intended that the food of the child should remain in the small intestine for so long a time. The instinct of the infant leads it to seek its food about once in two hours, and before the starchy contents of one meal are absorbed a fresh burden is thrown upon the digestive tract, and thus the undigested material accumulates, until the intestine is emptied by the occurrence of diarrhœa.

But even if starch were a desirable form in which to administer carbonaceous food to the infant, the proportion of this element contained in the farinaceous preparations of this class is far in excess of that required by the system of the child. In milk the proportion of carbonaceous to nitrogenous material is as three to one. In the cereal grains it varies from 6.2 in oat meal up to 12.8 in barley meal. This excess constitutes so much waste of alimentary material which the system is compelled to dispose of, and from which it derives no benefit. In infancy the vital processes are chiefly directed toward developing the various organs and increasing the amount of the various tissues of the body. Almost the only force to be produced is that which is employed in carrying on the various vital processes, such as circulation, respiration and alimentation. The increase of the child in weight during the first year of its life is very rapid, and to accomplish this increase an adequate proportion of nitrogenous food is required. But in the starchy substances named above the nitrogenous matter constitutes only about 12 per cent. of the material, while in milk it forms 30 per cent. The human system also requires a certain amount of fat as an ingredient of its food. Besides its principal function of producing heat and force, which it shares with the other hydrocarbons, it has a special function of its own. A certain part of it escapes oxidation and is appropriated as one of the anatomical elements of the body. It fills up interstices between other anatomical structures, and gives a regular and rounded form to the outer surface of the body. As a poor conductor of heat it contributes toward retaining the animal warmth. It also forms a store of force-producing material, to be drawn upon as circumstances may require. We accordingly find that in milk the fatty matter constitutes 22 per cent. of the solid material. But in the farinaceous foods, on the contrary, it constitutes only 2½ per cent. in wheat flour, rye meal and barley meal, 6 per cent. in oat meal, and 9½ per cent. in Indian meal.

As a further proof, if any were needed, that these substances are not suitable food for the nourishment of the infant, may be cited the fact that experience has shown that they can never be used alone or mixed with water, but must always be combined with a large quantity of milk. Under such circumstances the milk forms the nutritive portion of the mixture, and the flour or meal is so much superfluous material. Hammond* has shown conclusively, by experiments upon himself, that an exclusive diet of starch will not support life. Let a child be fed upon any of the starchy preparations alone, and he would die of starvation, as did the rats upon which Savory† tried this experiment. From whatever point we approach the subject, we are led to the one inevitable conclusion, that no preparation composed wholly or principally of starch is a suitable food to be used in the artificial feeding of infants.

† Lancet, April 4th and 11th, 1863.

STRANGULATED HERNIA, WITH FECAL FISTULA, TREATED BY A NEW AND SIMPLE ENTEROTOME AND AN ANAPLASTIC OPERATION.

BY WILLIAM A. BYRD, M.D.,
Of Quincy, Ill.

October 9th, 1878, I was called to Seehorn, Ill., to see Mr. John Lyons, a farmer, aged 55, who was suffering with strangulated hernia.

Dr. J. H. Aleshire, his family physician, gave the following history of the case: October 5th, he was called to see the patient, for what the family supposed to be cramp colic, with vomiting,

which he found upon examination to be the result of a strangulation of an inguinal hernia of the left side. The hernia was congenital, but had never before given any serious trouble; neither had a truss been worn.

Taxis not relieving him the Doctor spoke of counsel, and perhaps the necessity of an operation, to which the patient objected. The Doctor gave anodynes and returned the next day, when the symptoms still persisting, taxis was again tried and again failed. The patient still objecting to an operation. This state of affairs continuing until the afternoon of the 8th, the Doctor determined to have counsel, whether the patient was willing or not, and sent for Dr. L. H. Baker, of Payson, a surgeon of ability and experience, who, upon arriving, which was about midnight, decided that the case was almost hopeless, and the operation for his relief would be of so critical a nature as to require all the light possible for its proper performance. The Doctors concluded to wait for morning, and sent for me to assist them.

I arrived at ten o'clock, and found the patient almost pulseless, semi-comatose, with cold clammy sweat and œdematous crackling in the areolar tissue at the point of strangulation. The case looked hopeless; still I agreed with the other gentlemen in advocating an operation. Dr. Baker, himself an old and skillful operator, insisted upon my performing the operation, which I did.

When the sac was opened it contained extravasated fæces, a mass of gangrenous omentum, and eight inches of gangrened intestine, that had separated for nearly half its diameter, both above and below. There were slight adhesions above the line of demarcation. The omentum was pulled down and ligated *en masse*, just above the mortified portion, which was cut off, and the long ends of the ligature were left hanging out of the wound.

The gangrenous portion of intestine was cut off at the lines of demarcation, and the healthy ends stitched into the opening in the abdomen, which was two inches and a half in length, the lower and inner end with three and the upper with two sutures.

As a portion of the contents of the bowel unavoidably entered the abdominal cavity, it was cleaned out as well as possible, and the two ends of the bowel were not stitched to each other, that an opening might be left for drainage and the withdrawal of the ligatures that were applied to the omentum. When the operation was ended his pulse and other symptoms were better.

Dr. Aleshire continued in charge of the case, and washed out the wound and the cavity of the abdomen in its vicinity, night and morning, by injecting a solution consisting of a teaspoonful of table salt and a teaspoonful of carbolic acid to the gallon of water.

The patient made a rapid recovery, being put upon good diet, opium, cinchonidia and whisky, for after treatment.

December 26th, 1878, he came to this city to enter St. Mary's Hospital, for the purpose of having an operation performed for the closure of the fecal fistule. The discharges rendered him disagreeable to himself and loathsome to others.

At the time of the operation for the relief of the strangulation he was very thin of flesh, and had been suffering with malarial diseases for four years. When he came to the hospital he had entirely recovered his health and gained forty pounds in weight.

A crest-like septum existed between the openings, about a quarter of an inch thick. The mucous membrane prolapsed or rolled out, making the combined openings appear to be two and a half by four inches in size. Over this he wore compresses, to restrain the passage of fecal matter, and catch it when it did pass.

The upper opening passed inward, upward and backward, and the lower passed inward, parallel with the upper for about two inches, and then turned across the body to the caput coli.

I had read Dr. David Prince's article upon closure of artificial anus, in the October 1869 No. *American Journal of the Medical Sciences*, p. 412, *et seq.*, and liked his idea of very gradual pressure to procure adhesive inflammation and an opening through the septum between the intestines, better than anything I could find in the various works on surgery, including the exhaustive disquisition in the *Medical and Surgical History of the War*, part second, Surgical Volume.

Dr. Prince's instrument is unnecessarily complicated, and could be made much simpler and just as effective with a single piece of spring wire, as in Fig. 1.

Fig. 1.

His experience of the septum uniting behind the ligature as it cut through decided me to use an instrument that would take out a round or elliptical piece, as do the enterotomes of Delpech, Gross and Lotz, with the advantage of light elastic pressure, as in Dr. Prince's instrument. Such an instrument I succeeded in devising and constructing, with Dr. Aleshire's assistance, out of a

Fig. 2.

piece of steel wire, such as is used for bed springs. See Fig. 2.

This instrument we applied by passing a prong down each of the ends of the bowel, for an inch and a half, and permitting it to clasp the septum, December 26th, 1879, at 3 P.M. Fourth-grain doses of morphia were ordered every hour, to allay pain, if necessary.

The next morning the Sister in charge informed me that there had been so little pain that two powders subdued it.

29th, I slipped an elastic strap over the arms of the enterotome, so as to increase the pressure.

January 2d, the fenestrated rings had cut through, and he had a passage per rectum in the morning, the first since the 5th of October.

The bridge of tissue was destroyed by passing an elastic cord through the opening made by the enterotome and tying it tightly over a gallows erected upon a tin disk with a hole through the centre, as in Dr. Prince's operation, which took three days longer.

A flat piece of lead, one-fourth of an inch in thickness, and large enough to cover the opening, was adjusted as a pad to a spring truss. Owing to this pressure the opening rapidly decreased, until about one-half its former size, and most of the fæces passed through the rectum.

January 31st, the opening ceasing to decrease in size, and the septum seeming to come nearer the surface, by contraction, and to stand up for three quarters of an inch between the ends of the bowel, offering a greater obstruction to the passage of the fæces from above downward than it did immediately after it was first divided, I re-applied the enterotome to the projection. It cut through as before, and was removed, February 4th, when, with the assistance of Dr. Jacob A. Wagner, I applied the galvano-cautery to the outer edges of the opening, to induce contraction.

February 15th, there having been very little contraction, with the assistance of Dr. Wagner, I freshened the edges of the opening with a knife and united them with iron wire sutures. The next morning I found him suffering great pain, from the fæces distending the bowel and exuding between the sutures. My friend, Dr. M. Rooney, being at the hospital earlier than myself, had given him some relief with a hypodermic injection of morphine. I cut the sutures and allowed the fæces to escape freely, which gave immediate relief.

Having failed to effect a closure of the fistule by that simple operation, I devised the following method, and with the assistance of Mr. Joseph Hollybush, a medical student, made the operation, February 7th. By catching the integument into a fold on either side of the fistule, the tops of the folds could be easily brought together over the fistule. An incision was made along the top of the folds, down to the areolar tissue, and continued entirely around the fistule; this incision was about three-quarters of an inch from the fistule. Two iron wire sutures were then passed three-quarters of an inch back from the incision, emerging through the incision, crossing the fistule and integument, and entering the incision on the opposite side, and coming out of the skin three-quarters of an inch from its point of entrance into the incision. See Fig. 3. *A* is the fistule, *B* the surrounding incision. A Bozeman shield and shot clamp being placed upon one end of the wire and tightened, and traction made on the other end, the folds would be reproduced, and the skin next the fistule, having its edge turned, in or inverted, would bring nearly an inch of fresh, raw surface in apposition all around the fistule. Fig. 4 shows a cross section after the stay sutures have been tightened. *A*, caliber of the bowel, with the inverted skin pointing in, in a **V** shape. *B*, skin external to the incision, brought together with a suture.

FIG. 3.

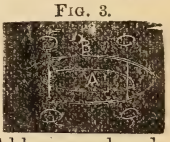

FIG. 4.

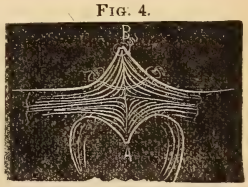
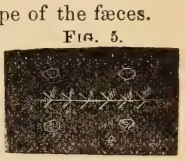


Examination of this figure will show that the fæces, in passing downward, would not act as a wedge to tear open the wound, as in any other mode of closure, but coming up on both sides of the **V**-shaped projection, they press the raw surfaces together, contributing to their adhesion, while the shape of the projection causes it to act as a valve, to prevent the escape of the fæces.

Fig. 5 represents the parts after the stay-sutures are tightened and the edges of the external skin have been united with interrupted sutures.

FIG. 5.



Union by first intention occurred throughout, except a portion of the inner end, leaving an opening the size of the end of the little finger, which gradually decreased until it was not larger than a small lead pencil, and permitted no fæces, unless very fluid, and a little gas, to escape.

Discharged February 8th. The patient, when discharged, had a morbid fear that the opening would close entirely up, thinking that if it did he would die. I do not know that it has entirely healed yet, but fear he has prevented it, from

not understanding the condition of affairs. I think I would have secured union throughout from my last operation, if there had been three stay-sutures used instead of two.

Dr. Frank H. Hamilton, in his valuable work on surgery, states that about three out of five die that are operated upon for strangulated hernia, which seems like too great a per cent., and permits such statements to be made as, "Dr. Druitt has justly observed, ovariotomy need not fear to be judged by such results as these, which are far more favorable than those after the larger amputations, and after herniotomy and lithotomy in the adult." *Medical Press and Circular*, June 18th, 1879, p. 489. Personally I do not think I have the right to draw a comparison between ovariotomy and herniotomy, as I have performed ovariotomy but once, and that one successfully. In the last five years I have performed herniotomy twelve times, with three deaths; of the patients that have died one was eighty-seven, another seventy-six years old, and the other one in the last stages of consumption. Two of those that recovered were over seventy years old. Such good results I attribute to early operative interference, and in an article contributed to the Richmond and Louisville *Medical Journal*, for January 1877, entitled, "When to Operate for Strangulated Hernia," I insisted upon the safety of the patient in the great majority of cases being greater the sooner the operation, after a short taxis fails to reduce.

Bryant recommends that taxis be tried for five minutes, and failing, that herniotomy be immediately resorted to. Although this may seem like hasty practice, it is infinitely superior to long continued taxis, frequently so forcible as to cause peritonitis or reduction *en bloc*, followed by the death of the patient, leaving the operator but one consolation, that the mischief he has produced is so hidden that no one knows it, allowing him to place the responsibility of the bad result upon the Lord.

Hospital Reports.

PENNSYLVANIA HOSPITAL.

CLINIC OF DR. R. J. LEVIS.

REPORTED BY J. F. SOUWERS, M.D.

At the last clinic I had under consideration the subject of simple fractures of the femur. To-day I purpose making some remarks on compound, comminuted and complicated fractures, using for illustration the cadaver on the table, which had been the subject of such injury. Fractures are either simple, compound or complicated. A simple fracture is merely a solution in the continuity of the bone; a compound fracture is one in which there is violence done to the soft tissues, associated with perforation of the integument. When the bone is more or less splintered or broken into fragments, we class it under the head of comminuted fracture, and under the head of complicated when the fracture has penetrated a joint, or when an important vessel or nerve is implicated. These cases nearly always owe their origin to extreme violence, and the prognosis is much less favorable than that of simple fracture, owing to the injury of surrounding structures, the greater shock to the system, and the tendency to hemorrhage, secondary inflammations, etc.

In a large proportion of these cases of compound fractures of the leg and thigh, there is not only breakage of the bone, but an oblique protrusion of the ends of the fragments, which protrusions are at times very difficult of reduction. This man was the driver of a stone truck, such as is used in the transportation of large blocks of granite and marble. While driving his foot slipped, and he was thrown under the wheels of the truck, which passed over his thigh and leg; the result of this crushing and, at the same time forward moving, weight, was, as you will perceive, a compound fracture of the femur and a compound comminuted fracture of the bones of the leg; the ends of the fracture are exposed to the atmosphere, and the soft tissues are greatly lacerated. He died shortly after admission, from shock, which is one of the great dangers we have to contend against in these cases. There was little, if any, hemorrhage. The question now is, how should these cases be treated? The first rule is to reduce the fracture as nearly as may be to the condition of a simple fracture; if you find small splinters or fragments of bone in the wound, remove them, as I did in this case, before proceeding to any other measures, first having had such foreign substances as street dirt, etc., sponged away; if there be not much laceration of the soft tissues, you bring the edges of the wound together after effecting reduction of the fracture. The question now arises, how are we to effect and maintain reduction? In many cases simple extension and counter extension will be all that is necessary, but in many cases the tonicity and irritability of the muscles acting on an oblique fracture will cause a constant reprotrusion of the ends of the bones, as was the case in this fracture under consideration. We can at times maintain reduction by tiring the muscles out and overcoming their tonicity; this is effected by making constant traction on them. In the leg low down this is difficult of accomplishment, but you may attain the object by the temporary use of the stirrup bandage; or by a gaiter applied to the ankle. The former may be applied as follows: Take a bandage and pass it once around the ankle, turn it under, then carry one end down the side of the ankle, under the sole of the foot, and up to the encircling bandage of the ankle, under which it is again turned; an extension cord can now be passed through the stirrup portion of the bandage, the weights adjusted, and the temporary dressing is complete. When the fragments are forced through

an opening too small to admit of their replacement, you can pursue either one of two plans: either enlarge the opening, if that would seem to offer a favorable way out of the difficulty, or saw off a section of the bone; frequently by manipulating the integument, by means of a spatula, a spoon handle, or a smooth stick, the fragments may be returned to their proper places. In those cases where contraction of the muscles interferes with the reduction, especially when the fracture is situated low down in the leg, tenotomy may be performed, dividing the tendo-achillis.

Another expedient, where there is constant tendency to re-displacement, is the wiring together the ends of the fractured bones. This is performed by drilling a hole through the ends of the bones by means of a bone drill, and ordinary wire is then passed through these openings, the fragments brought into position and the wire tightly twisted. In those cases in which, owing to the amount of laceration, it is impossible to altogether reduce to the condition and treatment of simple fracture, we use what is known as the "bran dressing." This is applied as follows: the limb is placed in an ordinary fracture box; new, clean bran is then poured into the box and closely applied to the limb; on the torn tissues is placed the carbolized oil dressing, this consisting of nothing but lint saturated with carbolized oil; if desirable some carbolate of lime may be added to the bran. This bran dressing presents many advantages; primarily, it acts as a cushion, and effects a certain amount of pressure, which is, of course, desirable; it absorbs pus and other discharges, and in cases of hemorrhage, by its absorbent, action and consequent swelling, and extra pressure, it tends to allay the bleeding; when soiled by discharges it may be scraped away and fresh bran substituted, without the necessity of in any way disturbing the limb till the bone has reunited. This dressing has also the important merit of keeping flies from depositing their larvæ in the wound.

Editorial Department.

Periscope.

Theory of Sea Sickness.

Dr. Henry Naylor writes to the *Lancet*, August 23d, of this affection—

The theory I propose may be called the cerebral anæmic theory. The rapid swinging of the vessel, and the body with it, irritates the eyes and vision, and this, by reflex action, produces a spasm of the cerebral capillaries; this explains the feeling of faintness and giddiness that comes on suddenly, just as the vessel gives a big swing. The sudden emptying of the cerebral vessels causes the stomach to sympathize, resulting in efforts of vomiting, whether the stomach be full or empty. These symptoms are the most distressing when the subject is in a standing or sitting position, with the eyes open. If he lies down the change of position relieves the anæmia, the faintness and giddiness pass off, and the sickness ceases. But occasionally, even the recumbent position does not give relief if the eyes are kept open. When they are shut the symptoms are not felt in the least. I have known this to be the case with several ladies who were never comfortable while at sea unless they were lying down with their eyes closed. They were able to eat meals and retain them if they laid down and closed their eyes immediately afterward. In fact, I have been obliged to keep some constantly in bed, to prevent their dying of starvation. A fact that helps to show the feasibility of the anæmic theory is, that brandy and other stimulants give considerable relief for a time, which would not be the case if the cerebral congestion had to do with sea sickness. The explanation of how sea sickness continues so persistently in some is, that the sickness weakens the heart's action, and this keeps up the cerebral anæmia, and that in turn again produces the sickness; so that prolonged sea sickness is due to a circuit of causes, the one producing the other—the visional irritation, cerebral anæmia, sickness, weak heart's action.

With reference to nitrite of amyl, Mr. Leeson says, if it is to do any good, it must do so at once. This is because the medicine, being an antispasmodic, relieves the spasm of the cerebral vessel, and thus the brain is refilled with blood. But if it fails, then the persistent sickness, by its effect on the contractions of the heart, prevents the brain from getting a sufficient supply of blood, and thus the brain becomes anæmic, not from a spasm of the capillaries, but from an insufficient power of the heart. It is at this stage that alcoholic stimulants, in small doses frequently repeated, give great relief.

Physiological Experiments with Ergot.

In a monograph on this subject, by Dr. Peton, of Paris, reviewed in the *Medical Times and Gazette*, the reviewer says—

The most striking results which Dr. Peton observed, and those which appear the best ascertained, and least liable to misinterpretation, are the following: He injected ergotine at the base of a rabbit's ears. In five or six minutes both ears began to get anæmic, and the pupils to dilate; this gradually increased, and lasted several hours. Its intensity and duration varied according to the dose of ergot given. Dr. Peton next divided the sympathetic in the neck of a rabbit, and dilatation of vessels and contraction of pupil on the corresponding side followed, as usual. The ergot was then injected, as in the before-mentioned experiments; its administration was followed by anæmiation of the ear and dilatation of the pupil. The author

then, in another experiment, divided both the sympathetic and the great auricular, and when the vascular dilatation and contraction of pupil was at its height, injected ergot. The resulting anæmiation and dilatation of pupil were as pronounced as before. To ascertain the comparative effect of injecting ergot at a greater or less distance from the part at which its action was desired, Dr. Peton, after having divided the sympathetic of a rabbit on one side, injected the drug into the buttock. Anæmiation of the ear and dilatation of the pupil followed, but not to the same degree as had been noticed when the injection was made into the neighborhood of the part itself. When ergot was taken into the stomach, not only was a much larger dose required to produce an effect equivalent to that of hypodermic injection, but the result was slower and less certain. Dr. Peton concludes that the effect of ergot is not produced through the nervous system, but that it has what may be called an elective affinity for unstriped muscular fibre, acting directly upon this structure; and that subcutaneous injection is the best and most certain mode of securing its effect.

Treatment of Dysentery in Children.

Dr. Charles Bell, in the Edinburgh *Medical Journal*, September, 1879, after condemning the treatment recommended by Dr. Meigs for this disease, proceeds to say:—

The most useful treatment will be warm baths, poultices, and leeches, and small doses of calomel and James' powder, to be repeated every two hours until the fever subsides, and the bowels are gently moved, and their evacuations become more natural. If they are much tinged with blood, a few drops of the liquor ferri pernitratis, in a little sugar and water, may be given with advantage every three hours, the dose being from one drop upward, according to the age. It is only in the most extreme cases, when there is much pain, that opium should be given, and even then it should be in very small doses. If counter-irritants are to be had recourse to, which is doubtful, the most suitable are mustard poultices, or the spirit of camphor sprinkled on spongiopiline, and closely applied over the stomach. The diet should be light and nourishing as soon as the little patient shows any inclination for food. If stimulants are required, the best is a drop or two of brandy in a teaspoonful of milk, or a little port wine diluted with water.

Diseases from Insufficient Food.

Dr. Cornish, of India, observes, in a recent report to the English Government—

There are two varieties of starvation recognized by all physiologists and practical physicians. The "acute" form, in which all food is withheld, as in people shipwrecked at sea, or shut up in mines; and the "chronic" form, in which the daily nutriment necessary to the wants of the body is defective in quantity or quality. The "acute" form of starvation slays its units—the "chronic" form its tens of thousands. It is the latter form that we have to take notice of in seasons of dearth and food scarcity; but of late years a fashion has sprung up, of referring mortality that unquestionably ought to be shown under the head of "privation" or "starvation," as due to disease, and in this way attention is diverted from the real fount and origin of excessive death rates.

When the food supplies of a people are insufficient to sustain life, and all the tissues of the body have wasted, the mortality occurs mainly as a result of the feeble powers of assimilating food. After the victims of chronic starvation get into jail there is no lack of suitable and nourishing food; and if the issue of nutriment to persons in an advanced stage of chronic starvation can save life, there should be no famine mortality in jails. But experience, whether in jails or famine relief camps, tells precisely the same story, viz.: that there is a stage in the downward progress of those whose food has been habitually insufficient, from which recovery is impossible. When the powers of digestion and assimilation are impaired, diarrhœa, dysentery and dropsies set in, the symptoms of which are unrelievable by food or medicine, and death follows. The diseases resulting directly from privation have killed, in jails, more than three times the number that were cut off by cholera or other epidemic pestilence.

Treatment of Pneumonia.

Dr. S. Benton, of London, writes to the *Lancet*, September 6th—

Acute sthenic pneumonia is ushered in with one single rigor, and runs a definite course of seven days; if you can keep your patient alive until the eighth day, the prognosis is favorable. Several shivering fits are not an unusual precursor in catarrhal or broncho-pneumonia, in pneumopleuritis, and pneumonia with other complications; also these forms of the disease run a longer and different course to simple acute pneumonia.

A lowering treatment does not suit pneumonia. I have had lately under my care a large number of acute cases of pneumonia of both lungs, one of my patients being over eighty years of age. The treatment adopted, and which has proved successful, is to order them a mixture containing liquor ammoniæ acetatis and vinum ipecac. for the first two days, with a slop nourishing diet; the local measures being turpentine stupes or jacket linseed-meal poultices during this the period of engorgement.

On the third day order three ounces of brandy; on the fourth, fifth, and sixth days steadily increase the stimulant, giving it in milk and egg; also order a draught containing two grains of quinine, to be taken every four hours. Envelop the chest in cotton-wool, which is both beneficial and comforting to the patient. The quantity of stimulant ordered must be regulated in accordance with the previous habits of your patient; begin with small quantities, increasing the dose steadily up to the seventh day. Be careful strictly to watch over the nurse; everything depends upon her. If she neglects his nourishment during the nights of the sixth and seventh days of the disease, the patient is bound to slip through your fingers, especially if previously addicted to intemperance.

Reviews and Book Notices.

NOTES ON CURRENT MEDICAL LITERATURE.

——A paper of considerable local interest, entitled, "The Sanitary Problems of Chicago, Past and Present," appears in pamphlet form. Its author is Dr. J. H. Rauch, of Chicago.

——A historical sketch of the physicians of Dover, N. H., read before the New Hampshire Medical Society, by Dr. John R. Ham, reviews the profession in that town from 1631 to 1878. It is full of facts.

——A reprint of an article by Dr. Douglas Graham, of Boston, contains a historical sketch of massage, tracing it from the *anatripsis* of Father Hippocrates down to the *lomi lomi* of the Sandwich Islanders.

——A valuable paper, embodying much original observation, on the staining and double staining of vegetable tissues, by Dr. J. T. Rothrock, appears in the *Botanical Gazette*, September, 1879.

——In an article on "Climato-therapy of Phthisis Pulmonalis," by Dr. John Brownrigg, of Columbus, Miss. (reprint from the State Trans.), the author compares Aiken, S. C., and various spots in Florida, with some celebrated resorts in the old world. As usual, the climatic conditions are stated very incompletely, and the author at the close of his paper evidently remains uncertain as to the relative merits of the localities he discusses.

——The Annual Report of the Board of Health of the City of Pittsburgh is a well prepared document of 86 pages, with maps and colored diagrams. A feature of particular interest is a report on the outbreak of diphtheria in the city, from August 1877 to August 1879, by Dr. W. Snively. The total deaths from that disease alone in those two years were very nearly one thousand (984)! Dr. Snively considers it unquestionable that imperfect drainage and the poisonous effects of sewer gas were the main factors in the separate outbreaks he chronicles.

——The first number of the *Real Encyclopädie der Gesammten Heilkunde*, edited by Dr. Albert Eulenberg, and published by Urban & Schwarzenberg, Vienna, has reached us. The subjects are arranged in alphabetical order, and in this number extend from *Aachen* to *Accommodation*. The editor is assisted by a long list of collaborators, including many of the most distinguished names in German medicine. The work is handsomely illustrated with numerous wood cuts, and will represent the most scientific phases of modern medicine. It will be completed in about ten volumes.

——Dr. Martinez del Rio, of the City of Mexico, is an experienced obstetrican, and in a half dozen papers which he has written the reader in that department will find much to interest him. One is of a remarkable case of vaginal atresia following gangrenous inflammation at the first labor. In spite of the impossibility of intromission the patient conceived again, and section of the vagina was performed at the second labor. It was successful, and resulted in a cure of the atresia. Other of his subjects are *La raspa de la cavidad uterina, extirpacion del cuello uterino por medio del cauterio actual*, and *Higiene puerperal*.

BOOK NOTICES.

A Clinical Treatise on the Diseases of the Nervous System. By M. Rosenthal, vol. II. Translated by L. Putzel, M.D. New York, Wm. Wood & Co.

On a previous occasion we have noticed the first volume of Rosenthal's work. The present one embraces anterior scleroses, hysteria and its concomitant nervous disorders, spasmodic cerebral and spinal neuroses, toxic neuroses, those associated with tremor and those connected with the sexual system, diseases of the cranial and spinal nerves, and vaso-motor and trophic neuroses. The translation is well made, and except that the advances in neurology which have been made in the last few years do not appear in the text with the prominence we have a right to expect, the work is one which the neurologist will scan with interest.

Transactions of the Southern Illinois Medical Association. Vol. I. 1879. pp. 71.

This Association was formed January, 1875, and is now stated to be "one of the largest and most harmonious bodies of medical men west of the Alleghany mountains." This first vol. of its transactions contains the minutes, an address by the retiring President, Dr. D. S. Booth, on the contagiousness of consumption, and articles on chloral, by Dr. D. H. McCord; epilepsy, by Dr. H. R. Guthrie; insanity, by Dr. J. K. Rainey; antiseptic surgery, by Dr. H. D. Hammack; and cases reported by Dr. J. G. Arnett, H. V. Ferrell, J. T. Binkley and others. The volume presents a very creditable appearance, and its contents well merit presentation in permanent form.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Half-Yearly Compendium of Med. Science,	2.50
Reporter and Compendium, - - -	7.00
Physician's Daily Pocket Record, - -	1.50
Reporter and Pocket Record, - - -	6.25
Reporter, Comp. and Pocket Record, - -	8.25

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,
115 South Seventh Street,
PHILADELPHIA, PA.

LEPROSY IN AMERICA, ITS DANGERS AND PREVENTION.

The introduction and possible spread of leprosy in America has excited the attention of the profession to some extent during the past year. There are several foci on this continent whence it may be propagated and where it already exists. Beginning at the north, there is no doubt that true leprosy has existed for generations among certain villages on the coast of New Brunswick; within the last year thirteen cases have been reported from Louisiana, by Dr. L. F. SALOMON; it has been introduced into California by Mongol emigrants; and in the island of Trindad, in a population of 120,000, there were, in 1878, 860 lepers. Dr. ROHE, in the Maryland *Medical Journal*, July 1878, estimates that at that time fifty cases of true leprosy had been observed and recorded in the United States.

The horror which this disease inspires arises from several causes: its loathsome aspect, its incurability, its foul odor, its alleged contagiousness. Its exact pathology is still undetermined, and even the apparently easily ascertainable fact of its communicability remains a debated question. Dr. ROHE is of the opinion that it is not a specific, pathologically definite disease, depending upon a known cause, but that it consists in a profound disturbance of the economy, analogous to, or more properly homologous with, cancer, beginning perhaps in the nervous system, occurring in all parts of the earth, and affecting individuals of all classes; the origin and nature of which remain for the present unsolved problems.

Dr. JOHN C. BERRY, who spent five years as medical missionary in Japan, concluded, from his observation of the disease as it exists there, that it is limited in its power, and cannot propagate itself beyond five generations, if due attention is given to the care of its victims; and further, that under certain conditions of soil and climate, combined with whatever tends to depress the vital powers, either morally or physically, it is endemic; and these latter influences play an important part in the early production of the disease in those who inherit a tendency to it. While doubting its contagious character, he believes that the evidence is ample, that it may be propagated, like syphilis, by inoculation.

The latest study of this important question of its communicability, is by Dr. W. MUNN, whose article appeared in some recent numbers of the Edinburgh *Medical Journal*. He believes there are sufficient proofs of its semi-contagious character, and states them briefly in the following propositions, which he supports by abundant evidence:—

"1. It has always spread from race to race, wherever an infected race was brought into contact, under favorable conditions, with a non-infected one.

"2. It has been and is most prevalent among those races and nations among whom the freest communication with lepers is allowed by public opinion and law.

"3. The so-called proofs of heredity commonly advanced being utterly defective, most, if not all, of the cases accepted by some authors as hereditary are best accounted for by communicability.

"4. The cases on record of probably communicated leprosy strongly support this view, and taken with the other proofs, show that the disease is undoubtedly communicable, probably only by long continual contact or inoculation, but possibly through drinking water."

A work has been published this year, by Balliere & Son, Paris, by a missionary to Trinidad, who presses very urgently the view that the disease is really contagious, in the full meaning of the term. He recognizes that it is a widespread opinion of medical observers that such is not the case, but he shows that the disease does extend, and always has extended, in a community, just in proportion as the leprous have been allowed free intercourse with the uncontaminated around them. In regard to the element of contagion, the active agent in communicating the disease, our author believes that infection takes place mainly through the agency of the respiratory passages, and asserts that the well pronounced leper exhales an odor which marks his presence, and which not infrequently leads to his discovery, and often humiliation, as in traveling in public conveyances. He says that frequently priests, in the confessional, in administering extreme unction, etc., are profoundly affected by the effluvia coming from leper patients.

The prevalence of this disease in India, where 75,000 lepers are estimated to be living, in China and Japan, the intercourse with which countries is growing yearly, in the Sandwich Islands, where a severe form is common, and in the localities mentioned in our own country, give to the study of its nature a new and appalling interest. It has been stated that it is essentially a disease of insufficient nutrition, and that a well fed race could not suffer much from it; but this is more than doubtful, and the experience of modern times coincides with that of that ancient lawgiver, "learned in all the wisdom of the Egyptians," who ruled that absolute isolation of the affected is the only safeguard to a community when this dreaded malady once shows itself, and who in the Pentateuch has left us a monument full of information and sound advice on this, as on so many other subjects which most intimately concern the destiny of man. It may be long before we in the United States shall have occasion to resort to this terrible measure; but it may be near; and in any case we should be clearly aware of our duty in the premises.

Notes and Comments.

Therapeutical Notes.

INFLAMMATION OF THE EYES.

℞.	Morph. sulph.,	gr. iij	
	Zinci sulph.,	gr. ij	
	Aq. dest.,	℥ j.	M.

Sig.—Apply two drops directly to the eye every three hours.

Of the above Dr. J. E. Horn says, in the Cincinnati *Lancet and Clinic*—

I have used this prescription a number of times in acute and subacute inflammations of the eye, and always with good success. I have used many others, but not with so great a degree of success. In fact, I have never used a remedy that gave me so great satisfaction, unless it be quinine in affections of a malarial origin.

ERGOTINE IN PROLAPSUS ANI.

Dr. Vidal recommends injection of a solution of ergotine for this purpose. The *Paris Médical* mentions three cases in which this method was employed. In one of these the prolapse, which had existed for eight years, yielded to the treatment in three months. In two other instances the cure was much more rapid. A woman under observation at the St. Louis has been almost entirely cured by three injections. The contractions produced by the introduction of ergotine extend, as a rule, to the bladder, and give rise to spasm and dysuria.

CHLORATE OF POTASH IN EPITHELIOMA.

A writer in the *Lancet* says: In epithelioma a *saturated* solution of chlorate of potash forms an excellent application. This was first recommended by Ledeschi, in 1845, and has since been experimented with by Bergeron, Le Blanc, Blondeau, Féréol and others. Miton and Cooke published the first two cases of cure by this means in man; there is, therefore, nothing new in the treatment, but I wish to insist upon the fact that it is serviceable. A few weeks since Professor Broca showed me a patient with an epithelial growth surrounding and involving both lips, which had been modified most satisfactorily by saturated chlorate of potash solution dressings.

PRESCRIPTION FOR SPERMATORRHŒA.

The New York correspondent of the Chicago *Medical Journal and Examiner* sends to that journal the following prescription for spermatorrhœa:—

℞.	Tr. humuli	40	c.c.	
	Tr. camph.	30	c.c.	
	Tr. opii.	10	c.c.	
	Syr. tolu, q. s. ad.	100	c.c.	M.

Sig.—4. c.c. at night.

Of this he says: It was given me by Dr. W. C. W. Glazier, Assistant Surgeon Marine Hospital Service, and has had much endorsement, some of it very strong and rather amusing.

KINATE OF QUININE, HYPODERMICALLY.

For hypodermic use, Mr. Collier, of Guy's Hospital, recommends—

℞.	Quiniæ kinatis,	℥ vj	
	Aquæ destil.,	℥ ij.	M.

Heat until the salt dissolves, then fill up with water to f. ℥ j.

This solution is perfectly neutral, but requires attention, that the kinate does not become precipitated. It is soluble, and by heating will readily redissolve.

Quinine in Delirium Tremens.

The value of very full doses of quinine in those cases of delirium tremens where the vigilance continues in spite of large doses of anodynes, is well illustrated in a case reported by Dr. E. F. Waller to the Louisville *Medical News*. The patient had taken *twenty-four* grains of morphia, besides large quantities of chloral and bromide of potash, but the vigilance and delirium continued. It was at this critical stage of the trouble that Dr. Waller recalled to memory the recent reports of the sedative effects in typhoid fever of large doses of the sulphate of quinia. He accordingly gave the patient forty grains, with capsicum added, and left him in my care. Soon his manner began to change, and at one o'clock (three hours after the first dose was given) he repeated the quinia, and in less than fifty minutes the patient was sleeping. He slept six and one-half hours, waked, resumed his sleep the next afternoon, slept well the following night, and regained his former mental balance.

Digitalis in Typhoid Fever.

Some praise of this treatment is awarded by Dr. W. T. Chandler, in the *American Medical Biweekly*, August 30th. He observes—

"There is a remedial agent that is sometimes of signal service in the treatment of typhoid fever; I allude to the *digitalis purpura*, the physiological effects of which have been rendered famous by the original experiments of Fothergill. The action of digitalis is to decrease the frequency of the heart beat at the same time that it augments the power of the cardiac systole. It is only indicated when the heart's action is feeble and frequent. It may be given either in infusion or fluid extract; the dose to be regulated by the effects in individual cases, to be determined alone by its influence over cardiac action. The late Dr. E. T. Easley, in an essay upon the use of "Digitalis in the weak heart of continued fever," speaks advisedly as to its efficacy in the later stages of typhoid fever, in controlling irregular and enfeebled action of the heart."

The Development of Ergot.

At the last meeting of the British Pharmaceutical Conference, Mr. W. W. Stoddard detailed some novel observations on ergot in the rye grass, *Lolium pratense*. It was first brought to notice by the fungus affecting ewes and lambs which fed upon it.

The deductions from this investigation were—

1. That for medical purposes and for pharmaceutical preparations in the greatest activity ergot ought to be collected in the months of August and September.

2. That ergot attains its greatest intensity at the close of the "vegetable" growth of the fungus.

3. That the medicinal properties of the ergot lessen and begin to disappear as soon as the fructifying period commences.

4. That the growth of the fungus on the *Lolium* appears to be identical, both microscopically and chemically, with that of the rye itself.

Analysis of Chlorine.

Scheele, the discoverer of chlorine, supposed it was a compound body, and only when all attempts failed to decompose it, was it placed among the elementary bodies. Recently Prof. Victor Meyer, of Zurich, has succeeded in separating it into other constituents. He uses an extremely high temperature, 1570° Cent. and the manipulations necessary to testing under these conditions are as yet so imperfect that he has not been able to say whether the resultant is oxygen or some other element. He submitted to the same temperature oxygen, sulphur and quicksilver, but they underwent no alteration. Iodine behaved like chlorine, showing itself to be a compound body.

Nervous Symptoms of Uterine Disease.

An interesting illustration of the close etiological relationship which sometimes—more frequently, perhaps, than is usually remembered—exists between uterine and nervous disease, was lately brought before the Chicago Medical Society. Dr. Bartlett related a case of Dr. Mary Thompson's. A woman suffering from cervical

laceration became the subject of epileptic seizures, and finally had in one day six or eight of these attacks. The Doctor operated in the usual way, and the patient had now had but one fit in three months.

Simaruba Bean as an Antiperiodic.

A French physician, Dr. Coignard, who practiced in Costa Rica, reports that the natives use the bean of the *simaruba ferruginea* as an antiperiodic, cutting the bean into small pieces, the size of a pea, which the patient swallows between the attacks (*Allg. Med. Cent. Zeitung*, August 27th).

The bark of the simaruba, which is officinal in the United States Dispensatory, is a simple bitter tonic, and quassia, which is derived from another tree of the same species, also possesses no specific properties.

Correspondence.

Case of Dropsy.

Ed. Med. and Surg. Reporter:—

I have a case on hand which I wish to report in your journal, for two reasons: first, the repeated aspirations or "tappings;" and secondly, the immense quantity of water drawn by the above means within a specified time, the patient during the principal part of the time able to sit up, walk about the house; and also occasionally visit and attend church. My friend, Dr. Garretson, of Macomb, used the trocar and canula at seven successive sittings, averaging once in three weeks, at each operation taking from 4 to 4½ gallons. The lady then came to me for assistance, and during the year I "tapped" her fifteen times, averaging 4½ to 5 gallons. The year referred to expired January 31st, 1879. At that time the wound made by the trocar remained *pervious;* and since that time the patient has been her own surgeon, and once in eight days' time draws regularly about 2 gallons of water, introducing the canula through the wound remaining open.

We have kept a correct account of water drawn since commencement, making two hundred and nine (209) gallons, having been operated upon twenty-two different times, and the remaining portion drawn by herself. We make no addition for the spontaneous escape of water from the wound during the twenty-four hours following an operation, an amount sufficient to saturate a large comfort during one night, supposed by the patient to amount to 1½ to 2 gallons succeeding each sitting.

The patient's age is about 52; she has been married 15 years; never borne children. The origin of her dropsy is *renal*. The operations were begun March or April, 1878, and the last one, January 31st, 1879.

She is still living; able to sit and walk around the yard and house; but the anasarca, which previous to the present fall season has only shown in her feet and legs, is now becoming general. Have *tried* many remedies, but none appeared to have a beneficial effect.

Any suggestion by your readers will be thankfully received. J. W. Donnally, M.D.

Doddsville, Ill., Oct. 9th, 1879.

Three Cases of Diabetes.

Ed. Med. and Surg. Reporter:—

I was called, September 12th, 1876, to P. P., aged eighty-two, of very intemperate habits, who was suffering from diabetes insipidus. He was very much emaciated, appetite ravenous and with a constant thirst. He passed from sixteen to twenty pints of water in twenty-four hours. He had been treated by several physicians, but had received no benefit. I put him on the following, which entirely cured him in fourteen days, and with tonic bitters he fully regained his former health:—

℞.	Tinct. ferri sesquichlor.,	℥ ij
	Tinct. opii,	℥ iss
	Quiniæ sulph.,	gr. x
	Aquæ puræ,	℥ vj. M.

Sig.—One ounce three times a day.

Case 2.—I was called, September 21st, 1877, to see H. J. B., aged fifty-five; blacksmith; also of intemperate habits. He was suffering at that time with typho-malarial fever, which lasted twenty-two days, and resulted in a tedious recovery.

After he had apparently recovered, and resumed his work, he was soon forced to discontinue, from having so many calls to urinate. Some one told him he had diabetes, that it was incurable, and the old man concluded to have nothing done. He was passing from twenty-two to twenty-four pints of water a day and night. His friends finally prevailed upon him to try medical treatment, and I was sent for. I put him on the above ferruginous mixture, and the improvement was such that he was able to be on the streets in fourteen days. He complained of the bitter in the medicine, and I put him on the tinct. ferri chloride, in one-half drachm doses, and he was entirely restored in two weeks more, and is now a hale old man, and working at his trade.

Case 3.—D. G., aged forty-five; tinner; habits intemperate; called on me in June, 1878. Complained of an aching pain in the region of the left kidney, and said he would have to quit his work if he could not be cured, as he had to lose so much time to make water. I tested his urine, and found it to contain from one to two and a quarter ounces of saccharine matter. I ordered the same treatment as in Case 1, and he was so much relieved that he continued his work. The quantity of water has remained normal since the first two weeks of abatement, and as he seems in good health, I have not examined the urine since. To-day I inquired of him if he had remained well, and he says his urine is normal, except when he takes cold, then it increases in quantity, but a few doses of the medicine fully restores him to his normal standard of health.

Marion, Ill. W. H. Bently, M.D.

On Cholera Infantum.

ED. MED. AND SURG. REPORTER:—

At the commencement of my professional career, twelve years ago, I lost in rapid succession several cases of cholera infantum treated according to the methods indicated in the standard medical works of that time. Soon after I saw, in some medical work published in New York city, the histories of ten or twelve cases treated successfully with small doses of bromide of potassium. I immediately began its use, and in conjunction with subnitrate of bismuth and rigid dietary regulations nearly every case since coming under my care has terminated in recovery. The subnitrate is given every three hours, in doses of five to fifteen grains, and the following formula of the bromide is used:—

℞. Potassii bromidi, gr. xvj
Aquæ destillatæ, unciam,

SIG.—Coch. min. quaque hora sinnen deun.

If the child has not been weaned, the diet of the mother is carefully regulated. She is restricted to toasted bread, a little milk or egg, with tea and coffee, if the latter are habitual.

The flour of which the bread is made is inspected, that it may be known to be good. The child is allowed to nurse only once in three hours, and the amount is diminished. Idiosyncrasies, if any, of the child are detected. Thus in one case a mouthful of chicken taken by the mother, in another two teaspoonfuls of milk from a certain cow, used in tea, acted as a cathartic upon their respective infants. The mother is directed to obtain at least eight hours' sleep daily, and to effect this the child during that time is committed to the care of a nurse. Of course, the mother is roused to nourish the child, but this being performed she is again permitted to sleep. If the infant has been weaned it is confined to cow's milk diluted with rice-water, varying the proportions according to circumstances.

The milk, if possible, is given while it yet contains the animal heat, and, of course, is milked from the cow as required. The cow now occupying the office of mother must be in good health, should be in a stable perfectly clean and ventilated, furnished with abundance of food and pure water, and in no way irritated. Rigid adherence to the above plan, modified more or less by circumstances, has, as above stated, been uniformly successful for the past ten years, and being so long continued cannot be attributed to good fortune, neither to climate, as it has been equally successful in New England, Virginia and Kansas. The disease I understand to be cholera infantum is described by Austin Flint as follows: "A child is seized with vomiting and purging, the latter usually occurring first; the acts of vomiting and purging are violent and frequently repeated; after the contents of the stomach and bowels are expelled the evacuations consist of secreted or transuded liquid, in more or less abundance. * * * If the course be unfavorable the vomiting and purging continue; the child is tormented with thirst, but everything is rejected from the stomach; great prostration ensues, collapse follows, and death takes place in one, two or three days. In some cases the attack eventuates in a chronic affection, accompanied by diarrhœa and occasional vomiting."

The etiology of the disease I believe to be improper food prior to dentition, with heat as the lesser factor. To feed an infant solid food before it has teeth with which to masticate is a violation of a law of nature, and will be surely punished, and if the penalty fell upon the parents only it would be well. To test this matter, let any number of infants be confined strictly to the breast, and the diet of the mothers carefully regulated. Let an equal number be reared in the ordinary way, viz., nursed some, fed, now bread, now pickles, with an occasional piece of salt pork, etc. I should expect the cases of cholera infantum to all occur in the latter class. Three children of my own have passed from the period of birth until after dentition with no other nourishment than breast milk, the eruption of the teeth causing no more disturbance than the growth of the finger nails, and at no time was there a symptom of cholera infantum. A portion of the infancy of one was during a Kansas drouth, the temperature being most of the time at about 110°. An experiment of this kind, to be of value, should undoubtedly be of much greater extent. It is difficult, however, to find mothers who will not feed more or less.

W. T. DONNELL, M.D.

Stockton, Rooks Co., Kansas.

Effects of Cold Enemata.

ED. MED. AND SURG. REPORTER:—

I was very much interested in reading the article headed "The Anti-febrile Effects of Cold Enemata," in a recent number of the MEDICAL AND SURGICAL REPORTER. I have been using *cold* water clysters pretty extensively, in some forms of disease, the past year, with excellent results, and perhaps my limited experience and observation may benefit others.

In a country practice we cannot take accurate observations as readily as they can in hospitals, still we can see the benefits and results just as well, though not so accurately.

Last July I had a severe case of remittent fever, with bilious diarrhœa; I prescribed the usual treatment in such cases, but ordered a cold water clyster, about six ounces, after each discharge, or every two or three hours.

On my next visit the patient informed me the cold clyster arrested the diarrhœa, but he had the clyster continued; he said it had such a nice, cooling effect, and kept him from drinking so much water.

My next case was diarrhœa, in a patient who had typhoid fever. In this case I prescribed four ounces cold water, sulph. zinc, gr. five, tr. opii. ℥ ss, to be used every four to six hours. This injection not only controlled the diarrhœa, but the opium had a better effect upon the general system than if taken by the mouth.

I would further say that, as a general rule, any medicine per enema has a speedier effect upon the system than when given by the mouth, but the rule is to give just double the quantity.

During last July and August eight or ten cases of dysentery came under my treatment, mostly

all adults, and nearly all were severe cases. Three of the cases were taken rather suddenly, and very severe, passing blood in the discharges freely, and each one informed me on my first visit they could not live unless relieved. In addition to the usual treatment in such cases, I ordered six ounces of cold water clyster after each discharge. But every six or eight hours I would add hydrate of chloral, half a drachm to the clyster, to subdue the pain and tenesmus, which would give the patient a few hours' rest and sleep. Sometimes I would alternate with fluid extract of hyoscyamus, half a drachm.

I do not like opium in any form in dysentery, as it has a tendency to arrest the secretions, while the above will not, and yet give the desired rest. In some cases, if I wanted to give immediate relief of pain and tenesmus. I would use hypodermic injection of cold water in the arm, which would invariably give immediate and prompt relief.

In all those cases I would use the cold clyster throughout the disease until cured, and some of the patients would inform me that the cold water thus used was what cured them.

From my observation and experience I deduce the following facts :—

1. Cold water clyster assists to cure.
2. It is cooling and refreshing to the patient.
3. Where there is much febrile excitement it lowers the temperature.
4. It also acts as a sedative to the circulation of the blood and allays thirst.
5. It also acts as a tonic and stimulant to the rectum and colon.

In conclusion, I would not willingly undertake a severe case of dysentery or diarrhœa in typhoid fever without the use of cold water clysters. A fair trial will demonstrate its good effects.

JOHN A. HENNING, M.D.

Red Key, Jay Co., Ind., Sept. 16th, 1879.

NEWS AND MISCELLANY.

Statistics of Age.

From some statistics collected in a Berlin paper, as to the duration of life, and especially as regards the proportion of the population which reaches an extreme old age, it appears that, for its population, Greece possesses the greatest number of very old people (ninety years and upward), albeit it is one of those countries where, on the whole, old people (sixty years and upward) are relatively few. France takes the lead with respect to old people generally, but it has the small proportion 0.04 of the very old. Germany and Spain show the smallest number (0.03 and 0.02) of the very old people. Austria-Hungary is something better. There are no statistical data of sufficient accuracy for the Russian Empire, but M. Leroy-Beaulieu is of opinion that the number of persons in Russia who are sixty years old and upward is about forty-five in every thousand. Omitting Russia, Turkey, and some other small States, there are about 18,000,000 persons in Europe of the age of sixty and upward.

Personal.

—Dr. Rosa Welt, a young lady of Vienna, has been appointed assistant to the chair of Ophthalmology in Bern.

—Dr. Seth Williams, of Portland, Maine, died recently, of heart disease. He was a young and promising member of the profession.

—Dr. James C. Copland, author of the abridged edition of Copland's *Medical Dictionary*, died recently. He was a literary man of extensive erudition.

—The death of Mr. Pye Henry Chavasse is announced. He was born in 1810, and spent his professional life in Birmingham. His name is associated with various popular medical works, dealing with maternal cares and duties, numerous editions of which have been published in England and this country, and whose usefulness is furthermore exemplified by their translation into nearly every European language and also into several of the languages of Asia. For some time the exact nature of the disease under which he labored was obscure, but the symptoms pointed toward cerebro-spinal sclerosis, and a post-mortem examination revealed the existence of that lesion.

The Cholera in Japan.

Within the last two years there have occurred over 100,000 cases of cholera in Japan, with a mortality of about 50 per cent. Dr. D. B. Simmons, of Yokohama, writes of the epidemic—

"The type of the disease is rather peculiar, so that some foreign physicians denied for some time that it was cholera. Vomiting and rice-water evacuations were not seen in more than half the cases, if in so many; the stools were often yellow, or green and slimy. I have seen a large number of cases, but most of them have passed into the stage of collapse. The diarrhœa in the fatal cases is not often severe, but suppression of urine comes on early, followed by death in from eight to twenty-fours. I have used jaborandi and pilocarpin in many cases, and have brought on the secretion of urine frequently when the cases were not too far advanced. The reaction, when produced by these drugs, seemed less likely to be followed by secondary fever than when stimulants were used."

The Yellow Fever.

The continued mild weather in October was favorable to the persistence of the fever. From six to twelve new cases daily have been reported from Memphis, with a high mortality. There is serious talk of abandoning the city and choosing another site five miles distant. A number of cases have occurred at Hopefield, opposite Memphis, and at Centerville, La., up to the middle of the month there had been reported sixteen cases, with six deaths.

—Ten persons died in a small village near Breslau, in July, from eating poisonous mushrooms.

Items.

—A cremation society has been organized at Rome.

—The German physicians are complaining, like ourselves, of the abuse of clinics and dispensaries by well-to-do people. A Berlin medical paper says it is no uncommon thing to see patients well dressed, with gold chains and watches, among the applicants for gratuitous medical attention at these charities.

—A Doctor at Hot Springs, Ark., who insisted on employing drummers to get him patients, contrary to an act now in force there, has set forth his woes in a petition to the Circuit Court there. The richest part of the petition reads as follows:—

"That this course of the defendant and its officers is designed to paralyze, and will paralyze, if continued, all enterprise and competition in the practice of medicine."

—Berlin papers report two curious cases operated on recently at Langenbeck's clinic. One was the removal of a phosphatic calculus which almost filled the bladder and weighed nearly 20 oz. (600 grams). The other, still more singular, was the removal of a third ear, which grew from the cheek of a boy just in front of one of his proper ones. It was well formed, but was, of course, unconnected with any auditory apparatus.

—The Boston *Medical and Surgical Journal*, October 9th, says: "We regret to be obliged to announce that at a meeting of the councillors, held on October 1st, it was voted to admit women to the Massachusetts Medical Society. The report of the committee to whom was intrusted the investigation of this question was unfavorable to their admission as members, but a minority report was offered and substituted for it." We doubt if the regret will be generally shared by the profession.

OBITUARY NOTICES.

Dr. F. J. Le Moyne

Died at Washington, Pa., in his 82d year, last week, and in compliance with his request and directions in his will, his body was consumed in the crematory furnace he erected several years ago. He was the first to introduce this method of disposing of corpses in the United States, and his own was the third cremated in this country. Dr. Le Moyne was of French birth, and of strong sympathies with advanced thought. Previous to the war he was a warm abolitionist and an earnest member of the Presbyterian church, but when many members of that faith declared that the Bible sanctioned slavery, Dr. Le Moyne said if that was the case their religion was false, and withdrew from the church. Later in life he became greatly interested in the doctrines of the Theosophists. His fortune is estimated at about $300,000, and he provides in his will that all bequests are void unless the heirs assent to the cremation of his body. This was punctually carried out on October 16th, the time required to incinerate the remains being six hours. The brain weighed only 43 ounces, about six and a half less than the average. Two of his children are said to have withheld their assent to the rite, one of them a physician, who had already incurred his father's displeasure by declining to cremate the body of his child. The funeral services were conducted by the Rev. Dr. Hays, President of Washington and Jefferson College.

—Dr. Eugene Peugnet, of Fordham, N. Y., was struck by a locomotive, on the New York and Harlem railroad, last week, at West Mount Vernon, and had both his feet cut off. Both legs had to be amputated below the knees. He died four hours after the operation had been performed.

—Dr. J. S. Garretson, an old resident of Bridgeton, was found dead in his bed, at his boarding house, in that city, on October 15th. He was 78 years of age, and the cause of his death was general debility.

—Dr. William H. Wilbur, a leading physician of Westerly, R. I., died suddenly, of heart disease, last week. He was Surgeon in the late war, in the First Rhode Island Cavalry.

QUERIES AND REPLIES.

Dr. R. F. C., of Texas.—For the treatment of small subcutaneous nævi, tattooing the surface with croton oil has been recommended by Dr. De Smet, of Brussels. The details of his process are given in Napheys' *Surgical Therapeutics*, page 253.

Dr. L. B. T., of O.—If you address Dr. Douglas Graham, Boston, Mass., he will give you full information on the treatment of *massage*.

Dr. S. K., of Miss..—Yes; if you will send us botanical specimens of the plant we will have it identified for you. We are always glad to aid researches into the indigenous medical botany of our country, and will cheerfully and without cost have any plants alleged to possess medical virtues correctly identified.

Sigma.—Pilocarpin has been used with some success in albuminuria; but in that attending pregnancy it is hazardous, from its ecbolic properties.

Purchaser.—Your letter was referred to the proprietor.

MARRIAGES.

HILDENBRAND—BACHMANN.—On Tuesday, Oct. 7th, 1879, at the residence of the bride's parents, 1326 North Sixth street, by Rev. A. Richler, Dr. Louis Wm. Hildenbrand and Miss Mary E. Backmann, all of this city.

TAYLOR—DRAYTON.—In Philadelphia, at St. Stephen's Church, on Wednesday, October 15th, by the Rev. John K. Louis, U.S.N., John Madison Taylor, M.D., and Emily, daughter of the late Henry E. Drayton.

DEATHS.

SABINE.—In New York City, suddenly, on Saturday, October 4th, Julia Hannah, wife of Dr. G. A. Sabine.

SILL.—On October 1st, 1878, Dr. Andrew Sill, of Livonia, N. Y., aged 75 years.

TIBBALS.—In Cincinnati, Ohio, on Monday evening, September 29th, Dr. William F. Tibbals, aged 36 years.

HORSFORD'S
Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges

MANUFACTURED BY THE

RUMFORD CHEMICAL WORKS,

1155-1206 **PROVIDENCE, R. I.**

DE DUDLEY'S EMULSION DE
OF PURE
NORWEGIAN COD LIVER OIL
PANCREATINE
AND
DE LACTO-PHOSPHATE OF LIME DE

FORMULA.—Each fl. oz. contains six grs. of Pancreatine, sixteen grs. of Lacto-Phosphate of Lime, twenty-five per cent. of Glycerine, and **fifty** per cent. of Norwegian Cod-liver Oil.

THE ONLY PANCREATIC EMULSION MADE IN THE UNITED STATES.

This preparation is respectfully submitted to physicians as being **always** reliable. Although well aware that Cod-liver Oil Emulsions have fallen into deserved disrepute, yet we are confident this will stand any test or trial it may be subjected to. It contains no GUM ARABIC, TRAGACANTH, ALBUMEN, SACCHARINE OR ALKALINE MATTER; therefore, it will not SAPONIFY, FERMENT nor RANCIDIFY. The addition of **Pancreatine** insures rapid and complete assimilation, enabling patients with very weak stomachs to easily retain and digest it.

Guaranteed to keep in any climate. Physicians supplied with samples (express paid) on application.

DUDLEY & CO., Pharmaceutical Chemists,

Laboratory, 397 and 399 Pearl Street. **423 Fulton Street, Brooklyn, N. Y.**

MESSRS. DUDLEY & CO.: *Dear Sirs*—Though your EMULSION has not been before the profession a long time still I have used it quite extensively in my practice, and can truly say I think it one of the most elegant preparations of Cod-liver Oil I have ever prescribed. I find it can be readily taken and borne by the most delicate stomach, and the PANCREATINE and PHOSPHATES make its administration desirable in a large number of cases other than phthisical. In fact, there are few cases of mal-assimilation and general debility in which its administration will not do good; and it gives me pleasure to recommend it to my professional brethren.

179- HOMER L. BARTLETT, M.D., Brooklyn, N. Y., Consulting Surgeon Kings County Hospital.

NEW REMEDIES.

FLUID EXTRACTS.

Coto Bark.—From BOLIVIA. Almost a specific in acute and chronic diarrhœa, cholera, cholera morbus, etc.

Cascara Sagrada.—(**Rhamnus Purshiana.**) From the PACIFIC SLOPE. A certain remedy for habitual constipation; and very useful in all cases where a laxative or cathartic is indicated. Beware of the fluid extracts of spurious varieties of this bark.

Folia Carobæ.—From BRAZIL. A powerful alterative, which exerts a marked curative action in syphilis, scrofula and kindred disorders.

Rhus Aromatica.—A remedy in diabetes, and other diseases of the genito-urinary organs.

Damiana.—(**Turnera Aphrodisiaca.**) From MEXICO. The best known aphrodisiac. Of great value in impotence, spermatorrhœa, and loss of sexual appetite.

Boldo.—(**Peumus Boldo.**) From CHILI. The new tonic. Very useful in dyspepsia, hepatic torpor, yellow fever, etc.

Berberis Aquifolium.—From CALIFORNIA. Has marked alterative and tonic powers, and has been used with extraordinary success in salt rheum, psoriasis, eczema, scrofula and syphilis.

Black Haw.—(**Viburnum Prunifolium.**) From the UNITED STATES. Employed to prevent abortion and miscarriage.

Grindelia Robusta.—From CALIFORNIA. A valuable curative agent in asthma and diseases of the air passages.

Grindelia Squarrosa.—From CALIFORNIA. Anti-malarial. Used in enlarged spleen and other malarial diseases.

Cereus Bonplandii.—(**Cereus Grandiflorus and Cereus McDonaldii.**) From MEXICO. Heart sedatives. Very useful in controlling functional and organic disturbances of the heart.

Kaki.—(**Diospyros Kaki.**) From JAPAN. Peculiar action on the mucous surfaces. Useful in mucous dyspepsia, typhoid fever, etc.

Cercis Canadensis.—Indigenous. A positive remedy in chronic diarrhœa, dysentery, etc.

Jaborandi (diaphoretic). **Guarana** (sick headache). **Fucus Vesiculosus** (anti-fat).
Bearsfoot (enlarged spleen). **Coca** (nervous stimulant). **Kava Kava** (Gonorrhœa).
Eucalyptus Globulus (antiseptic and anti-malarial). **Yerba Santa** (coughs).
Yerba Reuma (catarrh). **Wood Betony** (dyspepsia). **Ustilago Maidis** (oxytocic).
Penthorum Sedoides (catarrh). **Soap Tree Bark** (tooth wash).

CRUDE DRUGS.

Goa Powder (ringworm and diseases of the skin). **Gurjun Balsam** (a substitute for Copaiba).
Alstonia Constricta (a substitute for Calisaya).

SUGAR-COATED GRANULES.

Calcium Sulphide 1-10 gr. (for the cure of boils and carbuncles).

Our limited space prevents our describing in detail the history and application of each remedy, but to those interested in NEW REMEDIES, we will say, that we can furnish interesting information relative to the above new drugs.

PARKE, DAVIS & CO.,

DETROIT, - MICHIGAN.

Our New Remedies can be procured of the Drug Trade throughout the United States. By specifying **"P., D. & Co.'s"** in all cases, you will ensure reliable preparations of the **true drugs.**

WILLIAM B. ATKINSON, A.M., M.D.,

Lecturer on Diseases of Children, at the Jefferson Medical College; Physician to the Department of Obstetrics and Diseases of Women, Howard Hospital, Philad'a.

SECOND EDITION. ENTIRELY RE-WRITTEN AND ENLARGED. 12MO, CLOTH. PRICE, $1.00.

—o—

The very gratifying reception given this handbook of the essentials of the obstetrical art has led the author to submit it to a careful revision, and increase its size by adding a number of new topics.

It may safely be characterized as the most convenient, compact, reliable and handy *vade mecum* on obstetrics in the language; as the following personal and editorial statements sufficiently attest.

OPINIONS OF PHYSICIANS AND THE PRESS.

"It is really a '*multum in parvo*,' and will, I am sure, be of great service to multitudes in the profession who have hitherto followed the routine of old traditions."—*Prof. Fordyce Barker.*

"It is as good for the old as for the young practitioner."—*Dr. J. Marion Sims.*

"It abounds in extremely valuable hints, and is calculated to do much good."—*Prof. Goodell.*

"Founded upon the personal experience of the author, it must prove of value to the very wide circle of the profession who will oe led to purchase it by their acquaintance with the author and his reputation."—(Philadelphia) *Medical Times.*

WYETH'S
DIALYSED IRON.

(FERRUM DIALYSATUM.)

A Pure Neutral Solution of Peroxide of Iron in the Colloid Form. The Result of Endosmosis and Diffusion with Distilled Water.

PREPARED SOLELY BY

JOHN WYETH & BRO.,

PHILADELPHIA.

This article possesses great advantages over every other ferruginous preparation heretofore introduced, as it is a solution of iron in as nearly as possible the form in which it exists in the blood. It is a preparation of invariable strength and purity, obtained by a process of dialysation, the iron being separated from its combinations by endosmosis, according to the law of diffusion of liquids. It has no styptic taste, does not blacken the teeth, disturb the stomach, or constipate the bowels.

It affords, therefore, the *very best* mode of administering

IRON

in cases where the use of this remedy is indicated.

The advantages claimed for this form of Iron are due to the absence of free acid, which is dependent upon the perfect dialysation of the solution. The samples of German, French and American Liquor Ferri Oxidi Dialys. which we have examined give acid reaction to test paper. If the dialysation is continued sufficiently long, it should be tasteless and neutral.

Our dialysed Iron is not a saline compound, and is easily distinguished from Salts of Iron, by not giving rise to a blood-red color on the addition of an Alkaline Sulpho-Cyanide, or a blue precipitate with Ferro-Cyanide of Potassium. It does not become cloudy when boiled. When agitated with one part of Alcohol and two parts of Ether (fortior), the Ether layer is not made yellow.

Physicians and Apothecaries will appreciate how important is the fact that, as an antidote for Poisoning by Arsenic, Dialysed Iron is quite as efficient as the Hydrated Sesquioxide (hitherto the best remedy known in such cases), and has the grea advantage of being always ready for immediate use. It will now doubtless be found in every drug store, to supply such an emergency.

Full directions accompany each bottle.

Physicians will find our DIALYSED IRON in all the leading drug stores in the United States and Canada.

It is put up in bottles retailing for **ONE DOLLAR,** containing sufficient for four months' treatment. Large size is intended for hospitals and dispensing. Retail at $1.50. Price Lists, etc., sent on application.

RELAPSE IN TYPHOID FEVER.

Delivered at the Philadelphia Hospital, Sept. 4th, 1879,

BY WILLIAM PEPPER, M.D.,

Of Philadelphia.

REPORTED FOR THE MED. AND SURG. REPORTER.

Gentlemen:—The man before you to-day presents rather an interesting phase of typhoid fever. He is a colored man, twenty-four years old. Four weeks ago he was attacked with the ordinary prodromus of a continued fever—lassitude, aching in the bones, weakness and fever, associated with the peculiar symptoms of typhoid fever, looseness of the bowels, loss of appetite and bleeding at the nose. He was seen by a physician in the city, and his disease pronounced typhoid fever. He was sent here after the disease had lasted about twenty-five days, and was then probably near the close of the attack. When first seen after his admission he had a temperature of 105°, which was probably due in large part to improper exposure and effort, and which, within thirty-six hours, ran down to 100°. We, of course, cannot determine the presence or absence of rose-colored spots, on account of the color of the skin; but whenever we find a patient with considerable continued fever and looseness of the bowels, it should always awaken a strong suspicion of typhoid fever. We have hardly any other continued fever of marked severity, and with marked prostration, in which looseness of the bowels is present. In simple continued fever we usually have constipation, and in all other continued fevers constipation is the rule. We look, in typhoid fever, for a certain course in the range of temperature, but in this case we cannot get at this. We then look for special symptoms occuring in typhoid fever—bronchial irritation and bleeding from the nose. This man has no bronchial symptoms, but he has had epistaxis. This man has had, then, without doubt, typhoid fever. A classical case of typhoid fever lasts about twenty-eight days, but many cases terminate in twenty-one days, with rapid cleaning of the tongue, reduction of pulse rate and temperature, and return of appetite. In a few cases typhoid fever terminates earlier than three weeks. You will meet with cases in which all the phenomena of typhoid fever have been well marked, that terminate as early as the seventeenth or eighteenth day.

When our patient was admitted, he was, by a mistake in the admission card, sent to the out ward instead of the hospital, and allowed to walk about for one day. He was found by the resident physician with a high temperature and looseness of bowels, and was immediately sent to the hospital. Since then his temperature, which for several days was moderately low, has rapidly increased, and last night it reached 104°. This patient has a relapse of his fever. Relapses in typhoid fever are so common that it behooves us to study them carefully. A patient may have been doing well; may have advanced several days, or even a week or two, in convalescence; then he becomes less well and a relapse sets in. You are, in these cases, to carefully study the case, in order to determine whether the patient is suffering from a relapse of his fever or from one of the sequelæ of typhoid fever. There is no disease in which there are more sequelæ than in typhoid fever.

Thus you have marked irritation of the nervous system, irritation of the bronchial and gastro-intestinal mucous membranes. I have seen ulcers on the tongue, mouth and fauces, in this disease, but they usually affect the lower part of the ileum. We have the mesenteric glands enlarged and inflamed. We find that, owing to the continued high temperature, the muscles undergo degeneration, particularly the muscles of the abdomen and of the heart. We may have, in consequence of one of these tissues becoming more irritated than usual, a complication or a sequel developed in the course of the attack. You should be constantly on the lookout for the development of these complications.

Insanity and dementia are not very rare sequelæ, resulting from the prolonged irritation and malnutrition of the nervous system. We have various forms of paralysis, from trouble in the spinal cord. Inflammation of the bronchial mucous membrane and parenchyma of the lung, ulceration of the small and large intestine, inflammation of the veins, phlegmasia alba dolens, obstruction of the femoral vein, inflammation of the periosteum, and necrosis of the bones. All these are among the sequelæ of typhoid fever.

When a patient has been doing well and the temperature going down, and we notice that the man is getting a little dull, the tongue coating and the temperature mounting up again, we may be sure that some mischief is going on. The man is about to have a return of his fever or develop one of the sequelæ. We have to decide this point in connection with our patient. This man has an accelerated pulse, a tongue foul and coated, and a return of hebetude. He may have any of the sequelæ we have mentioned. His pulse is 96 per minute; not immoderately fast. He has no cardiac murmur. He has no cough. There is perfect resonance over the whole lung, back and front. There is no pain on deep inspiration. There are no râles. We can therefore exclude pleurisy and pneumonia. There is no disease of the heart or lungs. There is no trouble with this man's bowels; they are, as yet, quiet. There is no marked degree of tympanites; the bowel is a little distended and is resonant throughout. Let me, in passing, urge you, if you are disposed to try to develop gurgling in the iliac fossa, that you will not push your finger through the ulcers in the intestine. Even if you do develop gurgling, it is worth nothing, for it is present in other diseases and also in health. The injury that may be inflicted upon the bowel by the examination is incalculable. If you do search for gurgling, do it by uniform pressure, and not by thrusting the finger into the iliac fossa.

I press upon the calf of this man's leg, but it causes no pain. In phlegmasia, one of the earliest symptoms is extreme tenderness of the calf of the leg upon pressure. This pain is due to the compression of the inflamed popliteal vein against the bone. This symptom will appear before you can detect any hardness of the vein or any swelling of the leg. There is no trace of phlegmasia here. There is no evidence of any local lesion in this case.

Typhoid fever does truly relapse. After a patient has gone through the whole course of an attack of typhoid fever, the disease may begin again and the patient have a second attack. I have seen two, and even three, relapses, in which the characteristic symptoms reappeared and ran through their entire course—the eruption, delirium, fever and purging, all appearing. These relapses do not last as long as the primary attack. They usually run their course in two or three weeks. You will find that the temperature rises more rapidly and does not present the ordinary changes met with in the primary attack. You are apt to find, in these relapses, one set of symptoms more prominent than the rest; according to my experience it is the abdominal symptoms that are usually most prominent. I explain this upon the fact that the typhoid poison causes inflammation and ulceration of Peyer's glands and of the mesenteric glands, and upon this local disease depends many of the symptoms of typhoid fever.

I believe that the eruption is owing to the ulcers in the intestine; that upon irritation of the vaso-motor nerve connected with the inflamed coat of the intestine, a reflex action is sent through the vaso-motor nerve connected with a small area of the skin, causing the congestion which we call rose-colored spots. It has been noticed that as typhoid fever passes through its course there will be repeated crops of these eruptions, and I think it is probable that these eruptions correspond to ulceration in different groups of glands. All the glands do not ulcerate at the same time, but they break into ulceration in successive crops. As each crop of ulcers form we have an exacerbation of the symptoms. Take, for instance, a patient at the close of three weeks in typhoid fever; we will find some glands ulcerated, and some only inflamed, and which may not pass on to ulceration, under proper care; but let the patient be exposed to cold, to some indiscretion in eating; the glands which are inflamed, weak, and disposed to break down, hurry

forward to ulceration, and all the symptoms of the previous attack reappear. These relapses, then, are, in my opinion, very often connected with renewed ulceration. I have seen perforation and death occur in a third relapse of typhoid fever, and the ulcers found high in the ileum, while those near the valve were almost healed.

After having excluded all local disease, we arrive at the diagnosis of a relapse, and we place the patient upon the treatment suitable for typhoid fever. We place the patient at absolute rest, and reduce his temperature as much as possible, by sponging him with cool water every three or four hours, according to the violence of the fever. We will keep him in a cool part of the ward, with plenty of ventilation. He will have an absolutely liquid diet. Considering that he is now in the beginning of the fifth week of his sickness, we will allow him more stimulants than we otherwise would—from four to six ounces of sherry; or if his strength begins to fail we will substitute brandy. He is also taking a moderate amount of oil of turpentine, five drops every three hours. This, with twelve grains of quinia during twenty-four hours, will constitute the treatment. We shall watch the progress of this case with interest.

Communications.

YERBA SANTA—OBSERVATIONS ON ITS THERAPEUTIC VALUE IN THE TREATMENT OF CATARRHAL AFFECTIONS OF THE UPPER AIR PASSAGES.

BY DR. J. C. WILSON,

Physician to the Philadelphia Hospital and to the Hospital of the Jefferson College.

The daily increasing number of new remedies, the persistency with which they are forced upon the attention of the profession, the value of some of them, as established by the concurrent testimony of numerous observers, and the absolute worthlessness of others, either in the diseases for the cure of which they are vaunted, or for any other purpose, warrant the publication, indeed, demand the publication, of the results of systematic studies of their properties, whether conducted at the bedside or in the laboratory.

During the winter of 1878–9 I prescribed Yerba Santa very frequently in catarrhal affections of the air passages, both in hospital and in private practice. The somewhat preposterous claims made for it by some who have made it the subject of communications to the journals were not realized, but its use was attended with such satisfactory results in a large number of instances, that I have come to look upon it as a remedy of great value.

Yerba Santa, *eriodyction glutinosum*, is described as a freely branching evergreen shrub, from three to six feet in height, inhabiting the mountainous districts of the Pacific slope. The leaves are petiolate, finely serrated and oblong; their upper surface is smooth and glistening, and of a rich, deep green color. It is thickly varnished with a resinous principle. The under surface is of a silvery gray. The leaves alone are used in the preparation as a medicine. This plant is said to be held in high favor as a domestic remedy among the country people of California, both Spanish and English-speaking. The former know it by the name which heads this paper; the latter call it "gum-weed" and "mountain balsam."

The remedial virtues of the plant are contained in the gum-resin which is abundantly yielded by the leaves.

It is sold in the shops in the form of a fluid extract, the taste of which is aromatic, sweetish, *intense*, and somewhat acrid. The acridity makes it disagreeable to take, and is not wholly done away with by combination with mucilage, syrups or glycerine. The dose of the fluid extract is from ♏xv to f. ʒj.

To obviate the difficulty of administration it occurred to me that it might be well given in the form of a pill. I accordingly, in November, 1878, suggested to Messrs. Blair the plan of evaporating the fluid extract to a consistency suitable for this purpose. This was found to be quite practicable, and I have since that date habitually prescribed the drug in pill form whenever possible. For those patients who are unable to swallow pills I have ordered a palatable but less efficient elixir, prepared by Metcalf & Co., of Boston. The inspissated extract has been found in all respects equal to the fluid extract, from which it is prepared.

Careful evaporation of the fluid extracts supplied by a number of manufacturers yielded an amount of solid residuum varying from 92 to 210 grains to the fluid ounce. The dose of the solid extract has usually been from three to nine grains, three or four times a day. Owing to the large proportion of gum it contains Yerba Santa is highly demulcent. It is at the same time slightly astringent; while it exerts a special action upon the mucous membranes of the upper air passages, which may be described, for want of better terms, as tonic and sedative, I have found it most useful in subacute inflammatory conditions of this tract.

In subacute laryngitis the action of this remedy has in a number of instances been extremely prompt. Patients who had suffered from previous attacks have testified enthusiastically to its efficiency. The relief of the sense of dryness in the throat, the tickling, the irritative cough, has been speedy, and the further use of the drug has speedily brought about the full restoration of the voice.

In subacute bronchitis its use is no less satisfactory. No remedy or course of treatment has seemed so useful to me in our common "winter colds," in persons otherwise healthy. That it is an expectorant, in the sense of increasing the bronchial secretion, my experience does not enable me to affirm, but of its power to favorably modify that secretion with great promptness, in the class of cases under consideration, I have had abundant clinical evidence; and it is through the change in the secretion, in part, and in part, perhaps, by reason of some sedative property of the drug, that the cough quickly yields under its influence.

There is another form of bronchitis, a form difficult to treat satisfactorily, and common in this climate, in which Yerba Santa is of great use. I mean the winter rheum of old people. It occurs in elderly persons of feeble constitution, and is quite different from the bronchial catarrh of the gouty. In this last, as well as in cases of asthma associated with chronic bronchitis and pulmonary emphysema, I have fouud it useless, alike in the attacks and in the intervals between them. In combination with opium and belladonna, its use has seemed advantageous in the cough of advanced phthisis. I have not used it in the earlier stages of that malady.

Its action upon the laryngeal and bronchial mucous membrane suggests its employment in some of the forms of nasal catarrh. I have not had the opportunity to verify the claims set forth for it in the treatment of these affections.

It was administered to a number of individuals affected with influenza, during the mild epidemic which prevailed during the early months of last winter. General treatment was also employed. It appeared to me that Yerba Santa had in these cases very little influence either upon the course of the disease or upon the intensity of the symptoms.

In acute inflammations of the air passages, such as are attended by pyrexia and by a good deal of constitutional disturbance, Yerba Santa is not indicated.

It has an undoubted diuretic effect. Patients in all cases report that the flow of urine has increased while they took this medicine. I have made no observations upon the influence of Yerba Santa upon other mucous membranes. It is said to be of service in the treatment of hemorrhoids, both locally applied and internally administered.

Yerba Santa given in the form of pills does not interfere with the appetite or digestion, possessing in this respect a decided advantage over most of the drugs that are in common use in the treatment of the affections in which it is indicated.

I have preferred to submit to the reader the above summary of my observations, rather than to attempt to reproduce the cases—not in themselves otherwise of especial interest—from which the conclusions have been derived; or to illustrate the value of the remedy in tables of figures and percentages, which could not fail to convey fallacious conclusions, because of the dissimilarity of cases of those lighter maladies, and our inability to represent numerically important factors in the problem which each patient presents. My object in preparing this brief paper will have been gained if a remedy of no mean value is thus brought to the notice of some who, among the multitude of new drugs, have overlooked it.

1437 *Walnut street, Philadelphia.*

CHOLERA INFANTUM.

BY HORATIO R. BIGELOW, M.D.,
Of Washington, D. C.

From the monthly exhibit of "births, marriages and deaths," issued by the Health Officer and Registrar of the District of Columbia, we extract the following: In June the reported deaths from *cholera infantum* were 74; of these 23 were white males, and 23 white females; 12 were colored males, and 16 colored females. Sixty-four were under 1 year in age; ten were from 1 to 5. During the same month the deaths from diarrhœal diseases were 55; of this number 18 were white males, and 14 white females; 12 were colored males, and 11 colored females. Thirty-seven were under 1 year in age; five from 1 year to 5 years; one from 5 to 10 years; one from 10 to 20 years; four from 20 to 40 years; six from 60 to 80 years; and one was over 80 years. The highest temperature attained during the month was 95°, the lowest was 51°, range 44°. The greatest daily range of temperature was 28°, on the 9th and 14th insts. The least daily range was 6°, on the 3d inst. The mean of maximum temperatures was 83.3°, and the mean of minimum temperatures 63°. The

mean daily range of temperature was 20.3. The monthly range of the barometer was 0.778. In July there were reported 74 deaths from cholera infantum, 21 being white males, and 16 white females; 23 colored males, and 14 colored females. Of the whole number, fifty-seven were under 1 year of age, and seventeen were from 1 to 5 years. During this month there were 71 deaths from diarrhœal diseases; 14 being white males, and 21 white females; 23 colored males, and 13 colored females. Forty-four were under 1 year; nine from 1 to 5 years; one from 5 to 10 years; three from 20 to 40 years; four from 40 to 60 years; and ten from 60 to 80 years. The highest temperature was 102°, the lowest was 59°, range 43°. The greatest daily range of temperature was 28°, on the 14th and 15th insts. The least daily range of temperature was 6°, on the 30th inst. The mean of maximum temperatures was 88°, the mean of minimum temperatures was 68.5°, the mean daily range being 19.5. The monthly range of the barometer was 0.710. In August there were 29 deaths from cholera infantum, 8 of which were white males, and 11 white females; 6 were colored males, and 4 colored females. Twenty-one were under 1 year of age, and eight were from 1 to 5 years. From diarrhœal diseases there were 37 deaths, 6 being white males, and 6 white females; 13 were colored males, and 12 were colored females. Fourteen were under 1 year of age; twelve were from 1 to 5 years; one was from 20 to 40 years; six were from 40 to 60 years; three were from 60 to 80 years; and one was over 80 years. The highest temperature was 94°, on the 2d and 3d insts. The lowest temperature was 55°, on the 10th inst. Range 39°. The greatest daily range of temperature was 26°, on the 11th inst. The least daily range was 8°, on the 17th and 26th insts. The mean of maximum temperatures was 83.9°. The mean of minimum temperatures was 66.0°. The mean daily range of temperature was 17.9°. The monthly range of the barometer was 0.589. During the three months, June, July and August, the total number of deaths from cholera infantum was 177; and from diarrhœal diseases 163; 142 of those who died from cholera infantum were under 1 year of age. 95 of the deaths from diarrhœal diseases were of the same age, 1 year or under. Of deaths from cholera infantum, 52 were white males, and 50 were white females; 41 were colored males, and 34 were colored females. Of deaths from diarrhœal diseases, 38 were white males, and 41 were white females; 48 were colored males, and 36 were colored females.

From these statistics, and others of similar nature, it is manifest that the custom of the country is to class in the mortality returns, under the common head of Cholera Infantum, all the deaths from simple and inflammatory diarrhœa and entero-colitis; whereas the fact is, that Cholera Infantum is an exceedingly rare as well as fatal disease, occurring as an epidemic and rarely sporadically. Indeed, so rare is it, that I very much doubt if there were three cases of *genuine* cholera among the infants of Washington during the three summer months. This disease, which is identical with the follicular enteritis of Billard, with the apyretic and febrile follicular diacrises of Barrier, and with the choleriform gastro-intestinal catarrh of Rilliez and Barthez, is exceedingly rare in Europe, and for no assignable cause, except that a sharper distinction between it and inflammatory diarrhœa is made by practitioners on the Continent and in England. The mortality just cited is beyond precedent, following no known law, depending upon no known meterological changes.

It cannot for a moment be supposed that the deaths from Cholera Infantum, where no epidemic of cholera existed, exceeded all other deaths from diarrhœal diseases, or that the proportion in 1000 of population, for the month of July, should be 5.224. Evidently the true nature of the pathogeny of Cholera Infantum is not understood, or if it be, physicians are careless in the use of terms.

The anatomical lesions of entero-colitis, inflammatory diarrhœa and cholera infantum, are as different as are the symptoms and treatment. The consensus of medical opinion is tending to class Cholera Infantum as a disease of the great sympathetic and not primarily as a diarrhœa. The vaso-motor nerves being paralyzed, the mouths of the blood vessels nourishing the intestinal walls are open, and from them serum is constantly exuded. This exudation acting as a foreign body originates an intestinal catarrh, and it is this diseased condition which acts by contiguity of structure, and sometimes by actual contact, upon the sympathetic, producing collapse. Moreau's Experiments (*Comp. Rend. de l'Acad. des Sciences*, t. lxvj. p. 554, 1868) confirm this view.

There is an inherent predisposition to the disease among some children, and the more especially among negroes. This condition is intensified by the extraneous conditions of bad air, dentition, heat, insufficient nourishment and improper clothing. Undigested food, of itself alone, is incapable of originating the disease,

though this is a fruitful source of summer diarrhœas. It is more apt to manifest itself among the poor and ill fed, who dwell in crowded places, abounding in pestilential smells, where sewer gas penetrates into every chamber, and where rotting garbage is allowed to remain for days at a time at street corners and in alley ways. It always occurs between the ages of one and five years, because it is often coincident with dentition, this latter being a condition of nervous irritability.

The anatomical lesions of cholera infantum are peculiar. There is always proliferation and exfoliation of the cells of the mucous membrane; the muscular layer of the intestine loses its essential characteristics; Auerbach's plexus undergoes a kind of fatty degeneration; the chalice cells present large, gaping mouths; the blood vessels of the villi are increased in calibre; the mucous follicles and glands of Peyer are enlarged. In diarrhœas generally we find this enlargement of the mucous follicles and of Peyer's patches, together with an inflammation of the mucous membrane; but nothing more, the centres controlling the vaso-motor system being situate in the cerebro-spinal axis, and not in the sympathetic ganglia.

If the foregoing theory of the pathology of cholera infantum be true, our remedies should be cerebro-spinals; chalk mixture, rhubarb, and their congeners, are equally useless; and upon no possible ground can their use be defended. Carbolic acid may be given, to correct the nature of the evacuations, though it does not act as an astringent. Ergot, in combination with some one of its synergists is often very valuable. At first it may increase the amount and frequency of the discharges, and may occasion pain, but very soon its action in contracting the arterioles is manifested. It slows the heart's action, increases the blood pressure, and incites to action the muscular coat of the intestine. Strychnia may very properly be regarded as a synergist to ergot. It unquestionably exerts a great influence on the sympathetic, as it does also in lessening the calibre of the arterioles. Quinine, either alone, in *full* doses, or in combination with iron and strychnia, is a most valuable remedy. Blisters to the head and ice to the spine, together with the free use of a solution containing oil of anise, oil of cajuputi, and oil of juniper, equal parts, added to ether, sulphuric acid and tincture of cinnamon, are all applicable to promote reaction. Quinine in full doses, combined with ergot, should be given from the commencement of the disease. A spiced brandy poultice applied over the abdomen often affords relief. Digitalis is sometimes indicated, to promote the flow of urine. Hot brandy punches may be given from time to time. The best results may be obtained by careful attention to hygienic regulations. The diet should be non-farinaceous, and I have found that barley-water, or Horlich's food for infants, best answered this purpose. Good ventilation is an essential, and absolute rest in bed should be enjoined.

Hospital Reports.

GOOD SAMARITAN HOSPITAL, CINCINNATI, OHIO.

CLINIC OF JAMES T. WHITTAKER, M.D.,

Professor of Theory and Practice of Medicine in the Ohio Medical College.

REPORTED BY A. H. KELCH, M.D.

Hemiplegia, from Cerebral Hemorrhage.

GENTLEMEN:—I present to you to-day a case without a history. You will observe, from the condition of the patient, that we can get no response from her at all. But you may make a diagnosis from inspection alone. This woman was brought into the house about four days ago. Her condition at that time was more grave than now. As it is, the patient experiences no pain at all, although she suffers extreme distress. But the distress is altogether mental, and arises from emotional anxiety. You may, those of you who are at all familiar with the phenomena of disease, be able to make a diagnosis in this case, from inspection alone.

You will notice the difference in the two sides of the face, more particularly about the angles of the mouth and eyes, where the expression in general is most developed. The difference in the expression will depend somewhat, of course, upon the amount of expression with which the individual is naturally endowed. In some individuals there is naturally none, and there is every grade, up to great intelligence. You can mark some difference in the expression of the two sides in this case; not much about the forehead nor the eyes; more about the parts of the face moved by the buccinator muscle; more still in the lines of expression about the angle of the mouth. Here it is, indeed, that you notice the change much more distinctly, as a rule, than elsewhere, because, as you are aware, it is the feature of the most expression, naturally. It is upon the lines of expression about the angles of the mouth and the eyes that the artist expends the most of his time. If we can bring out some emotional disturbance in this case we shall see, as you now observe, the disparity much more pronounced. We do not notice in the neck any difference in the two sides, except that the head inclines toward the left side. If I now turn the head over to the right, as you see, it drifts back again to the left. When we come to look further along the body, we find differences in the hands. The hand on the left side is cramped. The skin looks as if it were lifted

somewhat from the subjacent tissue; moreover, it is more hyperæmic, and you notice upon it some marks. When I lift the right hand I experience a feeling of resistance and rigidity. You would naturally expect that when I lift it it would fall back, but it is comparatively rigid. You observe I can hardly straighten out the forearm. On the opposite side everything is entirely different; the muscles are perfectly resolved and flaccid.

If we continue our examinations to the lower extremities, we find about the same changes observed in the hands. The right foot is larger than the left. There is marked disparity between the size of the feet, because the left is œdematous, and anybody that will put his hands on the two feet will recognize the difference in temperature; one is hot, the other is cold. I get the same sense of rigidity in the right foot that that we had in the hand, though the opposition is not so marked. The disturbance of the sensation is everywhere profound. You see that flies crawl over the surface of the right side of the face without notice on the part of the patient. Here, too, is an eruption on the right side of the face, a copious, papular eruption. What is that? The simplest solution is the easiest. The papules are relics of unnoticed mosquito bites.

Now, what is the occasion of this paralysis? All that we know of the patient is, that she was a strong, hearty woman; she went to bed well, and woke up, if I may so speak, in this condition, a few mornings since. One who never studied medicine would know that this loss of sense and sensation and motion indicates disease of the brain, a disease whose effects extend *a capite ad calcem*, from the head to the feet We have here a case of paralysis of the whole right side, a hemiplegia, which, of course, means that the lesion is situated in the left side of the brain. But it does not indicate what kind of a lesion. We desire to know what kind of a lesion exists and what we can say of its future, even if we can do nothing for its relief. The simplest is the easiest solution. You would say this patient has had a hemorrhage into the left side of the brain, and is paralyzed as a result of the pressure of blood. But it would not be safe to jump at such a conclusion, for exactly such conditions may be produced by any cause that would interrupt the circulation of the blood through a great vessel in the brain. One of the large vessels sometimes becomes occluded by an embolus or a thrombus. The question is, have we to deal here with an embolus, a thrombus, or with a hemorrhage?

The patient knows nothing as yet; she woke up with an abolition of consciousness, if we can say such a thing, and more like a hemorrhage is this suddenness of attack. But suddenness does not necessarily mean hemorrhage, because a clot detached from the valves of the heart may almost immediately plug up one of these large vessels and produce the same results. But this patient shows no heart lesion that we can detect, nor any other source for an embolus. This patient, you will observe, is past the middle period of life. Here are evidences of age, in the gray color of her hair and in the folds of the skin, and in the majority of cases where hemorrhage takes place it is in people advanced in life. The degenerative changes that occur in the various tissues of the body as old age begins to creep upon the individual affect the blood vessels of the brain likewise, so that they become brittle and fragile. They break, and blood then pours out into the brain and rips up and mutilates its substance. Such accidents are not confined to the brain alone. The same thing sometimes occurs in the lungs, and especially in the spleen, and the term apoplexy has been improperly applied to these extravasations of blood. The term apoplexy simply means struck down. The brain is much more frequently affected by extravasations of blood than any other tissues, and we see how easily this may be explained by the condition of the brain substance. You know, if you hold a brain in your hand it flattens out; it has not so firm a consistence to support its vessels as even the spinal marrow, and in this fact we discover a reason why hemorrhage happens so much less frequently in the spinal cord. Then the canals in which the cerebral vessels run are very wide and loose. This stroke may be caused by anything that blocks up the blood in the brain or obstructs the circulation there. When a rupture does occur in a vessel, there may escape only blood sufficient to fill a space the size of a pin's head, and again there is sometimes a whole lake of it, tearing up the brain substance and filling up the ventricles. How shall we discover the cause for this hemorrhage? We look first for that disposition to hemorrhage that may be transmitted by heredity. This disposition may affect the patient on the part of the blood vessels or the nerves. We look for an inherent instability of nerve force, a condition strictly inherited and favoring spasmodic contractions and congestion. Much more frequently we see the vascular tone impaired by disease of an important organ, especially by the kidneys. Bright's disease is, sooner or later, always attended by changes in the blood vessels. In Bright's disease hypertrophy of the heart must supervene to force the blood current through the capillaries, deprived, by a blood poison or by nutritive change, of their natural tone. The urine in this case does not reveal the existence of Bright's disease.

We cannot tell anything about the gravity of the case from the amount of the hemorrhage. The prognosis is rather determined by the seat than the extent of the effusion. But no patient ever dies suddenly from brain disease. The sudden deaths of which we read are caused by heart disease, by sudden arrest of the pulsations. An individual must live some time, varying from half an hour to several days, in even the worst hemorrhage into the brain. A person may succumb to a hemorrhage when the quantity of blood thrown out occupies only a space the size of a pin's head, and another may recover from an effusion like a lake. The position of the hemorrhage is the point, not the amount. In early life the hemorrhage is generally meningeal; in later life it is cerebral. With every decade of life the danger of hemorrhage increases. But it would appear, from statistics, that after sixty years of age the tendency to apoplexy decreases; this decrease is only apparent, however, because few indeed survive that time to

be affected by apoplexy. Cerebral hemorrhage occurs in gradually increasing proportion up to sixty years of age.

Whenever an individual is stricken down with apoplexy, from whatever cause, there is sometimes some warning of the approaching calamity. Such premonitions did not occur in this case. There was no vomiting; no headache; no twitching of the face; no prodromata, that we know of, of any kind.

When cerebral hemorrhage occurs, the attack announces itself in one of two ways: In the one case the individual falls, like a statue falls; then there is a total abolition of sensation and consciousness; the patient lies in a state of profound stupor; the face is flushed; the heart throbs; the pulse bounds; respiration is stertorous; the conjunctiva is injected; the pupils, contracted or dilated, are insensible to light; this is the characteristic picture of an individual plunged into apoplexy. There is another picture, where the patient falls and becomes blanched; there is extreme pallor of the surface and profound collapse. Such patients sometimes speak, after recovery, of having been struck on the head from behind. The amount of blood poured out into the brain could not, by any means, by its loss to the general circulation, produce this extreme pallor. The pallor and collapse result from the shock to the nervous system.

What we want to know now is the future of this and like cases. Not every case is so grave as this. Upon what factors can we rest our prognosis? The first and most important factor is the duration of the coma. You are always anxiously inquired of, in these cases, as to when the patient will recover consciousness. The longer the patient lies comatose the less favorable is the chance for the recovery. When the individual lies comatose for twenty-four hours, there is strong probability that he will remain so until the close. Such a duration is, however, not the rule. The patient generally recovers some degree of consciousness. Then, when he partially recovers, some motion is observed. At first the individual suffers from complete paralysis, because complete relaxation of all the muscles has taken place. When the cloud of the first shock has passed, the field clears away, and we can see what is left. Now, then, we observe the hemiplegia.

There is another factor upon which we base the prognosis, and that is the record obtained by the thermometer. The patient has fallen senseless; if you now put the thermometer, not under the arm, nor in the mouth, but in the rectum, above the sphincter, you will observe that the temperature has fallen, it may be on account of the shock, down two degrees, or to 97 or 97½°. Now, the longer the temperature remains down the graver is the case, for blood is being continually poured out, in all probability, and the patient must almost inevitably succumb. The temperature commonly comes quickly back to the normal point, and remains stationary a few hours, to then begin to ascend. In a favorable case it will not run up to above 100°; if it run up to 105°, the patient will die. The sooner the record returns to about the normal temperature, the better the chances for recovery. So here we have evidence, most valuable evidence, offered to him who will read it, throughout the earliest and most anxious hours of the attack.

In this case we have another factor of great prognostic value, viz., this rigidity on the right side of the body. This is a sign unfavorable, not so far as life is concerned, but as regards the final restoration of the limb. This patient's life is, for the present, secure, but this rigidity, when it comes on so early, is usually followed by a secondary rigidity, which is lasting.

The patient has come up out of her comatose condition to some degree, but not fully and clearly. For two or three days after she came into the house she was continually moaning and crying. We do not look upon that as unfavorable, so far as life is concerned, but we do look upon it as unfavorable to the restoration of the mind. You would never say, when the patient has so recently come up out of the coma, that she must remain in this state forever, but when this stupefied, dazed condition lasts so long, the outlook for the state of the mind is unfavorable. Fortunately, all apoplectic strokes are not so grave as this; indeed, instances have been cited where individuals have recovered from such shocks with better brains than ever before. There was the great lexicographer, Samuel Johnson, who wrote the finest work of his life after an aphasic hemiplegia. But these are exceptional cases. The patients, however, in a majority of instances, recover some intelligence, to then gradually drift off into imbecility.

And now the question comes up as to the recovery of the use of the arm and leg. You will notice that not all the muscles of the side of the face are paralyzed. You may take the most absolute case of hemiplegia, and the whole face is seldom absolutely paralyzed. Indeed, the prognosis is better, in simple facial paralysis, when all the muscles of the face are paralyzed, for that means a peripheral paralysis, a paralysis caused, for instance, by the action of cold upon the ends of the nerves in the muscles, causing them to fail to transmit the nervous stimulus. In this case you will notice that the occipito-frontalis is not paralyzed at all; neither are the muscles about the eyelids, as the lines about their angles indicate their play. Here are paralyzed simply the muscles about the angle of the mouth and those of the cheek. As a result of this paralysis of the cheek the patient is sometimes compelled to take the fingers and lift the food out from between it and the teeth, in order to prevent its undergoing decomposition there. The neck is not paralyzed at all; the arm is always paralyzed more or less completely, and also the leg, but not to the same degree. But here are the muscles of the neck, ribs and abdomen scarcely affected at all. How will we account for their exemption? Well, we look at the distribution of the nerves to these parts. We observe that the arm and leg can be moved independent of each other. The arms are independent absolutely, though the legs are mostly moved in concert. But the eyes move together. What does that mean? Why, of course, there must be commissural fibres in the brain or spinal cord, in cases of concerted movement, and we will find those muscles that act in unison responding, be-

cause they still receive some nervous stimulus from the side of the brain not affected—receive it through the commissural fibres. The muscles of the eyes, ribs and abdomen move thus in unison in health, and in hemiplegia the affected side still receives nervous influence through the commissures from the side which still is sound. Thus the muscles of the arm and leg may be completely paralyzed, while those of the eye, etc., are not.

Now, I have said the hemorrhage may occur anywhere; at the cortex, at the base, or in the centre of the brain. Where did it occur in this case? If you see a patient with a great amount of emotional disturbance, you may infer that it has occurred in the medulla oblongata or the pons. But it is almost impossible, at first, to say what symptoms depend upon direct pressure and what upon indirect effects, as upon general disturbance of the circulation and shock. We would infer, from the complete paralysis in this case, that a large amount of blood has been poured out. The patient was in a comatose condition for a day or two after she was brought into the house. There has been no convulsive movements, no twitchings of muscles, no agitation of members. It does not look as if the meninges were affected in this case. It looks as if there had been a large hemorrhage into the substance of, or about the opto-striate bodies, the most frequent seat of hemorrhage in the brain. Other factors that speak for this localization are the very slight implication of the face and the very pronounced early rigidity of the arm and leg. At the same time it must be said that no one can absolutely and definitely localize a lesion in the brain in a perfectly recent case.

When this patient recovers, how much will she recover, and what muscles will recover first? Those which suffer least recover first and most. She will recover the use of her leg to a great degree before that of her arm at all, and why? Because the leg receives more nerve force by commissural fibres from the other side. Long after she will be able to go about the arm may still swing helpless at her side. But she may never recover perfect use of her leg. It will long be swung into place, in walking, rather than be lifted and pushed in advance. We come to the muscles of expression last, and as a rule, they recover last.

Now, so far as the life of the patient is concerned, there is little danger, except from repeated hemorrhage. This blood clot will be, in a large degree, absorbed, and the pressure thus relieved. A scar may be found in this brain by some future observer, but the permanent damage that may be left time, the great diagnosticator, can alone determine.

We should not dismiss this subject without at least mention of that variety of apoplexy in which a stroke occurs, and the patient gets up and goes about his business in a few hours, or even less. It was formerly thought that these cases were due to serum effused into the brain, but the conception is absurd. Such strokes are due to sudden spasmodic closure of the vessels. The arteries suffer sudden spasmodic contraction, shut down upon, in this way, and cut off, the circulation. The flow of fresh blood must be continuous through the brain, or its functions are suspended. Now, it sometimes happens that a sudden discharge of nerve force, like a discharge from a Leyden jar, runs down upon the cerebral vaso-motor nerves, and the patient falls with apoplexy. These are the cases more especially of inherent instability of the nervous system, a fault in the original construction of the individual, as determined by heredity.

Medical Societies.

THE INTERNATIONAL MEDICAL CONGRESS.

The Congress met at Amsterdam, on September 7th, Professor Donders, of Utrecht, President, in the chair.

Prof. Donders' Address

turned largely on the relations of psychical phenomena to physiology, and on the doctrine of evolution. Of the former he said—

Let us enter deeply into the question. Given a thorough knowledge of the atoms, their number, relation to each other, movements—and I do not think this at all inaccessible—the psychical phenomenon, viz., consciousness, appears, without the aid of any intermediate agency, as a phenomenon *sui generis*, which is not contained either in matter or in movement. In short, it is a phenomenon that can only reveal itself to itself; in short, an inexplicable and unexplained phenomenon. What have we gained by attributing a psychical element to the atoms? The psychical element of the atom remains to us just as little known as the psychical element of the complex matter. In order to explain or understand a phenomenon, we must be able either to connect it with other well known phenomena, or to trace it back to some notion which can be grasped by our intellect, such as the notion of matter and movement, which are contained in the idea of space. To embrace the theory of monism because we fail to grasp the relations of the psychical phenomena, is merely an act of faith.

In regard to evolution, he said—

If the evolution theory rely on morphology for support, physiology alone is able to penetrate into the conditions of development, and to explain, from the causal point of view, those three great factors of harmonious evolution; viz., habit, exercise and heredity, and the tendency to variation which seems to spring from them. Every organ and every function becomes the object of questions on origin and development, and we are justified in expecting from physiology that it will realize more and more that it is its duty to elucidate them.

On this ground the doctrine of evolution and of psychical processes meet. From the point of view of the former the origin of our notions appears under a new aspect. The possibility has vanished that, at the time of creation, they were implanted into each species; and it is our duty to explain their origin. This explanation can only be found in experiments on the senses and the voluntary movements. Concerning the abstract ideas and the mathematical axioms, the

greatest mathematical thinkers of our time have attributed to them an empiric origin. It remains now for us to determine how much can be attributed to individual experiences and to race, of the origin of our notions. This is a serious question, which I have considered more than once in the course of thirty years, but of which I will not speak here. It suffices to recall that, in order to explain the origin of our thoughts, we are obliged to admit the combined action of our individual experience and of that of our ancestors, as it has been transmitted to us by heredity in the peculiar dispositions of our brain. Even in man, individual experience does not suffice to explain the development of ideas as we see it after the human being has been born.

Prof. Chauveau, of Lyons, read on infectious diseases, which was followed by a paper on

Bright's Disease,

by Prof. Rosenstein, of Leyden. His conclusions were—

1. The anatomical changes in the kidneys, which form the foundation of the disease that was first described by Bright, affect both the parenchyma and the connective tissue of the kidneys. 2. There cannot be properly said to exist strictly parenchymatous nephritis or strictly interstitial nephritis. It has been sufficiently demonstrated by experiments and clinical observation that in every case of diffuse inflammation of the kidneys, both histological elements are affected. 3. Diffuse inflammation always leads to certain pathological changes in this organ, known as white kidney and red granular kidney. Both may finally develop into the "atrophic kidney," the only difference being that in the former the parenchymatous tissue of the kidney is chiefly affected, and in the latter the interstitial tissue. Both varieties may be distinguished clinically by analyzing the urine. The symptoms of atrophy are common to both forms. 4. Clinical observations tend to show that the red granular kidney, or, as it is now called, primary cirrhosis of the kidneys, is preceded by a period of tumefaction. The assertion is confirmed by anatomo-pathological observations. 5. The description given by Bright relates principally to the white granular kidney. Here, as well as in the other variety, the morbid process passes through two stages, as has been shown both clinically and anatomically.

Dr. Chervin, of Paris, read

On Stammering,

Dwelling especially upon its causes and treatment. The majority of the theories broached as to its nature make it a spasmodic affection, involving all the lingual muscles, according to some; the genio-glossi only, according to others; others, again, referring it to spasm of the upper respiratory passages. These theories, based on no solid foundation, have led to disastrous surgical practice, *e.g.*, section of the base of the tongue, of the genio-glossi, of the hypoglossal nerve, removal of the tonsils, etc. The author considered stammering to be simply a want of coördination in the multiple acts necessary for speech. Methodical treatment, carried on for three weeks, is generally attended with success. For the first week the stammerer is forbidden to speak, except at definite times set apart for practice in reading and recitation. During the second week he is allowed to speak, but carefully watched, so that he is made to articulate every syllable slowly and distinctly. Then he is permitted to speak a little more rapidly, and at the end of the third week he is cured of his fault.

Mr. Marcowitz, of Bucharest, communicated the results of his observation on the

Treatment of Abdominal and Petechial Typhus by the Douche,

which he contrasted favorably, as regards its anti-pyrexial effects, with the cold bath. He believed that the shock of the douche was useful; that it acted in a reflex manner on the heat-regulating centres, upon which it seemed to have a stimulating effect, thereby continuing the good already obtained by the subtraction of heat. The only contra-indications to its use were those insisted on by Liebermeister as to the cold bath, viz.: intestinal hemorrhage, and a high degree of cardiac failure, as indicated by a small and feeble pulse. Pulmonary engorgement, save when it is due to cardiac weakness, is regarded as an indication for this measure, rather than the contrary.

In the Surgical Section, among other papers, M. Verneuil spoke on

Operations in the Subjects of Constitutional Disease.

His propositions were: 1st. Surgical operations are not positively contra-indicated in subjects attacked with constitutional disease, but they were often permissible, frequently useful, and occasionally indispensable. 2d. Their prognosis is always much more serious than in healthy subjects. 3d. Their prognosis varies, in the first place, according to the differences in constitutional disease, and for each of them considered separately, according as the diathesis belongs to a dyscrasic state, or as it is induced by lesions anatomically and chemically appreciable. 4th. Special medical treatment, directed to the constitutional disease, should be entered on during, after, or, if possible, before the surgical operation. 5th. A knowledge of the pathogeny, pathology, and the natural evolution and termination of constitutional diseases, not, perhaps, sufficiently possessed by surgeons, is of great importance. It serves to deter more than to incite to surgical measures, and increases confidence in the remedial efforts of nature, seconded by a comparatively mild therapeusis. 6th. Operations on such patients, although more generally palliative than curative, are, nevertheless, of great utility. In extreme cases they may prolong life, render it less painful, and for the patient, at least, they open the door of hope.

Professor Lister, who was much applauded, and received quite an ovation, spoke on the

Antiseptic Method,

chiefly with reference to the three following objections which had been raised to it. 1. Surgeons who disbelieve in the part played by germs have attacked the carbolic dressing on the ground of theory. If bacteria do not exist around wounds, or, at least, if they do not possess the

evil properties attributed to them, a dressing which aims at preventing the development of these bacteria has no *raison d'être*. 2. That the antiseptic dressing with carbolic acid is not free from dangers, and may produce poisoning. 3. That if good results are obtained by the Listerian method, the same results may be had by means of other modes of wound-dressing. To the first of these objections Mr. Lister replied shortly, that he believes in germs and their deadly *rôle*, but declined to enter into a theoretical discussion which would occupy so much time. To the second objection he admitted that in a certain number of cases he had observed symptoms due to carbolic acid poisoning, both local and general. Locally carbolic acid produces irritation of the wound. When absorbed it leads, in some patients, to loss of appetite, vomiting, general weakness; death had even been seen to be occasioned by it. But all these accidents are very rare, and, moreover, they may readily be prevented. He avoids local irritation by not washing the wounds, as many surgeons do. The general toxic effects are readily prevented by employing carbolic acid of good quality, and carefully watching the patients, so as to leave off the acid as soon as these symptoms appear. He had not had very good results from the use of boracic acid, thymol, and salicylic acid as substitutes for carbolic acid. On the third head Mr. Lister said that those who object to use the carbolic method because as good results are obtained by other modes of dressing, do not know what may be done by means of the former. The largest and deepest abscesses may be opened with impunity; large joints may be laid open, etc. He submitted for adoption by the Congress the proposition that the principle of antiseptic dressing is fully justified, and that the means which we have of realizing this dressing are quite sufficient.

Prof. W. P. Tilanus, of Amsterdam, read on

The Radical Treatment of Hernia.

The conclusions were as follows:—1. Very favorable results have been obtained by the radical treatment of hernia; viz., ligature of the neck of the sac, extirpation of the sac, suture of the opening, with antiseptic precautions. The treatment is not dangerous, and has in most cases given good results. 2. Operation for hernia is indicated only in cases where the hernia cannot be kept *in situ* by a truss.

In the Section on Obstetrics and Gynecology, of a number of papers read the following may be specified:—

On the Treatment of Uterine Fibromas,

by Dr. J. De La Faille (Leeuwarden). The following were the conclusions:—1. The treatment of uterine fibromata is principally determined by the hemorrhage. 2. The treatment must be modified with respect to the size and seat of the tumor. 3. Internal medication is seldom successful, though it may be tried in cases of intraparietal fibromata. The same may be said of alkaline baths. 4. A very rational treatment of intraparietal fibromata consists in subcutaneous injections of ergot. 5. The usual method of dilating the uterus, by means of sponge tents or laminaria tents, is dangerous. It is important that the tents should be frequently renewed. 6. Fibrous polypes ought always to be removed with the *écraseur*. 7. Intra-uterine fibromata are best removed by enucleation. The same may be said of the subperitoneal fibromata. 8. In cases of gastro-hysterotomy, the intraperitoneal treatment of the pedicle is preferable to the extraperitoneal treatment. 9. The extirpation of the uterus *in toto* is preferable to the partial excision of the organ. 10. Ovariotomy is very seldom indicated in fibrous tumors of the womb.

Prophylactic Treatment of Puerperal Fever,

by Professor Halbertsma (Utrecht). The conclusions were as follows:—1. The principal causes of puerperal fevers are—*a*. abnormal births; *b*. infection; *c*. atmospheric conditions. 2. The prophylactic treatment consists—*a*. in premature delivery before symptoms of endometritis set in; *b*. in not examining the woman *per vaginam* in cases of normal birth; *c*. in antiseptic treatment; *d*. in stimulating the contractions of the uterus after confinement by giving ergot. 3. The danger of contracting puerperal fever may be as great in private dwellings as in lying-in hospitals.

On the Effect of Pilocarpine, Eserine, Etc., on the Uterus,

by Dr. Van Der Mey (Amsterdam). The conclusions were these: 1. The subcutaneous or intravenous injection of a solution of hydrochlorate of pilocarpine made during pregnancy excites the uterus to contract. If the injection be given in the first stages of labor, it stimulates the uterine contractions. 2. The action of sulphate of eserine on the pregnant womb is very similar to that of hydrochlorate of pilocarpine. 3. It has been proved, by clinical experience and experiments on animals, that the action of hydrochlorate of pilocarpine in inducing premature labor has been much exaggerated. 4. If combined with the mechanical means for the induction of premature labor, pilocarpine may be found useful. 5. In cases of normal labor, where the uterine contractions are not strong enough, pilocarpine may be administered successfully. 6. It must not be used for the purpose of stopping *post-partum* hemorrhage.

The Sections of Physiology, Psychiatry, Pharmacology, and State Medicine, were well represented.

We close our abstracts with notices of a few of the more practically important papers from the Sections of Ophthalmology and Otology.

On Myotic and Mydriatic Agents,

by Prof. Doyer (Leiden). The following were the conclusions: 1. Notwithstanding the direct relation which exists between the size of the pupil and the power of accommodation, both functions are independent of each other. 2. It has been shown, by comparing the results obtained by different experiments, that the dilatatory effects of pilocarpine, eserine, gelsemine, atropine, elaturine, and duboisine, are in the proportion of $\frac{1}{200}$, $\frac{1}{8}$, $\frac{1}{16}$, 1, 2, 15. 3. The smallest dose of duboisine that has any effect upon the pupil is 0.000000005 gram.

On Antiseptic Dressing in Operations on the Eye,

by Professor H. Snellen (Utrecht). The following were the conclusions: 1. Suppuration following operations on the eye is an analogous process to suppurations after cutaneous operations. For this reason, antiseptic measures, which are modified according to circumstances, would have the same prophylactic importance. 2. No operation on the cornea ought to be undertaken without having previously thoroughly cleansed, with a one per cent. solution of carbolic acid, the part which is to be operated upon, as well as everything that can possibly come in contact with it. The instruments must be cleansed with alcohol. 3. As it is almost impossible to use Lister's spray in operations on the cornea, a current of air purified with carbolic acid may be substituted in its stead. 4. Rags dipped in purified vaseline and purified cotton wool will prove a sufficient dressing, both for antiseptic purposes, as well as to keep out the air. No irritating antiseptic means that might eventually increase the secretions of the conjunctiva and the glands of the eyelids must be employed.

On Sympathetic Irido-Choroiditis,

by Professor MacGillavry (Leyden). The following were the conclusions: 1. In ascribing the origin of sympathetic irido-choroiditis to an irritation of the ciliary nerves in the eye which is the seat of the primary affection, the hypothesis is implicitly admitted that inflammation may be caused by a reflex action. 2. This assertion, however, is not based on any facts in pathology which might lead to it. 3. It has been shown by anatomical observations that in sympathetic irido-choroiditis the lymphatic space between the dura mater and the arachnoids is filled with conglomerations of lymphoid cells. 4. We have reason to believe that these conglomerations take a part in causing the inflammation of the second eye.

On Adenoid Tumors in the Naso-pharyngeal Cavity,

by Professor Dayer (Leyden). The following were the conclusions: 1. Adenoid tumors in the naso-pharyngeal cavity give rise to a series of disturbances, the cause of which has frequently been misunderstood in the functions of respiration, speech and hearing. These troubles can only be cured in the majority of cases by removing the tumors. 2. Breathing through the mouth must not be considered merely as the effect of tumors or of a simple catarrhal swelling in the naso-pharyngeal cavity. When that habit has once been contracted, it becomes one of the principal causes of the further development or recurrence of the said tumors. 3. The best method of operating on adenoid tumors consists in crushing and removing them with the nails. This method is by far preferable to the use of instruments, and can be applied even in very young children.

On the Different Methods of Determining the Auditory Range,

by Dr. A. Magnus (Königsberg). The following were the conclusions: 1. In judging the usefulness of the methods by which the auditory range can be tested, the object of the test must always be kept in view, not an ideal object. No apparatus has as yet been invented that could be used for all tests. 2. As far as the auditory perception of irregular sounds (noises) is concerned, each ear may be tested individually. This would hardly be feasible for the regular waves of sound (music). 3. In making a medical diagnosis, such methods must be applied by means of which we can compare the auditory range for sounds that are transmitted through the air with that for sounds that are transmitted through the bones of the skull. 4. In order to enable the physician to make a prognosis and to control the treatment, he must use instruments which produce sounds of the same intensity (Politzer's apparatus, a watch). 5. A watch with an inhibitory apparatus would be the best instrument for a medical examination. 6. All the methods by means of which auditory range can be tested possess only a relative importance, owing to subjective influences (the degree of attention, age, intelligence), or to objective influences (any noise or sound which may exist during the examination, the locality, etc.). 7 Every physician must fix upon a normal distance for hearing, according to the circumstances under which he operates. If he regard this normal distance as a unity, he may express the results of his experiments as fractions of this unity.

On Diseases of the Ear in Relation to Life Policies,

by Dr. J. Patterson Cassells (Glasgow). The following were the conclusions: 1. It would be both arbitrary and unjust to look upon all cases of deafness and otorrhœa as being alike, and to refuse them. It has not at all been proved that diseases of the ear tend to shorten the medium duration of life in general. 2. All persons who wish to assure their lives must be questioned, especially as to the past and present state of their ears. 3. Persons who have been suffering from some disease of the ears, or are still so, must be examined by a specialist. 4. This is done with a view to estimate the danger which their life may incur through this affection. Accordingly, they must be classified as good, doubtful, dangerous, very dangerous. This classification will depend—(*a*) on the nature and the gravity of the affection; (*b*) on the present and past condition of their general constitution. 5. Persons suffering from some affections of the ear may be accepted, if their general health be good and free from all constitutional affection; also when there is no complication. All those must be refused where the otorrhœa is caused by an exanthematic fever, or if the persons be scrofulous or syphilitic; also all cases of singing in the ears, with or without deafness, where the gait is unsteady; lastly, all cases where the singing in the ears, whether accompanied by deafness or not, is complicated by a syphilitic constitution.

Drs. L. A. Sayre, of New York, Laurence Turnbull, of Philadelphia, and other Americans, were present, and were treated with great courtesy, the first named especially receiving marked attention.

Editorial Department.

Periscope.

The Value of the Hypophosphites in Phthisis.

Dr. J. G. S. Cogshill writes an article on this subject, in the *Lancet*, September 6th, giving his experience in 100 cases of phthisis. His formula was—

℞. Sodii. hypophosphitis,
Calcii. hypophosphitis, āā gr. viij
Infusi. cascarillæ, f. ℥ j.

Sig.—For one dose twice daily, after meals.

He gives details, and concludes as follows:—

A fair way to arrive at a true estimate of the hypophosphite treatment is to compare its general results with those of treatment of the whole body of the patients treated in the hospital during the same year. This is a comparison favoring the hypophosphites, as 25 per cent. of the total deaths occurred shortly after admission, the patients being in such a rapidly advancing state of disease as to preclude all attempts at systematic treatment; besides, in no case were the hypophosphites administered in which the prognosis was positively hopeless; also, when non-success was demonstrated the treatment was changed.

Of the total patients treated in the hospital during the year—viz., 428—297 improved, 56 remained *in statu quo*, 51 got worse, and 24 died.

Of those treated by hypophosphites—viz., 100—57 improved, 17 remained *in statu quo*, 26 got worse, and 4 died.

It seems evident from these statistics that the hypophosphites have no claim whatever to the character or properties of a specific remedy in the developed stages of pulmonary consumption.

In only 25 per cent. of the cases could they be employed, unaided, and these were cases that would probably have shown good results from favorable change of climate, improved dietetic and hygienic conditions, with general tonic treatment. Great disappointment resulted from its impotency in checking such characteristic symptoms of the disease as night sweats, or influencing favorably the febrile conditions indicating advancing lung mischief.

That, however, these salts, when judiciously employed, have valuable tonic properties, promoting the appetite, the digestion, and the assimilation, more especially of fatty food, was strongly impressed on all who closely watched the effects of their administration. They have evidently strong pyrogenic or heat-producing properties, acting, indeed, on the system, like phosphorus itself. This is especially the character of the hypophosphite of iron, which, indeed, renders it a very dangerous remedy in the arrested forms of the disease. These properties contra-indicate their employment in advancing stages of phthisis, where there is high temperature and increased frequency of pulse. But when the disease is arrested, they come into favorable consideration as a means of stimulating the nervous system, and through it the subordinate processes of nutrition. The feeling of languor and lassitude so often complained of by the consumptive seems often greatly relieved, and unquestionably they have valuable weight-making properties. They have certainly no specific influences (so far as I have been able, after the most careful and unbiased observation, to form an opinion), either in arresting when in progress, or markedly promoting repair when stayed, the several forms of pulmonary phthisis, whether tubercular or pneumonic.

To say that they have a specifically curative influence on the diathesis, and not on the lesion, is to relegate the hypophosphites to the category of a large number of general tonic remedies, of the good effects of which there is long, ample, and well founded experience. On the other hand, it is greatly to be regretted that the hypophosphites of lime and soda, more particularly, should have claimed for them, in terms of extravagant laudation, the character of a specific in pulmonary consumption, which they do not seem to possess, and which much-to-be-deprecated proceeding has, no doubt, largely contributed to their being regarded with suspicion, and to their undoubted properties as general or nervine tonics, perhaps even as tissue builders, being overlooked. As such they will certainly be found of great value in certain stages of treatment in appropriate cases. Indeed, this their legitimate use is very largely and increasingly recognized by the profession, and they are, with the lactophosphates of lime and iron, perhaps, the best general tonics, both in cases of incipient consumption and in the more advanced stages of that disease, when the progress of the disease has been arrested.

Case of Hepatic Colic Attended with Passage of Gall-Stones Cured with Muriatic Acid.

The following case is given by W. H. Mussey, M.D., Professor of Surgery, Miami Medical College, in the Cincinnati *Lancet and Clinic*, September 27th:—

Mrs. B., aged 42, consulted me May 31st, 1877, with the following history: for the last ten years has had paroxysms of intense suffering in the right hypochondrium, attended with jaundice, and their real nature not understood till three years since, when a large quantity of gall-stones were discharged with the fæces. At first there was six months' interval in the attacks, then four, then three, two, and during the last year only one month between the attacks, and occasionally there would be three attacks in one month.

The gall-stones varied in size and number, sometimes one large one, and at others, three large ones and several small ones.

The paroxysms would last from four to eight hours, followed with confinement to bed for several days, the recovery from them each succeeding year becoming more tedious and protracted.

For five years last past has been unable to keep up about the house. The catamenia irregular, appearing only three times in the last ten months.

Present Condition.—Skin intensely yellow,

great emaciation of the body, weight 100 pounds, when at the period of first attack she weighed 170 pounds, strength exhausted, cannot walk without support by others, and cannot step upon any elevation above the level of the floor.

I prescribed pure muriatic acid, four drops in water, every six hours. Pepsin, eight grains, after food. Fluid extract conium, ten drops in water, every hour, during the paroxysms of pain and passage of calculi.

June 27th. Patient reports herself very much improved. The pepsin was discontinued and the acid continued in the original quantity.

November 23d, 1877. Mrs. B. reports only one attack since May 31st, which commenced June 20th and lasted to July 25th, during which time she was confined to bed; in the course of this paroxysm she passed no hard stones, but hundreds and perhaps thousands of perfectly formed soft ones, and which crumbled to a powder on being touched. Health reasonably good and bowels regular. Has continued the acid as first ordered, *i.e.*, four drops four times a day, and is advised to continue the medicine once a day.

June 14th, 1878. Mrs. B. walked into my office with a firm step. I did not recognize her florid countenance and *embonpoint;* she weighs 170 pounds, a gain of seventy pounds since I last saw her. All the secretions and functions of organs are normal, and there has been no recurrence of paroxysms.

November 5th, 1878. Reports good health. No paroxysms since July 25th, 1877. Weighs 170 pounds. Still takes the acid once a day, for "fear." Has taken four ounces, by measure, of pure muriatic acid.

Weight, 1867, 165 pounds; May 31st, 1877, 100 pounds; November 5th, 1878, 165 pounds. Is cured, grateful and happy.

Hypodermic Use of Fowler's Solution in Chorea.

Dr. Perroud, lecturer on diseases of children in the Lyons Faculty, has treated cases of chorea, since 1875, by hypodermic injections of arsenic, and M. Gavin, in a recent *Thesis*, gives an account of thirty-three of the cases so treated. Four or five drops of pure Fowler's solution are injected by means of a Pravaz syringe, the region chosen being that where the cellular tissue is least dense and the nervous filaments are fewest. Generally an injection is practiced every second or third day. All the cases were females, aged from six months to fourteen years, and among them were examples of all the forms of chorea. This method is stated to be preferable, because it avoids all gastric disturbance, and the cure is generally obtained more rapidly, while the dose is very small. There is little or no local irritation induced; but in some cases intolerance of arsenic occurs, although this is rare in children. As a general rule, rapid amelioration occurs, flesh being at the same time gained, while the solid matters secreted by the kidneys diminish. In sixteen of the cases the chorea was cured after a mean duration of thirty-two days of treatment, about eighteen injections having been employed. Of thirteen others submitted to these injections, but to various other modes of treatment as well, ten recovered, a longer period, however, being required. These thirteen cases were almost all of them old or relapsed choreas, so that, contrary to the assertions of Aran, Ziemssen, and others, arsenic seems to succeed better in recent and simple than in old and inveterate cases.

Reviews and Book Notices.

Notes on Current Medical Literature.

——We take pleasure in announcing that Dr. Atkinson's new work, "The Therapeutics of Gynecology and Obstetrics," is now in press, and will be ready by the close of the year. It is on the same plan as Napheys' *Therapeutics*, and will give a succinct and full description of the most approved forms of gynecological and obstetrical therapeutics.

——The Fisk Fund Prize Essays awarded by the Rhode Island Medical Society include one on the "Artificial Feeding of Infants," by Dr. Oliver C. Wiggins; and one on Cholera Infantum, by Dr. Charles E. Banks. They are both carefully prepared essays, although presenting little that is new to the reader.

Book Notices.

The Medical and Surgical History of the Rebellion. Part II. Vol. I. Medical History. Washington. 8vo. 1879.

The whole of this huge volume of nearly 900 large quarto pages treats of diarrhœa and dysentery; or, as the editor, Dr. J. J. Woodward, calls them, the Alvine Fluxes. It is richly illustrated with photographs and engravings, and filled with interesting details of the vast varieties of those diseases which appeared in the army. It would be impossible to give an analysis of the work in the space at our disposal. We must say, however, that from the examination we have been able to give it, it is as thorough and masterly in execution as it is detailed and exhaustive in design. It were an error to suppose it merely a treatise on these diseases as they appeared in the late war; on the contrary, it examines them in all their relations and prominent examples, as recorded in the history of medicine over the whole earth and from the remotest times. Nothing, probably, of any importance has escaped the researches of Dr. Woodward; and it is to the credit of the nation as well as to himself that such a monument of enlightened industry has been issued from the press of the general government.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Half-Yearly Compendium of Med. Science,	2.50
Reporter and Compendium, - - -	7.00
Physician's Daily Pocket Record, - -	1.50
Reporter and Pocket Record, - - -	6.25
Reporter, Comp. and Pocket Record, - -	8.25

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,
115 South Seventh Street,
PHILADELPHIA, PA.

NUTRITION AND INANITION.

The general relations of food to life have been pretty definitely settled. The physiological needs of the adult human body, according to all scientific investigators, necessitate the expenditure of from 140 to 180 grains of nitrogen in twenty-four hours, *while the body is in a state of rest.* In ordinary labor about 300 grains of nitrogen will be excreted, and under great physical exertion, such as that of walking for many hours consecutively, from 500 to 600 grains.

But to say that this average indicates an invariable rule would be widely wrong. In Dr. HAMMOND'S sound little book on "Fasting Girls" he observes, "Hysteria is very frequently marked not only by the ability to endure lengthened periods of abstinence, but by the abolition of all desire for food, to such an extent that the sight or even the idea of aliment of any kind excites loathing and disgust." He cites a case in his own practice, where a young lady for twenty-nine days took nothing but a single cup of chocolate daily, and lived through it and recovered.

Nor is it necessary that the hysterical condition should be present. A case was widely copied in the press last year, in which a stowaway secreted himself in the hold of a vessel at Liverpool, and had nothing to eat or drink during the whole voyage to New York, from September 24th to October 4th, but two handfuls of salt which he found in the hold, and his own urine, which he passed in a flask he had with him and drank each time he voided it. When the vessel reached New York he was found greatly emaciated, insensible, cold and nearly pulseless, but rallied, and was convalescent after five days.

The statement has been repeatedly made that East Indian necromancers will allow themselves to be walled up for a month in a small cell, without food or water, and yet can be restored after this incredible abstinence. They undergo a prolonged secret preparation and a protracted restoration at the hands of their assistants. This has been said to be a trick, but, if so, the trick has not been discovered. It is not more wonderful than that R. Kelsey lived fifty-three days on less than a pint of water daily, a fact vouched for by Dr. JAMES MCNAUGHTON, of New York.

In the lower animals this power of living without aliment is well marked. JOHN HUNTER asserts somewhere that he was cognizant of a toad which had been kept one year without food, and survived. Dr. C. H. HUGHES, of St. Louis, relates, in a recent paper read before the St. Louis Medical Society, the instance of a hog that lived in winter, snowed in under a stack of straw for forty-six days, without food or water, and without eating or disturbing the straw about him, and came out, thin indeed, but in good health. Dr. Hughes observes on this subject—

"It is my opinion that the more this subject is looked into the more will be found to sustain the view that, when food deprivation is entirely self-imposed and voluntary, general disintegration reduced to a very low degree, and no disease existing, save just sufficient in the cerebral cortex to induce the morbid display of volition with reference to alimentation, life may be prolonged, by the necessarily very moderate daily demand on the reserve force of the system, to a much longer period than we have been generally willing to concede possible."

The study of the phenomena of hibernatiou

and æstivation—the prolonged sleep of animals in the cold seasons of the temperate and dry seasons of the torrid zone—may throw some light on these facts. They have been defined as the result of "a simultaneous modification of the innervation and circulation under the influence of a low temperature, or of a deprivation of moisture."

It is well known that many animals of high physical organization pass apparently voluntarily into this state of trance, and remain for weeks and months wholly without food or drink. With cold-blooded animals and invertebrates, it is still more common. With these numerous examples around us, there is no room for surprise that occasionally, and under exceptional circumstances, the same power is exhibited by the human race. That it is exceptional, is only too clearly shown by the frightful histories of famine and starvation which are scattered up and down the pages of history.

Notes and Comments.

Therapeutical Notes.

BISMUTH IN CHOLERA INFANTUM.

At a meeting of the Madison county, Ill., Medical Society (St. Louis *Medical and Surgical Journal*, September), Dr. H. T. Yerkes warned against astringents in this disease. He thinks a rational treatment consists in allaying irritability of the ganglionic nerve centres, and by the use of such remedies as promote digestion and allay irritation of the gastro-intestinal surfaces. For this purpose he has found nothing to act better than either the sub-carbonate or sub-nitrate of *bismuth* in large doses, combined with pepsin, and if indicated, with an anodyne and aromatics.

SULPHURIC ACID IN CHOLERA.

Dr. MacCormac, of Belfast, who had great experience in cholera in India, has urged on the English government the prophylactic treatment by dilute sulphuric acid—

℞.	Acidi sulphurici,	gtt.vj
	Aquæ,	ʒj. M.

Sig.—This amount in a cup of mint water once or twice daily.

Both in India and in the United States this has proved itself the best known prophylactic.

THE SENECIO AUREUS IN RHEUMATISM.

For removing the rheumatic diathesis, Dr. N. S. Davis (Chicago *Medical Journal and Examiner*, September,) extols the life-root plant, *senecio aureus*. In a typical case of chronic rheumatic carditis he prescribes—

℞.	Acid carbolic (crystal),	0 | 40	grams.
	Glycerine (pure),	16 | 00	"
	Tinct. gelsemium,	16 | 00	"
	Tinc. digitalis,	32 | 00	"
	Fl. ext. senecio au.,	96 | 00	" M.

Sig.—Give five grams, or an ordinary teaspoonful, in a little water, just before each meal and at bedtime.

The steady use of this, with due attention to diet and exercise, and the avoidance of all use of alcoholic drinks and tobacco, will probably do as much to counteract the rheumatic diathesis, regulate the action of the heart, improve digestion, and thereby prolong the life and usefulness of the patient, as any course of treatment we could suggest.

SUDORIFIC IN REMITTENTS.

In remittent fever, Dr. E. A. Glezen, of Indiana, says (Ohio *Medical Recorder*, June) that a favorite prescription with him is the following:—

℞.	Nitrate of potash,	ʒij
	Powdered ipecac.,	gr.xx
	Fl. ext. ginger,	♏xx
	Water,	ʒvj. M.

Sig.—A tablespoonful every hour, until sweating is fully established; then from 5 to 10 grains of quinine every three hours.

In cases accompanied with prominent head symptoms, it is proper to commence the treatment with an active cathartic; otherwise it should be avoided, as tending to prevent a crisis by the skin.

Nervous Maladies of Uncultivated People.

In curious confirmation of the strictures we made on the theory advocated by Dr. G. M. Beard and others, that increasing culture entails increase in nervous maladies, is a paper published in *La Presse Med. Belge*, August 31st, from the pen of Dr. Wilmart, on the character of the peasantry of Central Russia. They are, he says, of the middle height and below this. They are of very nervous temperament, of slight endurance, passing rapidly from enthusiasm to discouragement. They will not submit to the slightest operation without chloroform; they can bear only small doses of medicine, and even slight inflammatory affections are soon complicated by delirium, convulsions, etc. Steeped in ignorance, and possessed of little power of moral resistance, they readily abandon themselves to the deepest melancholy, easily yielding to the impulse to suicide, especially by drowning.

Among the diseases of the peasantry, those of the nervous system hold the first rank, hysteriform neuroses prevailing equally among men and women. Pain is a prominent symptom, and large quantities of opium are taken for its relief. Anæmia is very prevalent, especially among females.

Hydrophobia in Rabbits.

The *Lancet* notices some interesting facts regarding rabies, ascertained by M. Galtier. Canine rabies is transmissible to the rabbit, which becomes a convenient and inoffensive means of testing the virulence or non-virulence of different fluids of the body of a rabid animal. He has availed himself of this to study the virulence of the secretions of the rabid dog, sheep and rabbit. The rabies of the rabbit is transmissible to animals of its own species. He could not say whether the virus is as intense in the rabbit as in the dog. The predominant symptoms in the rabbit are paralysis and convulsions. The duration of life after the first manifestations of the disease is from a few hours to one, two three, and even four days after the disease has definitely declared itself. The period of incubation is shorter than in other animals, the average duration in twenty-five cases having been eighteen days. The administration of salicylic acid has no power to hinder the development of rabies in an inoculated animal. The saliva of a rabid dog, collected from the living animal and preserved in water, retains its virulence for twenty-four hours. Hence, the water in a trough in which the rabid dog has allowed its saliva to fall in trying to drink, must be regarded as virulent, at least for this length of time.

Brown-Sequard's Theories of the Nervous System.

This eminent teacher continues to announce that his experiments and researches prove that the doctrines of cerebral localization are erroneous and based on false assumptions. His demonstrations are striking. Thus, in an animal in which the right motor half of the pons varolii was incompletely divided, the left half of the bulb was afterward cut through, there remained no other way of communication between the two halves of the encephalon than by a small portion of the anterior longitudinal mass of fibres on the right side of the protuberance. Now, in this case, the galvanization of the motor centres at the right and at the left caused exactly the same movements in the limbs of the side opposite to the centres. The experiment was repeated a number of times, always giving the same results.

It is observed by M. Grasset that the whole doctrine of Prof. Brown-Séquard is governed by two entirely new principles, viz. :—

1. All the phenomena which one ascertains after limited experimental or clinical lesions of a part of the cerebrum are produced by action at a distance.

2. There are no agglomerated and circumscribed centres in the cerebrum for any function. There are certainly special cells, distinct elements, but these cells are distributed through the whole mass of the cerebrum. In other terms, there are no circumscribed, but diffuse centres.

Synthetic Production of Salicin.

The *American Journal of Pharmacy*, October, remarks that synthesis of a glucoside or glucose-yielding vegetable substance, is an important event in itself, as this had never been accomplished, but in this case it seems doubly important, as the method seems to be one capable of general application, and may lead to much greater results. A. Michael has just effected this synthesis in Wurtz' laboratory. Taking the so-called aceto-chlorhydrose, the product of the action of acetylchloride upon glucose, and acting with it upon potassium carbolate and potassium salicylite successively, two compounds were obtained, both of which showed the characters of glucosides. The first of these new substances does not appear to be found, as yet, in nature. Michael calls it *pheno-glucoside*. The second not only possesses the composition of helicin, an oxydation product of salicin, but examination shows it to be absolutely identical with the naturally derived product. The helicin, acted upon with nascent hydrogen, yields *salicin*, the glucoside of the willow.

Pilocarpin in Ophthalmic Practice.

After a careful study of this drug, Prof. Chalot, of Montpellier, doubts the value of it in ophthalmic cases. In his paper on the subject, after having observed that injections of this kind have not given any satisfactory results in uni- or bilateral hydrarthrosis, in simple hydrocele, or after amputations, the author proceeded to give the history of the use of pilocarpine in affections of the eye, and related several cases that had come under his notice in the service of M. Courty. In one case, where extraction of the cataract had been performed after von Gräfe's method, he injected chlorhydrate of pilocarpine; but,

another treatment having been carried on at the same time, he was unable to arrive at a definite conclusion on the subject. In another analogous case the patient became unconscious, and exhibited phenomena of intoxication after the fourth or fifth injection; that was the only result that had been obtained in this case. The same took place in four or five more cases of affections of the eyes that were treated in the same way. Patients, as a rule, do not tolerate these injections easily, and often object to them. They are frequently followed by symptoms of excitement, and in some cases of intoxication. There seem to exist no relations between the physiological and therapeutical effects of the drug, and no good results have ever been obtained.

Percentages from Druggists.

Our comments, some months back, on the impropriety of physicians taking percentages on the prescriptions they send to druggists, has met the approbation of many honorable men and journals. The Chicago *Pharmacist* speaks of the prevalence of the swindle in that city. It says—

"Many physicians in this city demand as high as forty per cent. on the gross price of their prescriptions to patients, while others are content with twenty-five per cent., and yet others only ask their office rent, while a goodly number only expect cigars and liquors free. Some degree of collusion between druggists and physicians exists almost everywhere, and probably always will, but the practice of giving any very substantial inducements to the physician for his influence is commercially and morally wrong."

How long shall this discreditable state of things last? Will not the medical societies take some action?

Active Principle of Eriodyction Californicum.

Apropos of Dr. Wilson's article on Yerba Santa, we note that at the last meeting of the National Pharmaceutical Society Mr. Charles Mohr, of Mobile, reported a very full examination of the plant, and the action of the various solvents in regard to the amount and quality of extractive matter. The properties are believed to be due chiefly to the resinous matter, which is best extracted by alcohol, to which it yields nearly eleven per cent. of its weight. It yields an ethereal extract of fifteen per cent. and an aqueous of nineteen per cent., but that which is taken up by alcohol seems more satisfactorily medicinal in its character.

Its apparent action is as an astringent and tonic to the bronchial tubes, but as a remedial agent in consumption he thinks it no better than many other panaceas whose uselessness was long ago proved.

Peritoneal Affections of Drunkards.

At the late meeting of the French Association for the Progress of Science, M. Leudet, of Rouen, read a paper on Affections of the Peritoneum in Drunkards. These consist—1. In gradually progressive ascites, which can only be cured by tapping and the administration of powerful cathartics, provided the mucous membrane of the intestines be healthy; 2. In a granular peritonitis, which in exceptional cases ends in the formation of adhesions between the serous membranes. In some cases the peritoneal cavity contains a bloody fluid, but never a purulent one. The aforesaid lesions progress very slowly and insidiously. M. Leudet thinks, too, that they are of a similar nature to the alterations produced by alcoholism, both in the liver (cirrhosis) and in the intestines (enteritis, ulcerations).

Intestinal Calculi.

It is not generally known that calculi form in the intestines in some instances, quite independent of gall stones or other formations. At the late meeting of the French Association for the Progress of Science, M. Marquis read a paper on the subject, in which he proceeded to give a case of intestinal lithiasis that had come under his notice. The patient was a very anæmic woman, who constantly passed in her stools small, granular, oblong, brownish bodies, which were evidently formed in the intestines, but were neither biliary nor renal calculi. There was simultaneously a considerable hyper-secretion of the intestinal mucus. It seemed as if the gravel were produced in greater quantities the more anæmic the patient became.

Capillary Punctures in Ascites.

M. Hemot, of Reims, read, at the French Association, an interesting communication on this subject. After having drawn attention to the danger which attends the practice of evacuating suddenly, in a case of ascites, a large quantity of liquid, and to the accidents to which this apparently mild operation frequently gives rise, he pointed out how little harm could result in such cases from capillary punctures. He quoted several cases in which five or six punctures, made at certain intervals from each other, gave the

desired result. The operation is extremely simple; the instruments used are merely a small trocar, such as every surgeon carries in his pocketbook, to which a rubber tube is adapted. Another important point in this method is that the abdominal walls do not lose their elasticity, which would be the case if the fluid were allowed to escape rapidly. In this way the rapid reproduction of the liquid is prevented.

Correspondence.

Supposed Congestive Chills Caused by Lumbrici.

Ed. Med. and Surg. Reporter:—

I was called September 19th, 1872, to see Mrs. B., aged 19, German. Had given birth to a well developed female child six weeks prior to my visit. I was informed she had a very easy labor, for a primipara; was up doing her house work in two weeks. Up to the day before I was sent for she had good health.

She was attacked with a light chill, which did not last long; fever followed, continuing for some hours; after it subsided she remained sick at the stomach. When I came she had no fever, but was weak; looked pale, eyes looked glassy, the extremities cold, and covered lightly with a clammy sweat. Tongue clean, bowels regular, temperature normal. Kidneys secreted natural. She gave plenty of nourishment to the infant, which was in a thriving condition. I looked upon the case as of a malarial character, and prescribed the usual remedies.

September 20th. Was sent for in great haste, the messenger stating the family thought she was dying. It was some time before I got there; when I did she was doing well, no fever, sweating over her entire body, temperature normal. Her husband told me she rested well all night; about noon he noticed she looked amiss, and went to the bed to ask her if she wanted anything, whereupon he found she was unconscious. She was cold as death, from head to foot, bathed with a clammy sweat. They sponged and rubbed her person for over an hour, with alcohol, before any signs of life appeared, except the slow beating of the heart, which an old lady still kept observing while the friends kept sponging and rubbing. Thinking she had had a congestive chill I prescribed accordingly, giving heroic doses of sulph. quininæ and stimulants.

The next day, 21st, about the same time, she had another spell, similar but harder and longer continued. She took during the interval ʒj of the sulph. quiniæ and ℥iv of brandy, besides nourishment, in plenty. I did not witness this one either. I found her in precisely the same condition as the day before. Thinking there was something connected with the case which I could not fathom, I requested the friends to get council; they acquiesced, and I sent for my friend, Dr. W. J. Stewart; he came early on the morning of September 23d; he examined the case thoroughly, but could not detect anything more than, as he supposed, remittent fever. We continued the same line of treatment, giving all the directions necessary, and left, I promising to be there at noon; then found her comfortable; she had eaten with a relish; I watched her very closely; in about one hour after she ate her dinner she commenced to moan. She was pale as death, eyes open, staring toward the window, cold over her entire body and extremities, a clammy sweat exuding from the skin in a very profuse quantity, pulse very slow, temperature 95°, pupils about normal in size; could not get her to pay attention to anything whatever; would never change her position, never moved her eyes; no spasmodic action of any muscles, or twitching of the nerves. We used the same remedies as before, placing bottles of warm water along her body, jugs to her feet, filled with as warm water as was consistent. She did not appear to feel the heat or hard rubbing that was performed by the lady attendants. In the course of two hours she became rational and rested well; stated she was unaware of anything that transpired. Not knowing how to prevent, or even to mitigate, these attacks, I was at my wit's end, after giving the heroic remedies, and apparently of no avail. I again requested the friends to call council.

September 24th. Dr. R. Milligan, of Fort Recovery, Ohio, met me. He being the oldest physician in this part of the country, I considered he certainly would get a clue to this phenomena. I stated the entire history to him, and he examined her very carefully. While he was there she took one of those "sinking chills," as he called them, equal to any she had had. He told me that they were not congestive chills, but that they would have to be called that, in the absence of any other name. He suggested to pursue the same course. If that did not save her nothing would. I did as he directed for some three days, with the same results, only she was getting weaker each day. What surprised me the most was, she rested well every night, slept naturally, was comfortable in every respect, ate and relished her food, and gave sufficient nourishment for the infant, which grew finely. She passed urine sufficient in quantity all this time; bowels regular, of proper color and quantity.

On the evening of the 27th she told her mother-in-law she felt something in her throat, which, as she said, moved, and was alive. The old lady raised her head up, looked down her throat, and discovered a large lumbricoid, which she drew out. It measured thirteen inches. I arrived shortly after, and the old lady showed it to me. I discarded all the heroic doses we were giving, of antiperiodics, and left three powders, composed of santonine, hyd. chlor. mitis, of the usual dose, to be given two hours apart, to be followed, in the morning, with half an ounce of olei ricini, with twenty drops of turpentine, with the result that in four hours after she evacuated a solid knot of lumbri, as near as we could count containing thirty-nine; there was nothing else passed. In about three hours she had another discharge from the bowels, which filled an ordinary chamber mug two-thirds full of living and dead worms, all of the lumbria species. The amount surpassed anything I ever beheld, there was very little of anything

else. She kept passing a few nearly every discharge, for about a week. She commenced to improve at once. She had no chill that day, nor ever afterward. She made a good recovery in a very short time, and has been hearty ever since. J. A. Hutchinson, M.D.

Salamonia, Ind.

Disinfectants.

Ed. Med. and Surg. Reporter:—

All of our Dispensatories are silent, or nearly so, on the subject of disinfectants and deodorizers, which, I think, is a serious defect. The subject of sanitary precautions against the cause and spread of disease is daily attracting more and more the attention of the profession and the public, and some portion of our Dispensatories ought to be devoted to this subject. Even Buck's sanitary work, valuable as it is, does not go into this subject as minutely as it should; that is, though it mentions varieties of disinfectants and disorders in general terms, it does not tell us accurately how to prepare them, and how and in what quantities to use them. For instance, if it says Condy's Fluid, it does not tell how to use it, and it is not mentioned in the index of that work. All do not know that it is permanganate of potassa. Strange as it may appear, most country physicians, I am sorry to say, have very meagre libraries, as they are generally poor; and if writers on medicine would publish good works on this and kindred subjects, they would sell much more readily than scientific works on cell formation, or which end of a rat's tail is first formed. For the country physician, and I might add, for some in the city, plain facts—how to prescribe for and cure their patients, and how to prevent diseases—are of more importance than elaborate and scientific treatises, which, though important to the literature of the science of medicine, are really of no practical importance.

Danbury, Ct. E. P. Bennett, M.D.

News and Miscellany.

Dr. Sayre at the International Medical Congress.

The *British Medical Journal* says—

Among the more interesting demonstrations of the International Medical Congress at Amsterdam, were those by Dr. Sayre, of his method of treatment of spinal curvature and Pott's disease by suspension and the plaster jacket. The method was already known and successfully practiced by a few surgeons in Holland. The brilliant success of Dr. Sayre's remarkable demonstration will undoubtedly contribute to popularize rapidly this invaluable boon to surgeons and patients. The cases included one of a patient wearing one of the recent modern and highly improved apparatus, for the treatment of lateral curvature. At once, on removal of the apparatus, it was found that the patient stood nearly an inch higher without it than with it, as will often be found, on careful measurement, after removing any "special instrument;" for nearly all, by the downward pressure on the shoulder, actually depress the column vertically, while they exercise lateral pressure on the convexity of the spinal curve. The suspension made and the jacket applied, the patient, carefully measured by the surgeons present, was found to have gained another inch and a quarter, and moved about with an ease and comfort to which he had long been a stranger. The immediate satisfaction and relief afforded, and the rapid and easy cures of Pott's disease and of spinal curvatures effected by Sayre's method and jackets, are now matters of such everyday knowledge and experience, that we can readily appreciate the enthusiastic satisfaction with which the demonstration and introduction of this method of treatment was hailed by new audiences of surgeons to whom they are still novelties. Dr. Sayre received the accustomed and well deserved tribute of enthusiastic approval of the large, crowded, and highly informed section of foreign surgeons before whom his brilliant demonstration was made. We say accustomed, because the same experience may have been noted wherever Dr. Sayre has demonstrated his method before an audience of medical men, whether at the great hospitals of London, at the congresses of Manchester, at Liverpool, or at Cork.

International Congress of Hygiene.

The third International Congress of Hygiene will take place at Turin, in April, 1880, under the patronage of the Italian Government. As at Brussels, in 1876, and at Paris, in 1878, the Congress will avoid political and religious discussions. At the Paris Congress last year there were eighteen nationalities represented, the Russian, German, and other governments appointing special delegates. It is anticipated that the forthcoming Congress will be equally well attended. Medical men will, of course, form the majority of the Congress, but chemists and veterinary surgeons are to have a place reserved for them. Architects and engineers are also invited, as with them to a large extent rests the application of the principles which men of science have discovered.

The Medical Law of California.

The San Francisco *Western Lancet* says—

The Medical Law of California is, perhaps, as perfect an instrument, practically, for the protection of medicine, as any yet devised. It is doubtful whether, in any State of the Union, there is a law which works so satisfactorily as does ours, in spite of the predictions of so many of the profession that it would fall to the ground. It has been declared constitutional by the highest tribunal of the State, it is upheld to the letter by the judiciary, and it is enforced actively by the police authorities. Arrests of notorious quacks are now of constant occurrence, and to the credit of the magistracy be it said, convictions follow in every case, the few who escaped punishment doing so through some flaw in the evidence only. The fight has been a long and hard one to get the law into shape, but it is now dealing efficient strokes upon the empiric hosts, and nothing but the apathy of the profession need hinder it from routing the bulk of them out of the State, bag and baggage.

Higher Medical Education.

The Medical Department of Yale College has announced that its system of instruction is now arranged in a graded course, extending over three full years, and that all candidates for admission, excepting those who have passed an examination for admission to Yale College or some similar institution, must present a degree in Letters or Science from a recognized college or scientific school, or pass an examination in the following subjects:—

1. Mathematics—Algebra to Quadratics; Euclid, 2 books; Metric System of Weights and Measures.

2. Latin—Translation of easy prose or of Virgil's Æneid.

3. Physics—Balfour Stewart's Elementary Physics, or any equivalent work.

These examinations will be conducted in writing. Grammar, spelling and construction will be considered in judging of the papers. Graduates in medicine will not be required to pass this examination for admission.

The Detroit Medical College makes a similar announcement, requiring three regular sessions, and an examination at matriculation. But this examination does not include any Latin (an unfortunate omission), and no geometry.

Shady Lawn, Massachusetts.

This institution is at Northampton, Mass., under the care of Dr. A. W. Thompson, formerly of Northampton Lunatic Hospital, and a gentleman of large acquirements. It is designed especially for Diseases of the Mind and Nervous System; Medical and Surgical Treatment of Ailments of Women; The Alcohol and Opium Habits; The Laryngitis of the Seaboard; and Chronic Diseases of similar character.

In the treatment of mental disease Dr. Thompson has introduced the plan of systematic study as a means of strengthening the intellect. Of course, it is carried out on a plan adapted to the peculiar nature of the case; and we understand the results have been satisfactory. Physicians in search of an institution to which to direct patients of the classes mentioned will do well to correspond with Dr. Thompson.

The Williamson County (Ill.) Medical Association

met in regular meeting on Monday, October 7th, S. M. Mitchell, M.D., President, in the chair.

Dr. Fly read a paper on the Relation of Telluric and Meteorological Conditions to Malarial Fever.

A young man presented himself for examination, with a tumor in the supra-scapular region, which was diagnosed by the Association to be an aneurism of the subclavian artery.

Dr. Bently reported three cases of diabetes insipidus, and stated that he treated them all successfully with the tincture of chloride of iron, also one case of phlegmonous erysipelas of the leg.

On motion of Dr. Ferrell, Dr. Fly was requested to furnish the report of the proceedings to the Medical and Surgical Reporter.

Anti-Vaccination Society.

The fools not being all dead yet, a number of them came together in New York last month, and organized an anti-vaccination league. It was presided over by some irregular practitioners connected with an eclectic college there.

Mr. William Tebb, an English gentleman residing in London, whose repeated refusals to have his daughter vaccinated was the cause of his being prosecuted by the authorities 13 times, and fined in a majority of the cases, was present at the meeting, and gave it the benefit of his experience and martyrdom.

Suicide in Germany.

Suicide seems to be on the increase in Germany. From the statistics for the year 1878 we gather that the figure of 1126 was reached, out of which 215 were women; in 749 cases death was produced by hanging, in 217 by drowning, and in 88 by injury to the brain.

The causes are thus assigned: In 284 instances melancholia, in 105 disgust of life, in 94 intemperance, in 90 intellectual disturbance, in 89 privations, in 65 physical suffering, and in 39 love. The ages varied from 90 to 14 years.

Personal.

—The death of Dr. James Graham, Emeritus Professor of the Ohio Medical College, took place last month.

—Dr. Henry Maunsell, one of the authors of Maunsell and Eavenson's *Diseases of Children*, died in Dublin last month, at the age of 73 years.

—Dr. E. S. Gaillard, having severed his connection with the Louisville Medical College, has removed to New York city, where he will henceforward reside, and where he will also publish the *Richmond and Louisville Medical Journal* and the *American Medical Biweekly*. His address will be 27 Clinton Place.

—The *Allg. Wiener Med. Zeitung*, announcing that Professor Hebra has been made a Hofrath, on account of the great services which he has rendered to science, observes that this is a well-deserved recognition of the deserts of one who is an ornament to the Vienna School of Medicine, to the celebrity of which he has so much contributed for more than thirty years.

A Sip of Punch.

Patient—Do you mean to say my complaint is a dangerous one?

Doctor—A very dangerous one, my dear friend. Still, people have been known to recover from it; so you must not give up all hope. But recollect one thing: your only chance is to keep in a cheerful frame of mind, and avoid anything like a depression of spirits!

Correction.—In Dr. Houtz's letter, page 350, in the next to the last sentence, *one-sixteenth* of a grain of atropia should read *one-sixtieth*.

Items.

—An Irish woman died last week, in New York, at the alleged age of 112 years.

—A Berlin dispatch to the London *Post* says: "The Municipal Council recommended the universal adoption of the practice of cremation."

—The late Dr. Le Moyne's will leaves his crematory in trust to his executors and their successors, for residents of the borough, or within five miles, who wish to use it, the charges in each case to cover the expenses of the burning.

—The National Board of Health has appointed a committee to meet the railroad representatives, and aid in the preparation of a system of rules and regulations governing inspections. It is hoped that the proprietors of steamboats interested in the subject will take similar action, to meet in conference.

—Addressing a large audience recently, on his return from exploration in Northern Siberia, Captain Wiggins said that, from his experience in long journeys through the heart of the country in midwinter, by sledges, he was strongly in favor of the benefit of abstaining entirely from the use of any kind of intoxicating drinks.

—A physician of Tallahassee writes to the National Board of Health, in October—

The country between our high lands and the coast is now affected to an unusual degree with malarial fevers of severe type, due, no doubt, to the extraordinary rainfall of the past few months, which has submerged a large portion of the low lands. At other times this portion of the country has been considered very healthy.

OBITUARY NOTICES.

—Dr. O. A. Carroll, a highly esteemed physician of Port Jervis, N. Y., has died. Resolutions of respect were passed by the Tri-States Medical Society, at its regular annual meeting, held at Port Jervis, October 8th. 1879.

—Dr. Isaiah W. Clawson, of Woodstown, N. J., died October 19th. The deceased was born March 30th, 1822; graduated at Princeton College in 1840; studied medicine in the University of Pennsylvania, taking his degree in 1843; was a member of the State Assembly in 1853; was elected a representative to the Thirty-fourth Congress and re-elected to the Thirty-fifth, serving as a member of the Committee on Revolutionary Claims.

—Mr. G. W. Callender, F.R.S., Surgeon to St. Bartholomew's Hospital, Examining Surgeon to the Royal College of Surgeons, etc., died at sea, in the "Gallia," October 27th. Mr. Callender arrived in this country September 3d, and after a visit to Canada and the White Mountains, came to this city, to pass some time with Dr. Levis and other friends. Here he was attacked with an acute exacerbation of parenchymatous nephritis. There was marked œdema of the extremities, and copious albuminous deposits, with granular and hyaline casts in the urine. He received every attention from his professional friends, but was exceedingly desirous to return home, to which they gave a reluctant consent. He sailed October 22d, with the result above stated. As a distinguished surgeon, an agreeable companion, and a gentleman of the highest character, he will be widely and long regretted.

QUERIES AND REPLIES.

Dr. I. M. S., of N. J., asks, "What is the best book on Domestic medicine, and price?"

Ans.—We know of none superior to the "*Handbook of Popular Medicine*," by the late Dr. G. H. Napheys; price $2.00.

Dr. C. W. S., of Mass.—We do not club with the paper you speak of.

Advocatus.—Coffee, it is believed, produces anæmia of the brain; hence the vertigo which its use produces in some people.

Dr. Antonio.—The alleged age of "old Parr" is considered apocryphal.

MARRIAGES.

BENJAMIN — WHITE.—At the residence of the bride's uncle, Dr. J. M. Ridge, in Camden, N. J., on the 4th ult., by the Rev. Dr. Garrison, Dr. Dowling Benjamin, of Camden, and Miss Sallie Cooper White, of Bucks county, Pa.

HAMNETT—GREEN.—At Meadville, Pa., on the 7th ult., by the Rev. G. A. Cartsensen, assisted by Prof. J. Hamnett, D.D., William C. Hamnett, of Toledo, Ohio, and Katharine Wise Green, daughter of Dr. Alfred W. Green.

JOHNSON — BROCK.—On the 1st ult., at St. Clement's Church, this city, by Rev. Dr. Henry A. Coit, assisted by Rev. O. P. Prescott, Dr. Robert W. Johnson, of Baltimore, Md., and Julia W. H. Brock, daughter of John Penn Brock, Esq., of this city.

LOY—CHAMPLIN.—In Cincinnati, Ohio, October 2d, at St. John's P. E. Church, by Rev. Mr. Kinsolving, Dr. E. E. Loy, and Miss Nellie Champlin.

RIGGS—CHEESMAN.—In New York city, on Wednesday, October 8th, at the Church of the Transfiguration, by the Rev. George H. Houghton, D.D., assisted by the Rev. J. Tuttle Smith, George W. Riggs, Jr., and Kate, daughter of Dr. T. M. Cheesman.

SCUDDER — DAVIS.—In Cincinnati, Ohio, on Thursday, October 9th, by the Rev. W. H. Neilson, Jr., Henry Darcy Scudder, and Marvina James, daughter of Dr. J. M. Davis, of this city.

TIFFANY — GOODMAN.— At Salisbury Mills, Orange county, N. Y., October 2d, by Rev. D. J. Atwater, Loring O. Tiffany, of Harford, Pa., and Martha, daughter of A. Goodman, M.D.

TRASK—HOPKINS.—In New York city, on Wednesday, October 15th, at the Madison Avenue Presbyterian Church, by the Rev. William Lloyd, Frederick Marquand Trask, M.D., and Mary, daughter of the late Gustavus U. Hopkins.

KOONS—BREWSTER.-On Thursday, October 16th, 1879, by the Rev. E. E. Erskine, D.D., Philip R. Koons, M.D., and Miss Ninna R. Brewster, all of Newville, Pa.

DEATHS.

CLAPHAM.—Of apoplexy, at Astoria, Long Island, on Saturday, October 11th, 1879, Eduard Clapham, M.D.

KEELER.—In New York city, October 6th, 1879, Mrs. Hattie A. Keeler, wife of Dr. W. T. Keeler, aged 23 years, of consumption.

PALMER.—At Haywards, California, October 13th, Theodore D. Palmer, M.D., son of the late Captain Theodore D. Palmer, of Stonington, Conn.

PEUGNET.—In New York city, suddenly, on Friday, October 10th, Dr. Eugene Peugnet, of Fordham, in the 43d year of his age.

PHILLIPS.—In New York city, on Friday morning, the 10th ult., of pneumonia, after a brief illness, Henry J. Phillips, M.D., Captain and Assistant Surgeon, U.S.A

HORSFORD'S
Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges.

LESSONS IN GYNECOLOGY.

By WM. GOODELL, A.M., M.D.,

Professor of Clinical Gynecology in the University of Pennsylvania.

WITH NUMEROUS ILLUSTRATIONS.

1 Vol., 8vo. Price, Cloth, $3.00.

This entirely new and complete work by this distinguished author cannot fail to prove a valuable addition to gynecological literature. The following table of contents will indicate its scope:—

Lesson I. Gynecological Instruments.
" II. Caruncle, and other Affections of the Female Urethra.
" III. Vesical Diseases of Women.
" IV. Fistulæ of the Female Genital Organs.
" V. Closure of the Vulva for Incurable Vesico-vaginal Fistulæ—Tumors of the Vulva.
" VI. On the Causes, Prevention, and the Cure of Lacerations of the Female Perineum; the Primary Operation.
" VII. Secondary Operation for Laceration of the Female Perineum.
" VIII. Local and Constitutional Treatment for Chronic Metritis and Endometritis.
" IX. Retroversions and Retroflexions of the Womb.
" X. Anteversions and Anteflexions of the Womb.
" XI. Dilatation of Cervical Canal; Rapid Dilatation; Tents.
" XII. On the Use of the Closed Lever Pessary, and of the Intra-uterine Stem Pessary.
" XIII. Different Kinds of Pessaries; Abdominal Supporters.
Lesson XIV. Prolapse of the Womb; Prolapse from Simple Descent; Prolapse from Hypertrophic Elongation of the Infra-vaginal portion of Cervix.
" XV. Prolapse of the Womb from Hypertrophic Elongation of the Supra-vaginal Portion of the Cervix.
" XVI. Laceration of the Cervix Uteri.
" XVII. Cancer of the Womb.
" XVIII. Vegetations of the Endometrium.
" XIX. Polypus of the Womb.
" XX. Fibroid Tumors of the Womb.
" XXI. Treatment of Fibroid Tumors of the Womb.
" XXII. Spaying for Fibroid Tumors, and for other Diseases of the Womb.
" XXIII. Ovarian Cyst; its Diagnosis, and its Treatment by Tapping, by injections of Iodine, and by Drainage.
" XXIV. Ovariotomy by Abdominal Section.
" XXV. Vaginal Ovariotomy.
" XXVI. Nerve-tire and Womb-ills, or the Relation which the Nerves bear to the Diseases of Women.
" XXVII. The Prevention of Uterine Disorders.
" XXVIII. The Sexual Relations as Causes of Uterine Disorders.

No. 115 South Seventh Street, Philadelphia.

NEW REMEDIES.

FLUID EXTRACTS.

Coto Bark.—From BOLIVIA. Almost a specific in acute and chronic diarrhœa, cholera, cholera morbus, etc.

Cascara Sagrada.—(**Rhamnus Purshiana.**) From the PACIFIC SLOPE. A certain remedy for habitual constipation; and very useful in all cases where a laxative or cathartic is indicated. Beware of the fluid extracts of spurious varieties of this bark.

Folia Carobæ.—From BRAZIL. A powerful alterative, which exerts a marked curative action in syphilis, scrofula and kindred disorders.

Rhus Aromatica.—A remedy in diabetes, and other diseases of the genito-urinary organs.

Damiana.—(**Turnera Aphrodisiaca.**) From MEXICO. The best known aphrodisiac. Of great value in impotence, spermatorrhœa, and loss of sexual appetite.

Boldo.—(**Peumus Boldo.**) From CHILI. The new tonic. Very useful in dyspepsia, hepatic torpor, yellow fever, etc.

Berberis Aquifolium.—From CALIFORNIA. Has marked alterative and tonic powers, and has been used with extraordinary success in salt rheum, psoriasis, eczema, scrofula and syphilis.

Black Haw.—(**Viburnum Prunifolium.**) From the UNITED STATES. Employed to prevent abortion and miscarriage.

Grindelia Robusta.—From CALIFORNIA. A valuable curative agent in asthma and diseases of the air passages.

Grindelia Squarrosa.—From CALIFORNIA. Anti-malarial. Used in enlarged spleen and other malarial diseases.

Cereus Bonplandii.—(**Cereus Grandiflorus and Cereus McDonaldii.**) From MEXICO. Heart sedatives. Very useful in controlling functional and organic disturbances of the heart.

Kaki.—(**Diospyros Kaki.**) From JAPAN. Peculiar action on the mucous surfaces. Useful in mucous dyspepsia, typhoid fever, etc.

Cercis Canadensis.—Indigenous. A positive remedy in chronic diarrhœa, dysentery, etc.

Jaborandi (diaphoretic). **Guarana** (sick headache). **Fucus Vesiculosus** (anti-fat).
Bearsfoot (enlarged spleen). **Coca** (nervous stimulant). **Kava Kava** (Gonorrhœa).
Eucalyptus Globulus (antiseptic and anti-malarial). **Yerba Santa** (coughs).
Yerba Reuma (catarrh). **Wood Betony** (dyspepsia). **Ustilago Maidis** (oxytocic).
Penthorum Sedoides (catarrh). **Soap Tree Bark** (tooth wash).

CRUDE DRUGS.

Goa Powder (ringworm and diseases of the skin). **Gurjun Balsam** (a substitute for Copaiba).
Alstonia Constricta (a substitute for Calisaya).

SUGAR-COATED GRANULES.

Calcium Sulphide 1-10 gr. (for the cure of boils and carbuncles).

Our limited space prevents our describing in detail the history and application of each remedy, but to those interested in NEW REMEDIES, we will say, that we can furnish interesting information relative to the above new drugs.

PARKE, DAVIS & CO.,

DETROIT, - MICHIGAN.

Our New Remedies can be procured of the Drug Trade throughout the United States. By specifying **"P., D. & Co.'s"** in all cases, you will ensure reliable preparations of the **true drugs.**

SOLUBLE

Pills and Granules.

UNEQUALED FOR

Purity in Composition, Solubility in Coating, Uniformity in Size, Perfection in Form and Finish.

1. The best materials are used in their manufacture.
2. No article required by a formula is omitted on account of its high cost.
3. No Pills are deficient in weight.
4. The Pills are Coated while soft.
5. There is but one Coating, which is perfectly soluble, and there is no sub-coating of resinous character.
6. The Coating is so transparent as to clearly reveal the color of the mass, and its solubility is not impaired by age.

Our list of Pills and Granules embraces those made according to the formulæ of the U. S. Pharmacopœia; also most of those in common use among the profession.

Trade supplied in Philadelphia by

ROBERT SHOEMAKER & CO.

Original Department.

Lecture.

THE PATHOLOGICAL MUSEUMS OF GREAT BRITAIN.

Extracts from the Introductory Address delivered at the opening of the Term of 1879-80,

BY A. VAN DERVEER, M.D.,

Professor of Principles and Practice of Surgery in the Albany Medical College.

[After describing in detail the very excellent museum of the Albany Medical College, founded by Drs. Alden March, James H. Armsby and James McNaughton, the lecturer proceeded to compare it with some of the most celebrated collections in Great Britain]. * * * * *

Regarding Ireland, Dublin may be said to be the great centre for medical instruction. There are excellent hospitals, medical schools, colleges and museums, at Cork, Belfast and Galway, and many local dispensaries throughout the country, but the museum connected with the Royal College of Surgeons in Dublin undoubtedly surpasses all others. It contains a most excellent collection in comparative anatomy, and also exhibits a fine variety of well preserved mummies, in their various positions, as brought from Egypt and Peru. I did not find a better collection anywhere else than here, of wet specimens showing the various developments of the hermaphrodite. The wet specimens exhibiting stricture of the urethra and œsophagus, as well as those of diseases of the bladder, prostate gland and kidneys, were also particularly good. But few good specimens are presented of diseases and fractures of the bones. At Glasgow I visited the Andersonian University, an institution strictly medical, which has a good but not large museum attached. I was fortunately admitted into the private museum of its Professor of Anatomy, Dr. Geo. Buchanan, and to see the wonderful dissections he has made and preserved was a great pleasure. The buildings of the Glasgow University, in outward appearance and internal arrangements for its various museums, are the finest I have ever seen. Here I saw nearly all the valuable specimens left by the celebrated Dr. Wm. Hunter. I was amazed to see the specimens exhibiting the gravid uterus. The embryo and fœtus, perfect in its membranes, can be seen at any age. The collection in monstrosities is also wonderful. This museum has a good collection in every department. The janitor was a physician who had resided for many years in this country, and who speaks very flatteringly of our own museum.

Dr. Wm. Hunter made his museum to be of great service to him in giving medical evidence in the courts of England, where he often appeared as an expert, and for many years judges continued to avail themselves of his writings in their rulings and charges.

The museum connected with the University of Edinburgh excels in its department of comparative anatomy, but is not remarkable otherwise. One great peculiarity is that each professor has his own private collection to illustrate his lectures. It is here you find the immense collection of vesical calculi left by the great surgeon, Abernethy. They are well worth one's study.

In the splendid new pathological building connected with St. Thomas' Hospital, London, they have a well arranged but not large museum. It

is made mostly of wet specimens, well bottled and labeled, of diseased testicles, and dissections and operations of hernia, left by Sir Astley Cooper. It has also a fine array in comparative anatomy.

The museum connected with St. Bartholomew's Hospital is a fine affair, particularly in its arrangements. It has an excellent collection in dissections of the human body, also in comparative anatomy, and a large cabinet in materia medica. Here are exhibited some remarkable specimens of renal stones, some very large, and showing the imprint or cast of the pyramids and pelvis of the kidney. There are many fine specimens of vesical calculi also. Preserved as wet specimens, are transverse sections of the arm, forearm, thigh and leg, showing the skin, muscles, impacted vessels, the nerves and bones, as perfectly as in the frozen specimen. I may also mention exceedingly truthful dissections of the brachial plexus of nerves and of the elbow; all the vessels of the hand, popliteal space and sole of the foot; other sections, showing the origin of the cranial nerves and the anatomy of the base of the brain; transverse sections showing the posterior openings of the pharynx, the base of the skull internally and externally, also the carotid artery, injected, as were the other vessels of the neck. There are many sections of the face, showing the anterior openings of the pharynx, the mouth, the nose, of the eye, and many others, of the joints. The dissections showing the female bladder, vagina, urethra, uterus, and its attachments, the rectum, and a triangular section of the inner anterior surface of the uterus, showing the rugæ of the cervix and vagina, the ovary and fallopian tube laid open, all are excellent and clear, as is also a very valuable specimen in which the uterus is laid open, showing a three months' fœtus enclosed in its membranes and still attached.

All of the specimens are mounted in plaster casts, surrounded by alcohol, covered with good, clear glass and made air tight, as nearly as possible. In this manner they may be seen and studied by the students, who are admitted under the care of the janitor.

At the museum connected with Guy's Hospital they have the finest collection in wax preparations, showing the normal anatomy of the entire human body; also casts in wax, of tumors and diseases of the skin, and of other abnormal conditions of the body, in such number and variety as to render it impossible for me to do justice to them. They have here many pathological specimens showing the work of Sir Astley Cooper during his life.

At the Middlesex Hospital, the museum, though not large, has in it many rare and excellent specimens. In wax models the development of the chick and human ovum, also the fœtus, is shown clearly and to the best advantage. There is a large number of well selected casts of tumors of the body; of broken arms and legs, and of tumors of the penis and scrotum.

The models in wax showing the muscles and methods of tying various arteries are very good.

In wet pathological specimens of cysts of the kidneys, hypertrophy of the prostate gland—some of the latter enormous—diseases of the urethra, intestinal canal, showing ulceration, abscess of the lungs, the various kinds of tumors of the vascular, nervous and osseous structures, etc., one can say the collection is simply grand. The wax models showing the various kinds of ulceration, the diseases and tumors connected with the os-uteri, and forms of carcinoma about the face, are of the best. Some very curious monstrosities and hydrocephalic heads, the latter large, and preserved in alcohol, and the dried skulls of hydrocephalic heads, are excellent. There is here a large collection of skeletons and separated pelves, showing rickets, and one very remarkable skeleton of a youth, showing deposits upon almost every bone, the result of periostitis. There is a good number of fractured bones and dried arterial specimens.

In common with so many of the London museums, this has a large collection of vesical calculi, a peculiarity here being some enormous ones from the horse. Here the students are allowed many of the anatomical specimens to study, and the bones of the skeleton are mounted for that purpose, all under the observation of the curator. There is an excellent written catalogue of the specimens, but, as is the case in so many other pathological museums, no printed one.

They have the neatest museum, dissecting and lecture rooms, connected with St. Mary's Hospital, that can be found in all London. The museum is not large, but in complete order, and contains a number of wet specimens of great interest, especially as regards sacculated bladder, with and without stone; diseases of the joints, especially the shoulder and knee; stricture of the urethra and cystic disease of the kidneys. Drs. Jones and Sieveking, the authors of the excellent work on "Pathological Anatomy," were both lecturers in this institution.

At the museum connected with the London Hospital, one of the hospitals with which Dr. John Hutchinson is connected, they have an excellent collection of skulls, showing syphilitic

caries, and specimens of diseases of the liver, perforation and ulceration of the intestines, diseases of the heart, eye, brain and nervous system, bladder, testes, prostrate gland, urethra and various kinds of herniæ. They have a good number of casts, showing deformities of the feet, etc A large number of biliary calculi are shown; one very large stone, removed from the female bladder by dilatation of the urethra; aged 54. A number of models show the anatomy of the ear, and the normal and pathological condition of the ovum and female organs of generation. There are some fine dissections of monstrosities, showing misplaced viscera and points of union; also specimens of fractured bones, and an excellent exhibit of plates showing diseases of the skin, including the new Sydenham Society's publications. There is one plate quite peculiar, in that it goes to show the eruption on the mucous membrane of the stomach in a case of confluent smallpox, the pustules being filled with pus.

In comparative anatomy there is the skeleton of a lion, remarkable in showing a great amount of exostosis of nearly every bone. In this museum there is a great want of labels on specimens. There is a written catalogue, but no printed one.

They have a small but well arranged museum at the Charing Cross Hospital. It contains some fine specimens of enlarged prostate and diseases of the urethra.

The museum of King's College Hospital is very good in fractured bones preserved in spirits, and in diseases of the arteries and veins. I was especially interested in one specimen, that of an aneurism of the middle cerebral artery, the size of a hen's egg. Diseases of the urethra, testes, prostate gland, and of the uterus, are fairly shown. Some fine specimens of calculi imbedded in the pyramids of the kidney. A few good wax preparations, and a number showing distortions of the skeleton, are seen. There is a rich collection in materia medica and botany. No catalogue, and room and specimens very dusty.

In the museum of University College everything appeared in good order. There is a good collection of wax models showing diseases of the skin, and wet specimens exhibiting diseases of the brain, the various joints, bladder, cystic degeneration of the kidneys, stricture of the urethra, and cancerous and polypoid growths of the uterus. The usual number of human monsters and distorted skeletons from diseased bone are shown; also, a large number of vesical calculi, very nicely arranged. There are some exquisite dissections of the arteries and nerves shown here, and a good collection of broken bones. In connection with the cases of disease of the bladder, I heard Sir Henry Thompson remark "that he had never seen but two cases of true scirrhus of that organ." The specimens here showing diseases of the bones and tumors are numerous. There are some fine wet preparations showing herniæ, the inguinal sack and track of scrotal rupture, also fibrinous bands and slits in the mesentery showing internal strangulation of the intestine. There is here quite a wonderful specimen of scirrhus of the thyroid gland, and a number of specimens of gall-bladder, showing gall-stones in situ, besides a case of rupture of the liver that is quite interesting. In the museums I have mentioned there is, as with us, a great want of printed catalogues.

In arrangements and completeness, the museum attached to St. George's Hospital seems to me to rank next to that of the Royal College of Surgeons. It has a very full and complete printed catalogue, the work of John W. Ogle, M.D., F.R.C.S., and Mr. Timothy Holmes, F.R.C.S. I can speak of but one specimen there, and that is the skin of the cow from which Jenner took his first vaccine scab. It is preserved in a room almost by itself, and when we consider that previous to the great discovery of Jenner it was computed that forty thousand persons died annually, from smallpox, in Great Britain and Ireland; that in twenty-five years Europe had lost fifteen millions of its inhabitants by the same disease; and that in this country the ravages had been even more severe; we will not object to give such honor to anything connected with the discovery that gave us a safeguard in vaccination.

Of the great museum of the Royal College of Surgeons, England, and of the Army Medical Museum at Washington, I cannot attempt to speak. The catalogue of each, with that of St. George's Hospital, may be found in our State Library.

The excellent and grand museums in Vienna, Berlin, Liepsic and Paris, I have hardly time to mention.

But to return to our own museum: I have dwelt upon the facts relating to it because of the deep interest I take, and ever have taken, in its welfare. In proof of this feeling I wish to call your attention to the work that has been done, and is now doing, in the extension. During the past year the faculty have put in readiness what was formerly the lecture room of Professors MacNaughton and Townsend. In it I have placed many of my private specimens, to which I shall add others, amounting in all to something

over five hundred. There you will find a complete set of Bock's anatomical models; also all the plates of skin diseases published by the New Sydenham Society, together with many from other sources. In wet specimens are a large number of pathological ones, illustrating almost every form of disease to be met with in the human body, a collection of renal and vesical calculi, and a large number of gall stones. These are to be arranged so as to make them of the greatest possible use to the students. In another year I hope to have the catalogue complete, when due credit will be given, not only to my old students who have assisted me so much, but to all in the profession who have so kindly aided in forming this addition to the museum of the Albany Medical College.

Communications.

VERATRUM VIRIDE AND ITS USES.

BY DR. EDWARD H. SHOLL,
Of Gainesville, Ala.

This article is intended to formulate a comprehensive and consecutive use of this drug for twenty years. What it teaches, carefully considered and acted on, will be of more than passing value to the profession at large, and is worthy of their serious attention.

It is not proposed to give arbitrary rules, but guides to those who are willing to learn from the lessons of experience, for the only successful physician is he who treats the individual and not a name, realizing fully the modifying influence of time, place, and personal idiosyncrasy. In its proper sphere of activity it is a gift of God, and apart from quinine and chloroform, no more useful medicine, in its judicious application, has been introduced during the last fifty years. *Age* is no barrier to its use; its range, in my experience, is from the infant of one month to those of past eighty years. *Dose* runs from $\frac{1}{32}$ of a drop to twelve drops, the last the largest I have ever found necessary to give at one time. *Race* has modified its use, so that, save in puerperal diseases, I never give it to the black in any acute disease, his peculiar physical conformation and ready tendency to depression precluding it entirely where it is found most useful in the white—in diseases of the air passages—post-mortem examination definitely proving the lung of the negro to have but two-thirds of the capacity of the lung of a white man of same weight and height.

Diseases of the Air Passages

will be first noticed. Here the law that governs its use, and from which I record no safe deviation, is, that it must be limited in its application in bronchitis and pneumonia, more particularly in the latter, to the first ninety-six hours of the attack, unless taken prior to that time, when its safe use may be indefinitely continued. It is out of place after the lung has become consolidated by inflammatory product, or its vesicular substance condensed by mucus or other product.

If this law is carefully followed I avouch its safe use, as I have never found but one case where it gave any cause for any unusual care, and in this case the depression was readily relieved.

Its action is that of a depurant, and an equalizer of the circulation, eliminating by the kidney and mucous surface of the bowel, and coordinating arterial action, so as to relieve either visceral or capillary congestion, and bring about an equilibrium.

In acute laryngitis, acute bronchitis and pneumonia, the best method of administration is to give the full dose, according to age, every two hours, till three doses are given, after that prolonging the interval to three hours, and continue thus, with instruction to reduce dose and prolong interval if nausea or vomiting ensues, and as the patient improves. Unless otherwise indicated, I prefer giving it alone, in a little water, so as to complicate its action as little as possible, using a mercurial or other purgative, if required, and an opiate if violence of cough and pleuritic pain at the outset require relief. I never give quinine within three hours before or after administering it, not fancying its combined action, and seldom or never finding any imperative demand for so doing, for in competitive tests, often repeated, I find here, in a region of country malarial from July to October, and impressing its type in the modification of many forms of disease, and where presumably quinine would be most valuable, particularly in pneumonia, that it bears so little value comparable to the veratrum, that I seldom resort to it, and when I have done so, have generally had cause to regret it. The largest dose for an adult, at one time, given as above directed, need seldom exceed four drops. For an infant one year old I give one-fourth of a drop as a dose; at one month one thirty-second of a drop. I would here say that, if anything, I prescribe it more frequently in infants and children, their ready susceptibility to all catarrhal affections demanding its more constant use for relief of their wants.

In those diseases of people advanced in life, I use it steadily, but in smaller doses, ordinarily giving at the same time a tablespoonful of a mixture of equal parts of syrup of lactophosphate of lime and sherry wine, to stay waste and gently stimulate. With the infant I use, in addition, in an aggravated case, mustard to front and rear of chest, repeated as needed, with hot foot baths, and if it be of the croupous variety, small blisters behind the ears.

The common result of this treatment in my hands, in all cases apparently hopeful, is prompt relief of the severe and often distressing symptoms, and a speedy recovery, with a very largely recorded successful result in the great bulk of cases that afford the least probability of a hopeful result.

A sense of rest, trust and repose has come to me in the constant use of this remedy, that nothing else but the certain antiperiodic effect of quinine gives. In leaving my cases thus treated I have long since learned to leave them with as little anxiety as any conscientious physician can do who has the welfare of others entrusted to his care; and this is no light boon to the professional toiler, often harassed and wearied with the necessary burdens incident to his life.

As this class of cases affords the widest and most constant field for the use of the veratrum, it may be best to specify just where it is inadmissible in them, and to define the other methods of treatment which necessarily stand in contrast.

In the intercurrent pneumonia of typhoid fever it is not safe to use it. Recently, in a case of double pneumonia, in a delicate young married lady, coming on in the second week of typhoid fever, the treatment was uninterrupted through the three weeks of its complication, until its entire relief, one tablespoonful of syrup of lactophosphate of lime with five grains of lactopeptine, every three hours, sweet milk, in quantities varying from one to four pints in twenty-four hours, being the sole diet during that time, with an occasional teaspoonful of paregoric, to control undue activity of the bowels, and three-grain doses of oxalate of cerium, to secure quiet rest and control the delirium, as needed.

Again, it cannot be safely used to any extent in cases of pneumonia with the negro; on the contrary, in a large and continuous practice among them for more than twenty-three years, I have learned to limit my remedies in pneumonia, with them, to whisky, Dover's powder, ammonia and quinine, useful in the order named, a common prescription being two tablespoonsful of whisky to an adult every two hours, sometimes increasing it, treating many grave cases, as pneumonia is by far the most fatal disease of adult life to them, with whisky and Dover's powder and good nourishment alone. Experience has taught me that in the administration of quinine in pneumonia, it is best to give all that is to be given during the twenty-four hours, from 15 to 20 grains in the adult, at the hour of lowest temperature, which is usually from 2 to 6 A.M., all at one dose.

I close the reference under this head with noting a variety of pneumonia, that of the steady, square drinker, who carries regularly his pint to a quart of whisky daily. This class of pneumonias here, however, comes exclusively under the domain of the undertaker, as I desire here to testify that the first case of recovery, by any method of treatment known to me, has yet to come to my notice. In my practice they have been in every instance fatal.

Dr. Edwin H. Watts, my former partner, now a leading physician of Galveston, Texas, said to me, that in a medical career of twenty-seven years he had never known a single instance of recovery.

Dr. Josiah C. Nott, of Mobile, justly famous in his day, avowed that in his long and very extensive practice he had seen no recoveries.

Whether this is climatic, as our average rainfall is about sixty inches yearly, or entirely due to the amount and quality of the other kind of moisture, my range of observation does not permit me to say.

Opium Poisoning, Acute and Chronic.

Years ago, through the columns of the REPORTER, I called attention to its value in acute opium poisoning, administered in ten-drop doses of the fluid extract or tincture, at intervals of ten minutes, in the adult. Further experience has convinced me of its value, as being so great that I have rarely believed it necessary to resort to other means.

A much wider and more benign field of usefulness and great good opens up in its pronounced virtue as an efficient and safe antidote in the chronic opium habit. The attention of the profession was first called to its powerful control over this habit by Dr. Giles, a very capable physician of this (Sumter) county, at the semi-annual meeting of our medical society, in October 1877, who had for some time been carefully testing its decided value in five-drop doses, three times daily. Our Secretary, Dr. R. D. Webb, of Livingston, Ala., and late President of the State Medical Society, at its last annual meeting, called the attention of the profession in Alabama

to it, asking their coöperation in a test of its remedial powers.

The evil has grown to enormous dimensions, marring the peace and happiness of many a household. Some of its slaves would willingly break their fetters, and I offer this to the profession of the world at large, and ask that they test this safe and simple method with those who desire to be relieved, protracting its use, as Dr. Giles did, sufficiently long to give it a valid test.

Chronic Valvular Disease of the Heart.

In aortic and mitral regurgitation, more particularly in the latter, with its distressing cardiac dyspnœa, and other attendant troubles, more relief will be found in the careful administration of equal parts of the fluid extracts of veratrum and digitalis, than in any remedies that can be administered. The doses must be tentatively and steadily given to the extreme limit that can be borne. Ordinarily eight drops of the mixture every three hours will suffice to meet the most urgent indications.

Puerperal Diseases.

In the Reporter of July 20th, 1878, I entered into detail on the subject of puerperal peritonitis, where the veratrum was certainly the controlling agent in the successful result of treatment. Several times, more recently in the Reporter of April 12th, 1879, I have called attention to its efficient action in puerperal convulsions in connection with other treatment, and as in severe cases; one I have recorded in a colored woman, where bleeding was inadmissible, there being present a double pneumonia; it, with morphine, brought the case to a happy issue, the woman not becoming conscious till the fifth day; its value here was most admirably developed.

Epilepsy.

I have record of two cases, brought to a successful issue, in one of which restoration to health was complete, in this regard, the remainder of her life. In the other case there has been no paroxysm since 1867. These cases were treated with five drops of fluid extract of veratrum viride, with two grains of sulphate of zinc, three times daily. In one stage of one case the scutellarin was added. My experience here is too limited to be anything but suggestive. It has also been highly recommended in the most violent forms of chorea. Fortunately, I have no personal experience in this disease.

Wounds of the Abdomen.

When the cavity of the abdomen has been entered with a sharp cutting instrument, without any serious lesion of the viscera, but with a severe peritonitis, and the intensest grade of fever possible following the injury, I have pushed the conjoined treatment of veratrum and morphine as steadily, rapidly and fully as could be borne, with the kindest and happiest results, giving here at times the veratrum in ten-drop doses, to combat as rapidly as practicable the violent inflammation. Reasoning from analogy, but not from experience, it is to be supposed that in the judicious use of the veratrum the ovariotomist would find, at times, a valuable addition to his resources.

Vertigo and Apoplexy.

In plethoric vertigo it has been my custom for years past to use it freely. Ordering perfect quiet, in the most comfortable position to the sufferer, ten drops are given at once. The same or a smaller dose is persistently given every three hours until relief is afforded, which is usually the case as soon as the least characteristic effect of the medicine is produced. It is then cautiously continued, due attention being paid to the secretions. In apoplexy with hemiplegia, I have used it freely during the last four years, for as many hours after the attack as were necessary to relieve the unsteadiness and tension of the pulse, with marked and desired results. With this résumé of its action and profitable uses, it is commended to the attention and practical scrutiny of the profession.

RELATION OF TELLURIC AND METEOROLOGICAL CONDITIONS TO MALARIAL DISEASES.

Read before the Williamson Co. (Ill.) Medical Association, October 7, 1879,

BY J. J. FLY, M.D.,
Of Pulley's Mill, Ill.

In order to secure a base for the remarks I propose to make upon this subject, I will give a short sketch of the character of the weather, and associated with it, the degree to which malarial fever and its concomitants have existed at different seasons, in this region of southern Illinois, since 1875. In this description I will not go into the details of minute thermometrical and barometrical ranges, but will give it in a general manner, and mostly from memory.

The winter of 1874-5 was exceedingly cold; many snow storms, and but little rain. The following spring moderately wet and very cool, vegetation being very backward. There was but little manifestation of malaria during this season. After the middle of July becoming very dry, so

continuing until the last of October. The creeks were all dry; wells and springs that were never before known to fail ceased to furnish water; vegetation was parched and withered under the scorching sun, and nearly everybody was sick; often in a family of half a dozen there would not be one found that was able to wait on the others. Intermittent, remittent, typho-malarial, pernicious fever, and dysentery, characterized the prevailing forms of disease. There was some abatement about the middle of October, but a more than usual amount merged into November.

The winter of 1875-6 was very warm and wet. The spring following a few heavy rains, but rather warm, and but very little sickness of any kind. July, August and September was again attended by a "good deal" of malarial fever; these months being very dry, more especially September, which was more sickly than either of the others.

The winter of 1876-7 was very cold, dry and healthy. Spring moderately warm and wet, with but few chills. Summer and fall very warm, but more rain, and a corresponding less amount of fevers.

The winter of 1877-8 very warm and wet; this character of weather prevailing throughout the spring. But little sickness of any kind. The following summer, 1878, is known by its "hot wave," throughout the United States. It commenced here about the 4th of July, and continued throughout August. A drouth intervened soon after hot weather made its appearance, and continued very late in the fall. Pernicious fever, intermittent, and the usual forms of malarial disease prevailed, with considerable mortality.

The winter of 1878–9 was very warm and open until December, when heavy snows and very cold weather supervened, lasting until February, at which time it became warm and rainy.

The spring and summer of the present year has been very healthy; also very dry until the last of June, at which time it began to rain heavily, and has continued to rain every week since that time, the waters in the creeks continually running and overflowing as often as once a week. Vegetation of all kinds at present writing is as verdant as in spring time. The entire season, summer and fall, with the exception of about ten days, has been very cool. We have had less malarial troubles than any year succeeding 1875.

It will be seen, by the foregoing synopsis: 1st. That in the spring and early summer we usually have plenty of rain, and but little malarial fevers.

2d. That in the hot months, when we have least rain, is when these fevers prevail most.

3d. That they prevail more or less in a direct ratio to a corresponding degree of hot and dry weather following a wet season.

4th. That a cool and wet summer and fall, a time when these fevers usually prevail, insures immunity from them.

The above conclusions are the result of experience, therefore palpable facts. And these facts before us furnish a clue that enables us to determine the source of malaria, and under what ground and atmospheric conditions it may be generated. Pure air, pure water, and proper hygienic regulations, cannot result otherwise than in good health. An atmosphere laden with poisonous effluvia emanating from vegetable and animal decomposition, under a proper thermometrical range, will undoubtedly weaken the vital forces; therefore interfere with nutrition and assimilation, ultimating in disease. That foul drinking water, decaying animal and vegetable matter, may envelope us, and be consumed by us as food and drink, without being detrimental to health, seems to be proven by Dr. Rudolf Emerich's experiments, who was "not afraid to"

> "Drink from the gilded pool
> That beasts would cough at."

This dirty, foul smelling, "salmagundi" mixture, contaminated with "dirty rags, hairs of men and beasts, particles of fæces, etc., as the trench was the general receptacle of previous dirt carts, dead cats and the like," that honorable gentleman actually employed as a remedial measure in "constipation, headache, loss of appetite and muscular pains," etc. (Medical and Surgical Reporter, September 6th, 1879.)

But while the crude material of cesspools, in a saturated condition, may be taken into the stomach, go the rounds of the circulation, and be eliminated by the excretions, without prejudice to health, we certainly believe gases arising from them under a July and August sun will propagate malarial fever and all of its concomitants. Endemic diseases cannot be dependent upon any other cause than the peculiar condition of the atmosphere of the locality. An atmosphere that is pure cannot be a factor of disease; as such it must be impregnated with foreign deleterious agents; and they come from no other source than the sea or ground.

This leads us to the point of determining why is it that rainy and warm weather is favorable to health, while dry and warm weather is unfavorable?

In answer to the first proposition of this interrogatory, we must, as has been remarked, necessarily look to the ground and atmosphere.

During rainy seasons, especially winter and spring, the atmosphere is cool, the "ground water" high, and moisture extends to the surface. All debris, either animal or vegetable, is fully saturated with water at a sufficiently low temperature to prevent fermentation, and consequently any noxious exhalation. The atmosphere, from this fact, is free from these intrusions, therefore pure and bracing, which is a most favorable condition to health. In such seasons the temperature of the air is more equal throughout; and to this may be added the allotroptic change of oxygen and ozone, induced by electricity, which is supposed to be a powerful sanitary agent.

The present season, up to this time (September 15th) has been very cool, with the exception of about ten days, just preceding the rainy season, which was extremely hot. At this time the "ground water" became very low, as was indicated by the sinking of the wells in the neighborhood, some going dry. This period was characterized by cholera infantum, which prevailed with considerable mortality, but lapsed into the ordinary form of diarrhœa on the intervention of the rainy season. The "ground water" now arose suddenly; the atmosphere was cooled by the rains, and we had but a small aggregate of malarial manifestations; we can assign no other reason for it than those just mentioned.

The answer to the second proposition, why is it these fevers prevail most in hot and dry weather? throws us upon the same resources as the first, *viz.*, the ground and air.

But instead of running lakes and rills, and a soft and bracing atmosphere, we find dry and parched leaves in the beds of the water courses, and an air laden with the emanations of organic matter, that has been exhaled from decomposing masses on and in the earth. They exist in these localities without being detrimental to health, under a proper cool temperature, but are only waiting for the air to become sufficiently heated to commence the work of fermentation, when they, as "mere chemical agencies, or more probably low forms of life," rise as vapors, thereby becoming the fruitful source of the diseases under consideration. The level of the "ground water" bears a close relation to the prevailing type of disease present. And it is probable that the "under world," ere long, will furnish a solution to the puzzling questions that have hitherto belonged to etiology. "Pettenkofer's observations led Buhl to the discovery that in Munich there was a close relation between the height of the ground water and cases of typhoid fever; the outbreaks of typhoid fever occurred when the ground water was lowest, and especially when it has risen to an unusual height and suddenly fallen."—From a communication by Frank Woodbury, M.D., Attending Physician of the German Hospital, Philadelphia, to the MEDICAL AND SURGICAL REPORTER, August 20th, 1879.

From our own observation, malarial fevers exist more or less in proportion to the height of the ground water and the temperature of the atmosphere; that when the ground water is high, and the temperature of the ground and atmospheric air is high, paroxysmal fevers prevail in the sthenic form; and when the "ground water" sinks, and the air becomes cooler, they assume a lower and more continued form.

But while conditions favoring exhalations or non-exhalations are the prime sources in propagating or giving immunity from these diseases; there is another factor operating strongly in freeing us from the contaminating influence of these poisonous effluvia after they have been evolved. We refer to the diffusion of gases. It is a well known fact that there is a constant interchange going on between the ground and atmospheric air. Gases that will not combine chemically, have the power of becoming intimately mixed. Now, while heat favors decomposition and the attending exhalations, it also induces expansion of gases. By this provision the deleterious effects of these exhalations is weakened by their being intimately mixed, therefore diluted, in a rarefied atmosphere. The facility of the expansion of gases is affected by the different degrees of atmospheric pressure. A high pressure is an obstacle in the way, while a low pressure favors it most. When the soil is damp, the air humid, and the season attended by rain, atmospheric pressure is low. If to this be added a warm temperature, the most favorable condition is afforded to the expansion of gases; consequently the greatest diffusion of noxious effluvia, rendering the atmosphere more pure and healthy.

Myopia and the Color of the Eyes.

M. Nicaté stated, at the meeting of the French Society for the Advancement of Science, that as one of the results of his examination of 3434 eyes in relation to myopia, at Marseilles, this defect was observed far more frequently in light than in dark eyes, blue and gray eyes furnishing 18 per cent., and black and brown eyes only 11.27 per cent.

Hospital Reports.

PHILADELPHIA HOSPITAL.

SERVICE OF DR. E. E. MONTGOMERY.

REPORTED BY JOSEPH MARTIN, M. D., INTERNE.

Laceration of Cervix Uteri—Operation.

Eliza S., aged 21, single, of irregular habits, entered the Philadelphia Hospital June 3d, 1879, and gives us the following history: Always enjoyed good health until the birth of a child, five years ago. Since, has experienced a great amount of pain in the back and lower portion of the abdomen, a feeling of weight in walking, frontal headache, poor appetite, constipated bowels; feels weak and nervous; is quite hysterical and cannot sleep. Menstruation was regular until three months ago, when it ceased. She now has a constant, profuse, thick, yellowish discharge or leucorrhœa. You are well aware this group of symptoms is common to a number of uterine disorders. By digital examination, we find the cervix enlarged, the lower end flattened, hard, dense, presenting the sensation of cartilage, the surface abraded and covered by granulations; the antero-posterior diameter longer than the lateral, and a distinct depression or fissure laterally on each side of the os. The uterus is retroverted, and presents a distinct neck above the expanded extremity.

Placing her upon her side, and introducing Sims' speculum, you notice, at once, the flattened end and the fissures laterally; the whole surface red, abraded and granular. It is quite evident, I think, to all, that we have here a woman in whom the cervix uteri was lacerated during confinement; the lips have been everted and the fissures partly filled up by cicatricial tissue. The dense cartilaginous feel of the cervix is due to the infiltration from inflammatory exudation. This lesion occurs more frequently than is generally suspected. According to Emmet, of the cases that came under his care for uterine disorder, 32.80 per cent. of all who had been impregnated were found to have laceration. During this term I have examined the women one month after delivery, and found that nearly 50 per cent. have had more or less laceration of the cervix. Since the attention of the profession has been called to this lesion by Emmet we find operations probably more frequently performed for it than for any other of the genital organs.

In consideration of the causes, parturition must be regarded the most frequent, though it may occur as readily from malpractice in the attempt to bring about an abortion. In parturition it frequently is the result of rapid labor; the cervix, being rigid and undilatable, is torn through by the severe contractions of the uterus; the early use of the forceps before the uterus is fully dilated is another cause; the attempt to push the cervix over the head and hasten the dilatation of the os, is, I have no doubt, an occasional cause. In eleven cases that have come under my notice, in four was there a history of delivery by forceps. In tedious cases, where the head has been pressed upon a tightly contracted cervix for several hours, or, where a lip has been caught and pressed between the head and a portion of the pelvis, the bruised and congested tissue becomes readily torn by a slight augmentation of force. If the patient remains quiet in bed a slight laceration will unite. In the more severe cases, however, as the woman goes about, the weight of the uterus flattens out or everts the lips of the cervix, by pressure upon the walls of the vagina, and increased epithelial formation, inflammatory exudation and infiltration follow. The surfaces become abraded, and are frequently mistaken for ulceration, corroding ulcer, or the incipient stages of epithelioma. In a case that came under my care last spring, there was a history of frequent hemorrhage, violent pain in the abdomen and back, a profuse leucorrhœa, and loss of flesh and appetite; the patient presented a peculiar sallow look, an anxious expression, and was particularly despondent. Upon examination I found the vaginal portion of the cervix apparently absent, and the lower portion of the uterus covered with exuberant granulations, which broke down and bled upon the slightest pressure. I concluded at once that I had to deal with a disease of malignant character; I made applications of chromic acid, once in two weeks, and painted the surface semi-weekly during the interval with a solution of tannin in collodion. Greatly to my surprise the whole surface healed over, the pain disappeared, appetite and general condition improved; the cervix presented five distinct fissures; this patient would not submit to an operation, believing herself well. It was but a short time, however, before the cervix again became abraded, and the same condition will be developed. These cases can be apparently cured by the use of caustics and astringents for a length of time; but upon a little extra exercise, these cicatricial surfaces of low vitality rubbing against the vagina, become abraded, the old train of ills returns, and the patient goes back to her old medical attendant or to some other, complaining of her former trouble. These patients frequently travel from one physician to another, in the anxious search for permanent relief, and at last give up in utter despair. Is there a physician in active gynæological practice that has not met with such cases?

The increased cell formation and degeneration resulting is stated by Emmet to be a frequent cause of epithelioma at the climacteric period.

The mucous follicles gradually undergo cystic degeneration, increasing the eversion of the lips and the rolling out of the mucous membrane.

As a result of the lesion, the patient has a profuse leucorrhœa, complains of weight and pain in the abdomen upon walking, is weak, debilitated, and loses flesh, from the constant drain. The cicatricial tissue developed, as it contracts, presses upon the terminal nerves, giving rise to neuralgia and all its attendant ills.

Laceration takes place most frequently laterally, in some cases but upon one side. In thirteen cases I have seen but one that showed a laceration on one side only, nine on both sides, one laterally and forward, one laterally and backward, and one laterally and through both lips.

Having described this lesion and declared caustics and astringents ineffectual for its treatment, you will inquire what better have I to propose?

A great advance was made in the treatment

and permanent relief of such cases when Emmet proposed paring the edges of the laceration and bringing the freshened surfaces together. I will now proceed to show you how this operation is done. This patient being fully etherized, we place her upon her left side, with the left arm behind her, in the position for the use of Sims' speculum. By this instrument I readily expose the cervix; hooking a tenaculum into each lip, the two can readily be brought together, completely covering the abraded surfaces and giving the organ a more natural appearance. This is what I propose to accomplish by an operation.

As a first step in the operation the uterus is drawn down by a tenaculum and pierced from before backward, by a needle armed with a strong thread. This thread is hooked down from the cervical canal, cut, and the ends tied, giving a handle for each lip. To prevent hemorrhage, I have constructed a tourniquet, by cutting off the end of a flexible metal catheter and passing through it a loop of strong silk cord. This loop is placed well over the cervix, as high up as the vaginal attachment will permit, the ends drawn tight and tied over the rings of the catheter. I now freshen the edges of the fissures; this is done here with the knife, as the induration is so great that I cannot use the scissors; I remove the indurated tissue freely, particularly that in the angles of the fissures. You can see how admirably this improvised tourniquet serves the purpose, not a drop of blood being lost. The wound is now ready for the sutures. The first, or highest, is introduced from the inside, each end of the wire successively, as I can thus bring the suture further back upon the original surface; the others I will insert from one lip to the other, taking care to go two lines beyond the abraded surface upon each side. Three sutures on each side are all that are needed in this case. The sutures are brought together and held by the compressed shot; this done, you can now observe what will be accomplished by this operation. As I remove the tourniquet the hemorrhage is quite profuse, but as the surfaces are closely approximated it will soon cease. It, however, serves to show you what a valuable auxiliary is this simple contrivance, for without it the whole course of the operation would have been complicated by hemorrhage. I now introduce a plug of cotton saturated with a solution of acid carbolic in olive oil, 1 to 16, which will remain for forty-eight hours; the same dressing will be changed daily during the next three days, after which it will be discontinued, and an injection of a carbolized solution used twice daily. She will be faithfully confined to the recumbent position for the next two weeks, using the bed pan for urination and defecation. Her bowels will be kept open. Diet will be moderate and unstimulating.

28th. This patient is again brought before you, having experienced no discomfort except that of lying in bed. I will now remove two sutures on each side, leaving the one on each side nearest the os for a few days, to strengthen the weakly united surfaces. Union has been as complete as could be expected at this time.

At an examination, about the middle of July, the cervix was found completely united, resembling in appearance that of a virgin; the hard, dense feel of the vaginal portion had wholly disappeared, leucorrhœa ceased, pain absent, and general condition and appearance much improved. She expresses herself as feeling well.

PENNSYLVANIA HOSPITAL.

SERVICE OF DR. R. J. LEVIS.

REPORTED BY GEO. F. SOUWERS, M.D.

Amputation of the Leg—Modification of Esmarch's Bandage.

GENTLEMEN:—You will remember seeing in this arena, some weeks ago, a man suffering with a chronic ulcerated condition of the dorsum of the foot, brought on, as the patient supposed, by exposure, during which his foot was severely frost-bitten; this he tells us took place some four years ago, since which time his foot has been in the condition you see, perfectly useless as an organ of locomotion, and a constant source of annoyance to him. On further inquiry, however, I found back of all this a specific history, and on examining the leg the scars of old rupial ulcers are found, thus throwing additional light on the case. The ulcer has a foul, unhealthy look, and on exploring with a probe, I can penetrate into the ankle joint and come in contact with diseased bone; there is caries, and a general ostitis of all the tarsal bones. I am satisfied that there is but one thing to be done for the relief of this man, and that is to amputate the foot. The experience of surgeons is against cutting through the os calcis, as in Pirogoff's operation, when there is a specific history present, the vitality of the cancellated structure of the bone seemingly not being sufficiently healthy to insure the rapid repair. Some perform Syme's operation, but I do not deem this a good case for such an operation; I think that amputation above the ankle would be better, under the circumstances, as there is thus less chance for the absorption of purulent matter than there is if we go through the more complex structures of the tarsus.

The question now presents itself as to the preferable plan of operation. I have the choice of four varieties—circular, antero-posterior, rectangular and lateral flaps. Of these I prefer the latter, in the lower part of the leg. The rectangular makes a good flap, but there is too much bone sacrificed. Good drainage, enough skin, and not too much muscle, which is liable to suppurate, are the requisites for a good flap. All these qualities, I think, are combined in the lateral flap, especially when cut from without inward. The flaps made in this manner present the further advantage of not bulging, as flaps made on the old plan do, when brought into apposition, and they slope down nicely and evenly to the bone.

The patient being anæsthetized, the Esmarch bandage is applied to the limb, in order to drain the tissues about to be amputated of their blood, and to avoid hemorrhage as much as possible. About this bandage and a modification I have made of it I shall speak later. I now place the patient in position for operation; one assistant, who sits on a chair at the end of the table, supports the patient's foot and ankle in his hands; another

supports the patient's knee. I now take an ordinary heavy scalpel and proceed to fashion the flaps, commencing the incision behind and bringing it in a curved line forward to the crest of the tibia; then I continue the incision on the other side of the leg till it reaches the point of commencement; I now dissect up the flaps till the point at which I propose to sever the bone is reached. The interosseous structures are now severed, the saw applied so as to cut through both bones at once, in order to avoid splintering or fracturing the fibula, and the major part of the operation is completed, the flaps during the sawing being held out of the way by an assistant. The angle at the sharp crest of the tibia is now sawn off, the bleeding vessels tied with carbolized catgut ligatures, the projecting ends of the nerves drawn out and cut off, tendons etc., trimmed down, the lips of the wound approximated by means of metallic sutures, and the wound is ready to be dressed. The wound after closure is washed out thoroughly, by means of injecting a stream of carbolized water, thus disinfecting the tissues and removing all clots and other matter which might have a tendency to prevent union. The carbolized dressing is applied, consisting of lint saturated with carbolized olive oil, in the proportion of one part of carbolic acid to sixteen or twenty parts of olive oil or lard, a waterproof paper applied over all, and around this a bandage, thus completing the dressing.

In regard to the bandage of Esmarch, there is this objection to its use; there is a wide rubber band, which is admirably adapted for the purpose for which it is intended, to drain out the blood from the tissues about to be removed, but to keep up the constriction during the operation, there is provided a narrow circular tubing, intended to be bound tightly around the limb. Now the result of this limited constriction is the production of a paralysis of the vaso-motor nerves distributed to the part constricted; an increased tendency to hemorrhage is thus induced. To avoid as far as possible this result, I have devised a form of constricting band, which I here show you; it consists of a strong flat band, about two inches in width. The ends of this band are strengthened, and several eyelet holes are bored, through which a narrow cord or tape is passed, and by means of which the ends of the bandage are fastened. The advantages of this bandage are the avoidance of linear constriction, and the decreased liability of producing paralysis, the pressure being distributed over a greater extent of surface.

Editorial Department.

Periscope.

The Throat in Tuberculosis.

Dr. F. C. Wilson says, in the *Medical Herald*—

It is surprising how little attention is paid to the laryngoscopic examination of the throat in suspected tubercular cases. Perhaps this may be due to the popular belief that the invasion of the throat by tubercular deposit is a complication of the last stages of the disease. It frequently happens that the throat is the first point involved, and the changes discoverable by the laryngoscope precede the manifestations in the lungs as detected by a most careful physical examination. A familiarity with the earlier changes in the throat may sometimes enable us to detect the development of consumption long before the condition of the lungs would require an examination. Much valuable time, and time, too, perhaps essential to the saving of life, might thus be gained. Among the symptoms which should attract the attention and suggest an examination of the larynx may be mentioned the following:—

First, the change of the voice, during a conversation, from a hoarseness to a high falsetto and then to a whisper.

Second, a frequent desire to clear the throat, causing a short, dry, hacking cough.

Third, difficult deglutition, either from impaired mobility of the thickened epiglottis, allowing substances to pass into the larynx, or from the great pain caused by the movement of the parts.

The first appearances, as far as diagnosis is concerned, are of most importance to us. The paleness of the mucous membrane described by Sawyer is not a simple anæmic condition, for the color is rather a muddy-grayish hue, and many congested capillaries are apparent, frequently producing a scarlet hue, sometimes even livid. The epiglottis soon becomes more or less thickened and tumefied, frequently much misshapen. The thickening is not a simple œdema, but an actual infiltration and tumefaction of the submucous tissue.

When ulceration occurs it may be either in simple superficial erosions, or more frequently in deeper ragged ulcers, with overhanging edges, and extending to the deeper structures, sometimes even perforating the cartilages. When sloughing and ulceration of the epiglottis occurs, it is almost always upon one side of the median line, in a diagonal direction, following the course of the little arterial twig supplying the tissues. The loss of substance occurs, too, upon the side corresponding to the diseased lung. The fearful condition of the poor patient who has such a mutilated epiglottis can hardly be depicted. He can swallow neither liquids nor solids without excruciating pain, and the torture is so great that he will actually starve himself to death rather than make the attempt. Nature can make no successful effort at repair of the rent, for hundreds of times each day, or whenever even saliva is swallowed, the raw edges of the slough are drawn apart, effectually preventing any effort at healing.

Puncture of the Intestines for Intestinal Obstruction.

Dr. W. A. Broadbent, of London, has an article on this subject in the *British Medical Journal*, September, in which he says—

I have recommended and practiced puncture of the intestine several times in intestinal obstruction, and have never seen injurious effects. The precautions which I consider necessary are the following:—

1. To secure, if possible, absolute freedom from peristaltic action of the bowel. This is done by giving an extra dose of opium by the mouth, or a considerable hypodermic injection of morphia, or both, three or four hours beforehand. No food of any kind should have been taken for some time.

2. To select, if possible, a coil of intestine which shall contain only gas, and not liquid. This will be in the jejunum, and is to be found above the umbilicus rather than below it. An indispensable condition is, that scarcely any food shall have been taken during the entire attack.

3. To pierce the coil exactly at its most convex part. The abdomen should be carefully watched for some time at every visit, and especially before the operation. In some cases, where the walls are thin, the outlines of various coils may be traced, even in repose; but this will be more distinct when peristalsis is provoked by pressure, friction, or manipulation of one kind or another; it will be seen also, which coils shift and which keep the same position when contracting. The spot chosen for the puncture should be as nearly as possible over the centre of a coil which does not roll about, and by preference in the linea alba. If the needle happen to hit the line of contact between two coils, it may tear both.

4. To exercise great care and patience during the escape of the gas. The needle should be held lightly, but rather firmly, perpendicular to the abdominal wall, and should not be allowed to follow too readily any movement of the intestine. Under the circumstances of obstruction, the respiratory movements are not great. As the gas escapes from the coil selected for puncture, it will collapse under pressure from neighboring coils, and the flow through the needle will cease; very soon, however, the air in the intestine will distribute itself and enter the empty portion, when it will again escape. This may be aided by gentle manipulation and pressure; but they should not be hastily resorted to; nothing is gained by hurry. Should the tube get blocked, aspiration may free it; but it is safer to drive a little air through the tube into the bowel than to exert powerful suction, which may draw the mucous membrane against the sharp needle.

It is better not to put on a bandage after the operation.

Puncture of the intestine can relieve obstruction only very rarely, and under exceptional circumstances. In the case related, in which there was reason to suppose that the cause of obstruction was external to the bowel, and was due to pressure by the tumor, or by adhesion, or to displacement and dragging of a portion of intestine, it was hoped that removal of distention might permit the parts to return to their previous condition and situation; and other conditions may be imagined in which this might occur, but it could have no effect on a stricture or intussusception. My own experience, however, would lead me to recommend puncture as a palliative; and though I have no experience to guide me, I should think it might be a useful preliminary to inflation, manipulation, suspension head downward, or other procedures in intussusception, twisting, or imprisonment of the bowel by adhesions.

The Treatment of Ophthalmia Neonatorum.

On this subject, Dr. C. Lundy writes to the Detroit *Lancet*, October:—

No absolute rule of treatment can be laid down which will apply in all cases, for certain ones will present conditions peculiar to themselves, and the practitioner must use his own judgment in their management. In the first stage, cold applications, made with proper care, will be useful in a majority of cases, while others derive little or no benefit from their use. Indeed, I have seen very happy effects from warm water applications in this stage of the disease. However, before they come under observation a majority of cases will have reached the second stage of the disease, which is indicated by the mucopurulent or purulent character of the discharge.

Then it will be necessary to cleanse the eyes thoroughly once in two, three or four hours, in a majority of cases, and in some instances they may be cleansed less frequently. The edges of the lids should be kept well anointed, in order to permit the free escape of the secretions, which may be wiped off with a piece of soft linen cloth from time to time. This is an important part of the treatment, and should be attended to with care. To the everted lids, after the eye has been thoroughly cleansed, applications of nitrate of silver, grs. 3, 5 or 10 to the ounce of water, may be made twice daily; or the mitigated stick (argent. nitrat., one part, potas. nitrat., two parts,) may be applied once daily, care being taken to wash off the latter. As the discharge grows less and the inflammation begins to subside, the applications may be weaker or they may be used less frequently. Other remedies may be used, either alone or in conjunction with these, but the foregoing will meet the indications in a vast majority of cases.

Phytolacca Decandra in Mastitis.

Further evidence of the value of this plant in mammary inflammation is given in the *Medical Biweekly*, Sept. 27th, by Dr. Wm. F. Holt, of Ga. He gives this case:—

On the night of November 12, 1876, I was called to see Mrs. A. B., in labor with her third child. Nothing unusual occurred, and on the following morning the labor successfully terminated. On visiting her the third day my attention was directed to the hard and painful breasts; her mind filled with gloomy forebodings, as she informed me that in both of her previous confinements they had caused her intense suffering, and had to be lanced several times, and that her convalescence was slow and tedious. Upon examination, I found both glands filled with several

hard nodules, and very painful. She stated that previously she had used various plasters that had been recommended, and that belladonna, both in the form of ointment and the fluid extract, had been used. I at once ordered her to take five drops of the fluid extract of phytolacca decandra every three hours, until its constitutional effect was produced, and then to suspend its use, or lengthen the intervals. I confess that my faith in the remedy was not very great, but it was the only one at my command. She faithfully carried out my directions, and in a few days all traces of the inflammation had disappeared. The same lady was confined again in 1878; the same symptoms presented themselves, and were again promptly relieved by the phytolacca decandra, administered as before. I could produce several more cases from my note book, showing the good effect of the remedy, but as *all* were attended with similar results, I deem it unnecessary.

Dr. Chas. H. Hall, of this city, informs me that he uses the fluid extract as a local application to the gland in addition to giving it internally, and that it rarely disappoints him in arresting the inflammation.

In this connection I would remark that the most reliable preparation I have used is the fluid extract (from the fresh root).

The Use of the Cold Bath in Enteric Fever.

Dr. Alexander Collie, Medical Officer to the Homerton Fever Hospital, writes, in the *British Medical Journal*, Sept. 20:—

A study of the papers of Professor Liebermeister and others, on the use of the cold bath in the treatment of enteric fever, led me to try it on the cases which came under my care in the Homerton Fever Hospital. I have given, personally, one hundred baths, some in severe, others in moderately severe, cases, taking as my guide not the temperature, but that *plus* the patient; for in this relation, as in others, patients vary much; the temperature with which one man may be highly delirious another bears with comparative equanimity. In the administration of our baths, then, we had regard less to the temperature than to the age, the state of heart, restlessness, and sleeplessness, and chiefly to the last. If the patient had not slept for two or three days, even if the temperature fell short of 103°, he was wrapped in a flannel dressing gown, and placed in a bath of 70° Fahr., gradually reduced to 60° in from ten to fifteen minutes, at the end of which time he was removed to bed, wrapped in a blanket. In nearly all the cases we thought it prudent to give some stimulant to the patient in the bath, from noting that its effect was to weaken the pulse, which fell but a few beats in frequency, and became thready, compressible, wavered, and sometimes almost disappeared. It required resolution to proceed with the bath in such circumstances—circumstances pointing to impending collapse, a result which occurred in two cases. The general effect of the bath was to lower the temperature, taken *per rectum*, two to three degrees at once, and for about three-quarters of an hour after the bath it continued to fall, about which time the maximum fall had been reached. It then began to rise, reaching its former height in periods varying from one to several hours. In a large number of cases sleep followed, varying from half an hour to two or three. The general conclusion formed of the value of the bath was that, in the milder cases and in some of the severe cases in the early period of the disease, the bath given once or twice daily was a useful way of relieving the discomfort produced by the heat, of allaying restlessness and producing sleep; that, beyond temporary relief of symptoms, it had no effect on the course of the disease or on the general mortality; and lastly, that in severe cases the remedy was inadmissible, owing to its depressing effect on the body generally, to the exhaustion which its administration entailed; but above all, for its definite and marked effect upon the circulation, which is invariably greatly weakened. In other words, that the bath was useful in relieving symptoms in those cases whose natural termination is recovery; inapplicable, by reason chiefly of cardiac weakness, in those cases whose natural termination is death; that is, in the cases in which specific treatment is needed. The depressing effect of the bath has been noticed by Professor Liebermeister, who considers a very high degree of cardiac weakness an important contraindication. What, exactly, may constitute such a condition, will be differently estimated by different persons; but it may be inferred reasonably that one who has been the subject of a fever whose definite and specific effect is to produce, and that rapidly, some kind of muscular degeneration and death by asthenia; one who has, let us say, passed ten days without sleep and with little or no food, is a person whose condition generally is one of weakness, and whose heart in particular is weak in a very high degree. What might be inferred, a look at the patient shows at once. He lies prostrate, unable to turn on his side or help himself to a drink, the impulse of his heart gone, the first sound inaudible, and the pulse quick and feble; in short, in a condition of exhaustion. Such a person, I submit, is one in whom there is a very high degree of cardiac weakness. To put the case briefly, those severe cases in which there is every probability of a fatal result from bodily weakness and severity of disease are not cases in which the "antipyretic treatment" is admissible.

The Treatment of Syphilis.

Dr. Brandis, of Berlin, says the *Practitioner*, is an entire adherent to the method of treatment by inunction in cases of syphilis, and he especially recommends it for children; he would also employ it in induration previous to the onset of the general symptoms. Dr. Brandis goes minutely into the question as to the time for making the inunction, and his rule is as follows: So long as the healing of a syphilitic affection progresses under the use of mercury this treatment should be continued, and other remedies should only be employed when the favorable action of the drug ceases. The length of time required for the saturation of the system, and when that point is reached, the interval which must be allowed before the inunction can be again returned to, depends so much on the idiosyncrasy of the patient, that no rule can be laid down beforehand. In the majority of cases, however, the

mercurial treatment can be adopted again after an interval of one or two weeks.

The Hypodermic Use of Morphia in Choleraic Diarrhœa.

Dr. Wm. Hardman, of Blackpool, writes to the *Lancet*, September 27th—

I have now followed this treatment as a part of my ordinary therapeutic routine for about three years, and have never found it fail in a single instance. A good many times during that period I have been called to people who, after vomiting and purging a various time, have been cold, livid, voiceless, almost pulseless, with blue lips and glassy eyes, cramped all over, and with the watery dejections running almost constantly, involuntarily, from them. I have given a hypodermic injection of half a grain of morphia, and in ten minutes the purging has ceased entirely, and recovery has ensued. Often purging is instantly stopped, not a single evacuation occurring after injection. At the utmost there will not be above one or two, which will occur in the ten minutes following. To the patient the change wrought in his condition seems nothing short of miraculous, and I say deliberately that in the whole range of medicine there is no one deed so gratifying to both patient and practitioner as the administration of a hypodermic injection of morphia in choleraic diarrhœa. The vomiting often persists for twenty-four hours, or so, afterward, but may be safely left to subside of itself, as all the danger is due to the purging.

Every now and then the practitioner will meet with a case where, after having given a hypodermic injection of morphia, the purging returns in a few hours. He may safely affirm, in a case of this kind, that the disease will turn out to be dysentery, though at the time the motions may be copious, pale, and watery, and not present the least resemblance to the usual discharges of dysentery. They will with certainty ultimately assume the dysenteric character, and other remedies may be at once tried, as opium and morphia possess no curative power over dysentery. It may be mentioned that the injection of as much as half a grain of morphia in choleraic diarrhœa is hardly ever followed by sleep, but a sensation of indescribable comfort and ease soon diffuses itself over the patient. As a rule, unless the patient be in a really critical state, a quarter to a third of a grain is ample; but if he is cramped, and signs of collapse appear, half a grain may be at once given without the least fear.

I will not encroach upon your valuable space with a description of a series of cases of a disease familiar to every practitioner, but merely end this communication by a summary of my conclusions, which are as follows:—

1. Choleraic diarrhœa can always be immediately stopped by the administration of morphia hypodermically.

2. If severe diarrhœa have persisted two hours, in spite of the administration of opium or morphia by the mouth, frequently, the hypodermic injection of morphia should be at once resorted to.

3. If cramps and collapse be present, the purging persisting, no time should be lost in administering morphia, subcutaneously, in full doses.

4. The treatment is absolutely free from danger, even if temporary suppression of urine or albuminuria be present.

5. Where not curative, the treatment is diagnostic, enabling us to foretell with certainty the advent of dysenteric symptoms.

6. The best preparation of morphia for this and other hypodermic purposes is the sulphate, on account of its smaller liability to undergo change into apomorphia.

Reviews and Book Notices.

NOTES ON CURRENT MEDICAL LITERATURE.

——The *Atlantic Monthly* continues to rank as one of the very choicest of the literary monthlies. The last number has a series of articles of the most creditable character, and the reviews of books, both foreign and American, serve to keep the reader acquainted with the leading productions of our literary men in a very satisfactory manner.

——The eighth part of the Atlas of Histology, by Dr. E. Klein and Mr. E. Noble Smith, takes up the subjects of blood vessels and lymphatic glands. It includes the structure of the heart, the development of capillaries, of lymph follicles, and other matters kindred thereto. The engravings are excellent and the text clear. For sale by J. B. Lippincott & Co., Philadelphia.

——In a reprint from the New York *Medical Journal*, Dr. Putnam Jacobi examines the question of the "sedative" dose of calomel. This is stated to be 15 to 20 grams and not larger, and the best method of its administration that it be placed dry on the tongue or rubbed into it. The indications are precise, and it should not be used unless these really exist or justify so heroic a remedy.

——The address of Dr. C. H. Todd, President of the Kentucky Medical Society, is upon the higher medical education, which he earnestly endorses, and calls especial attention to the fact that it is not merely or mainly teachers in colleges, but prominent practitioners everywhere, who have the power to secure it. As he says—

"Let the leading practitioners realize the fact that upon them devolves the duty of securing these great objects, a higher medical education and the enactment and enforcement of proper sanitary regulations. Let them prove themselves worthy of the great trust which they have accepted, and we will soon welcome the day when the Art and Science of Medicine will stand

above all other professions and sciences, in effecting its grand mission, of promoting the comfort, relieving the afflictions and increasing the usefulness of human existence."

——The Annual Report of the Vital Statistics of the City of Providence, prepared by Dr. Edwin M. Snow, gives a ratio of births, marriages and deaths to population, as follows:—

One birth in 38.44, or 26.01 in each 1.000.

One person married in 49.70, or 20.12 in each 1000.

One death in 50.78, or 19.69 in each 1000.

The average annual rate of mortality in Providence during the 24 years, from 1855 to 1878 inclusive, has been less than 20 in each 1000 of the population. This rate is very small for a city of the size of Providence.

——Dr. Samuel A. Jones, Professor of Materia Medica, on the homœopathic side of the University of Michigan, has had published a little book, entitled "The Grounds of a Homœopath's Faith," three lectures before a class (Bœricke & Tafel, New York City). It is chiefly made up of quotations, and presents no other grounds than those which have been undermined, washed away and dissolved long since, by scientific criticism. It is well that he calls it "faith," which is defined to be "belief without knowledge," or "a belief in things not seen."

BOOK NOTICES.

Winter and its Dangers. By Hamilton Osgood, M.D. American Health Primers, No. VI. Lindsay & Blakiston. Price 50 cents.

The appearance of this work is timely, coming almost with the first frost. The author speaks at all needed length on errors in dress, carelessness in bathing, in ventilation (or, as he calls it, with an affectation not in the best taste, and quite inaccurately, "pulmonary food"), neglect of exercise, the dangers of school life, and several allied topics. The style is agreeable, enlivened by numerous anecdotes, here and there with visible effort, indeed, but on the whole, very readable. We are glad to see that he has the courage to register a doubt about the propriety of the Turkish bath, and wish he had spoken far more decidedly. It is an exotic interloper, wholly unsuited to our climate and character. In conclusion, we must say that, while officially sympathizing with and endorsing the excellent and minute advice this book contains, we are obliged to whisper to ourselves that anybody who carried out the care of his own health to the fine point suggested would be a thought more unbearable to live with than Dickens' famous characters, Mr. Coddle and Mrs. Coddle.

Diseases of Women. By Lawson Tait, F.R.C.S. Second edition. Wood's Standard Medical Library. 8 vo., pp. 192.

Mr. Tait is a careless writer, whose style is unpolished and his arrangement indifferent; but he is a man of sound sense and great experience, and in spite of his manner, he attracts by the decision of his sentiments and the closeness of his observation. How refreshing it is, for example, to find a specialist in his branch who boldly advocates sound general instruction to girls in the hygiene of the sexual life. He is almost the only one we know who has had the courage to do so. "It is a sad misfortune," he observes (p. 29), "that all sexual questions are so completely hidden from children at puberty that they are driven to make discoveries for themselves." He also condemns the convent-like seclusion of girls' seminaries, and says, "it is a mischievous plan to draw wide barrier lines between the sexes in youth" (p. 126). "It is the duty of every parent to give to every child instruction in the nature and purport of sexual function" (p. 91).

Some of his observations are most important in a medico-legal view, especially those showing the inexplicable precocity and atrocity of girls, some not over ten years of age, who have accused men of rape, and gone into all the particulars of the act, when it never took place, nor had a shadow of foundation (p. 28). An interesting statement he makes is, that the popular idea that suckling the child tends to prevent conception is erroneous (p. 65). Is this so? Certainly, the majority of obstetricians think otherwise.

The work should have had a fuller index, and the cuts are poor.

Students' Aids Series. Aids to Anatomy. By George Brown, F.R.C.S. Aids to Therapeutics and Materia Medica. By C. E. A. Semple. Aids to Forensic Medicine and Toxicology. By W. D. Hemming, M.R.C.S. New York. G. P. Putnam's Sons. Price 50 cents each.

On a previous occasion we have noticed this series, when they were first introduced to the American public, several years ago. They have met with good success in England, but experience has convinced us that they are not adapted to the courses of instruction in this country; and we do not believe they will be of much advantage to students.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Half-Yearly Compendium of Med. Science,	2.50
Reporter and Compendium, - - -	7.00
Physician's Daily Pocket Record, - -	1.50
Reporter and Pocket Record, - - -	6.25
Reporter, Comp. and Pocket Record, - -	8.25

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,
115 South Seventh Street,
PHILADELPHIA, PA.

THE RELATIONS OF PHARMACY AND MEDICINE.

A correspondent of this journal recently remarked that one benefit which young physicians derive from keeping on hand and dispensing their own medicines was that they thus secure a practical familiarity with drugs, which they could not obtain in the course of ordinary medical education.

This is no doubt true, and it is to be regretted that with all the advances in modern medical education less and less attention is constantly paid to pharmacy in the regular course. The time was when it was believed that a year in a drug store was time well spent by the young man expecting to become a physician. This is so no longer, and the student who reads in a city physician's office, pursues the ordinary curriculum, passes a year in a hospital and enters private practice, has almost no opportunity to learn to recognize drugs when he sees them, let alone to familiarize himself practically with their pharmacal properties.

Much of the indifference to therapeutics arises from this fact. Elegance and accuracy in writing prescriptions are little attended to. A foolish fear of polypharmacy, and the popularity of the example of the homœopathists in prescribing according to their law of the single remedy, have acted to discourage the use of well balanced prescriptions. What, no doubt, adds to this, is the extension and development of the arts of the pharmacist and his proprietary remedies. The latter are palatable, numerous, and suited to almost any case. Hence, as was satirically remarked before the Academy of Medicine of Paris, by Dr. CHATIN, in a recent discussion—

"Thanks to the enterprise of wholesale druggists, a host of *elegant* preparations are always at hand, which relieve the scientific *clinicien* from the ridiculous absurdity of writing a useless formula. Now that diseases are allowed to run their normal course under the watchful eye of the medical naturalist, the exhibition of an inert but *elegant* granule must be considered a vast improvement upon the active interference of our physicking forefathers."

In the last address of the President of the British Pharmaceutical Conference, Mr. SCHOCHT, he drew the attention of his hearers to the questionable propriety of this disunion of the medical and pharmaceutical professions, and the injury it does to each, although confessedly associated with advantages to the latter. His words were—

"The very circumstance that appears to stamp pharmaceutical progress as unique, and to give it a special dignity—I mean its self-originating and self-sustained character—has largely tended to limit all knowledge of it to those who have specially watched the phenomenon or taken part in it. The policy of those who initiated, as of those who continued the effort, was one that all can respect for its independence, but which I cannot but fear time and experience will show to have been in this important respect unwise. It has served to intensify isolation where unification should prevail. The withdrawal of ourselves and our educational processes from the general professional ken has tended to encourage the elimination of the sciences we specially cultivate from the complete medical curriculum, and to foster the notion I have already deplored, that they are accessories of inferior value, and non-essential to medical culture. For this we must still bear our share of the blame.

"But wheresoever the blame should chiefly lie, I think that the fact of the practical isolation of pharmacy and its professors from the rest of medicine is due to the general defective acquaintance on the part of the professed medical man with both our subjects and our men."

One of the consequences is that the necessity

and the art of making medicines palatable are not sufficiently appreciated by physicians. It has been well observed by a recent writer on diseases of children that this is not only a question of taste; it is in very many cases one of the utmost utility. It is important for the physician to choose those medicines which are not only likely to prove beneficial, but which are readily taken by patients; for even valuable remedies may prove injurious by force or effort being required to enable them to be swallowed. They are, in consequence, either not given at all or only partially, while the excitement induced by their being forced often mars their usefulness. In no diseases is this more likely to occur than in those of an inflammatory character, requiring gentle and soothing remedies.

We should welcome, therefore, the efforts of the pharmacist in presenting agreeable and active combinations, but we should not repose entirely on his skill. A particular and practical familiarity with the qualities of articles of the materia medica and the processes of pharmacy will lead to the discovery of effective combinations and a confidence in the power of drugs which is now absent from many minds.

Notes and Comments.

Therapeutical Notes.

BORACIC ACID IN ECZEMA.

Dr. E. Kurz, of Florence, Italy, recommends

℞ Acidi boracici, 5 parts.
Unguenti petrolei, 5 to 10 parts.

Apply once or twice a day, in eczema, impetigo and prurigo.

SALICYLATE OF SODIUM IN CHOREA.

The *Bulletin Général de Thérapeutique*, 1879, contains a report of a case of chorea in a girl, aged ten years, under the care of Dr. Dresch, in which he used the salicylate of sodium, in the dose of a drachm and a half per diem. At first the medicine was rejected by the stomach, but after two days was tolerated. The exhibition of the medicine was, according to the report, followed by total cessation of the choreic movements and complete recovery in eight days.

CARBOLIC ACID SPRAY IN WHOOPING COUGH.

In the October number of the *American Journal Medical Science*, Dr. J. Lewis Smith reports very favorable results from inhalation of the following spray:—

℞ Acidi carbolici, ʒ ss
Potassii chloratis, ʒ ij
Glycerinæ, ʒ ij
Aquæ, ℥ vj. M.

To be used through a steam atomizer, three times daily, two to five minutes at each sitting.

Dr. Smith does not seem to be aware that Dr. Burchardt, of Berlin, employed this method about five years ago (see Cohen, *on Inhalation*, p. 155).

BISMUTH IN DYSENTERY.

In the *Lancet*, October 4, 1879, Dr. E. P. Houghton recommends—

℞ Bismuthi subnitratis.
Pulveris acaciæ, āā ʒ ss
Aquæ frigidæ, ʒ ij. M.

For a rectal injection, one to three times daily. This relieves the tenesmus and tormina in a very short time. In addition he gives ipecac., ℈ j—ʒ j, at intervals of eight to twelve hours, when the rectal symptoms are urgent. He has tried this treatment successfully in hundreds of cases.

Forms of Scarlatinal Poison.

Dr. D. P. Allen observes, in the Boston *Medical Journal*, that the following propositions can be abundantly established by observations and cases of the most reliable medical writers: 1. That during the prevalence of scarlatina there may occur cases of sore throat, both in those who have previously had scarlatina and in those who have not, and that this may be the only manifestation of the disease. 2. That these cases of sore throat without rash may communicate true scarlatina to others. 4. That scarlatina anginosa may be complicated by diphtheritic exudation. 4. That the period of incubation in many well-authenticated cases has not exceeded twenty-four to thirty-six hours. 5. That a patient in the first stages of the disease is capable of communicating it to another.

Intermittent Hemorrhages Caused by Malaria.

At the French Association for the Advancement of Science, M. Massart spoke on this topic. He quoted a curious case that had recently come under his observation. A lady who had had a tooth extracted by him told him, two days after the operation, that she had lost a great quantity of blood by hemorrhage soon after. Two days later she had another hemorrhage, and in spite of all his efforts to arrest it, another very considerable hemorrhage took place after an interval of two days more. Struck by the periodical

recurrence of these hemorrhages, M. Massart prescribed sulphate of quinine, and the phenomenon ceased.

During the discussion which followed, M. Castan observed that similar cases occurred very frequently in Montpellier.

M. Baréty said that he had frequently observed pulmonary and uterine hemorrhages of miasmatic origin. The pulmonary hemorrhages differed from hemorrhages that were determined by some other cause, both at their onset and end. The blood began to flow suddenly, without any premonitory blood-spitting or taste of blood in the mouth, which symptoms always, as a rule, preceded or followed pulmonary hemorrhages in tuberculosis. He added that, in all such cases, there were more or less slight symptoms of affection of the apices in the lungs.

Antidotes to Poisons.

Quoting from the *Pharm. Centralblatt*, the *American Journal of Pharmacy*, October, says:

Jandousch's general antidote for metallic salts consists of a mixture of iron sulphate and magnesium hydrate. As a certain preventive of phosphorus poisoning, if administered immediately, he recommends an emetic consisting of 0.8 gram cupric sulphate, and as a reliable antidote for carbolic acid, a mixture of 1 part calcium hydrate and 3 parts of sugar.

Hager considers freshly precipitated sesquioxide of iron an equally efficacious antidote for phosphorus, and also suggests the immediate administration of an emetic consisting of 1.0 gram cupric sulphate, followed by 0.5 gram of the same emetic every five minutes until the patient vomits, in case of poisoning with hydrocyanic acid or potassium cyanide.

The strychnia antidotes are very numerous; tannic acid, chloroform and chloral hydrate, in connection with emetics, however, appear to be most reliable.

Subconjunctival Entozoa.

Under this title, Dr. Fienzal has published, in the *Gazette Hebdomadaire*, September 12th, a paper which he read at the recent congress at Montpellier, giving an account of two cases of subconjunctival hydatids that he has met with at the Clinic of the Hospice des Quinze-Vingts, of which he is senior physician. One of these occurred in the person of a girl sixteen years of age, the cyst containing the *tænia echinococcus* having formed amidst the fibres of the rectus externus, producing a tumor as large as a chesnut. The other occurred in a girl three years of age, and consisted in a tumor the size of a nut, placed between the insertions of the rectus inferior and the rectus internus. On the extirpation of the tumor a vesicle the size of a cherry was removed intact, containing a *tænia solium*.

Lactation by Males.

The existence of the mammæ in the male is a striking example of the conservation by nature of useless parts—merely out of habit, as it were. Physiologists record various examples of actual lactation by males, to which one has been recently added by Dr. Krieger (London *Medical Record*). He reports a peculiar case of "gynæcomazia" which came under his notice some time ago. The patient was a boy, aged 7, who complained that his breasts had begun to swell for some time past, and that a fluid dropped from them. The history of the boy was good; there was nothing abnormal in his outer appearance. The breasts had been swollen during the previous week, and the secretion had oozed out of them. The boy's general health was not impaired by this phenomenon. On examining his breast, it was found that the mammæ resembled those of a girl aged 13 or 14. They were slightly pointed, the skin being very thin, delicate, and transparent. There were no long hairs on them. Both papillæ were small and flat. Beneath the right papilla was a tumor of the size of a Spanish nut; beneath the left another tumor as big as a walnut; both were covered with small nodules, and not painful to pressure. On pressing the papillæ slightly, or even when they were not subjected to pressure, small drops of a milky liquid oozed out of them. The fluid was alkaline, had a sweetish taste, and exhibited under the microscope a small number of milk globules and epithelium from the milk glands. The fluid oozed out, more or less, continually. No treatment was undertaken.

On Bark Splints.

Dr. Bettelheim, of Berlin, says that for several years he has, in treating fractures, used splints made from the bark of branches of cherry and plum trees. The bark is peeled off in autumn, from the green branches, and kept till used. Before the splints are applied, they are put into hot water for about a quarter of an hour. In this way they become quite soft, and may be twisted into any particular form, which they retain after having grown cold and hard.

Why would not the spruce bark of our northern forests be better than either of those here mentioned?

Sulphur in Diphtheria.

This was originally suggested by an American physician, and has been warmly advocated by Dr. J. A. E. Stuart, of New Brunswick. In the October number of the *Practitioner* he gives some further results of his experience, in these words:—

Since writing the former paper on this subject, I have treated several cases in the same manner, and with like excellent results. I now find that to rub the sulphur up with a little water, and apply it on a swab to the throat, is the easiest and safest method of application, for in blowing the dry substance on the throat it was sometimes not so easy to get it on the desired spot, and besides, the patient, especially if a child, was very apt to cough up sputa in your face, a most dangerous proceeding. In addition to this, I am of opinion that the moistened sulphur sticks better to the throat than the dry substance, and this is, I think, the advantage which a solid antiseptic has over a fluid, viz., that it exerts its action for a longer time, and this, I think, is also in favor of the method of treatment, where powdered benzoate of soda is blown on the throat.

In using sulphur præcipitatum we get a substance which, being free from grittiness, is more agreeable to the patient. To show the rapidity with which the disease disappeared when treated in this way, I find that of six cases under this method successfully treated, the average number of visits required from me was 2.5; an extraordinary statement, but one which is perfectly correct.

Correspondence.

Case of Hydrophobia.

Ed. Med. and Surg. Reporter:—

June 4th, 1879, Captain O. F. West, aged about 45, noticed a strange dog about his yard for several days, drinking the slop from his hog trough, and several times hissed his own dog on him, and ran him away from the premises; on the unfortunate morning above he was in the yard dividing the food thrown out for his own dog, and they soon began to fight over it; the Captain ran out, intending to kill the dog, when the dog made at him; he, catching at him with his left hand, received a wound in the hand near the wrist, the teeth piercing the flesh; he then killed the dog on the spot. The same dog bit a number of dogs in town, none of which have as yet shown hydrophobic symptoms. The wound in the hand healed up kindly in a few days, and no more attention was paid to it.

September 16th, the Captain was taken sick while in a political meeting and had to go home; he sent for Dr. O. H. P. Slaton, who found him strangely affected, with sick stomach, and vomiting a viscid, bluish fluid; had strange vertigo; would vomit on opening his eyes. Gave him some medicine to cleanse what he considered a foul stomach. His bowels were very hard to operate on; his tongue was heavily coated with a white coating; he suffered with a dull heavy pain at base of brain, running down the spine and was very nervous, especially at night; treatment seemed to relieve most of these symptoms, except an inability to control his head; he frequently asked his wife to raise it for him, and after he was able to walk about the streets he had a continual pain at the base of the brain, and said his head felt too heavy and he could not see well. I prescribed, for this feeling, gelsemium tincture, five drops every four hours; that seemed to remove it for a time, but soon lost its effect. On the 10th of October the pain became worse again, with sick stomach; gave him some blue mass and calomel pills, that operated well, but on the 11th of October he came to the office and stated that his bitten hand felt as if the dog had just inflicted the wound, and that the skin of his arm felt sore the entire length, extending to the base of the brain, and in the night it seemed to settle in the humerus. 12 o'clock, still worse; pain in the hand, arm and base of the brain so great, applied a blister to the nape of the neck, that drew well in a few hours, but gave him no relief; his head seemed to fall in any direction it got a start; in the night of the 12th, he had a return of sick stomach, with pain in the bowels, and he became very restless and nervous; the pain in the hand and arm ceased, but he still suffered with the back of his head and spine; at four o'clock in the morning he asked for a drink of water, and when he attempted to drink it he said that he strangled and jerked so that he did not drink much of it; at daylight he became so nervous that Dr. McFarland gave him a dose of morphine, which quieted him.

8½ o'clock A.M., 13th, I visited him in consultation; found him quiet, pulse 120, head inclined to right, and considerable pain in back of head; gave me history of the feeling in hand and arm running up to back of head, and his inability to swallow water; I handed him a glass of water and he shuddered and caught his breath, but succeeded in swallowing a little at the third trial, with great effort; I then handed him a bowl of water that had set in the sun all morning, told him to put his hand into it, and it was attended with the same shuddering and spasm of the chest; then the right hand, with same result. We then informed him that he had an unmistakable attack of hydrophobia, and advised him to set his house in order, for death would be the inevitable result. He asked that we blister the site of the old wound, that was entirely healed long since, which we did, and gave him morphine under the skin, but in spite of that, by 12 o'clock his symptoms were of the worst kind—constant spasm of the chest and throat and perfect horror of water or anything of a fluid kind, but distressing thirst and dryness of throat, constant effort to clear his throat and spit; noise of any kind producing spasm, or a breath of air; mind perfectly clear; made his will and all his requests as to what disposition to be made of his body and effects; was a very intelligent man, and said, "after going through two wars, and crossing the

plains of California by overland, then to have to be killed by a trifling dog, looked hard;" frequently sat up in a chair and conversed. All the symptoms continued to grow worse until 1 o'clock on the 17th, when he expired.

The poison in this case seemed to remain dormant in the system four months and nine days; and from all the facts we can gather, the dog was not rabid, but only in an angered state, at the time of inflicting the wound, for he was seen drinking water for several days previous, as well as walking about without hydrophobic symptoms. I have given this case somewhat in detail because of its interest to the profession.

I will further add, that out of a number of dogs bitten, in a tussel with this one, not a single one, up to this date, has gone mad. We did not attempt any treatment in the case, except the exhibition of anodynes—morphine, hydrate chloral and monobromide camphor; it required very large doses of these to at all control the spasm of the chest.

J. R. Slaton, M. D.

Senatobia, Miss.

New Method of Plugging the Posterior Nares.

Ed. Med. and Surg. Reporter:—

Below I give you an extract of a paper read by me before the Highland County Medical Association, July 10th, 1878, on the subject of Purpura Hemorrhagica, setting forth a new plan, so far as I know, of passing the loop preparatory to tamponing the posterior nares.

"Probably the best device for the mode of operating to which I refer consists of a piece of round, fine-linked, gold chain, slightly flexible and smooth, about one-tenth of an inch in diameter and an inch or more long, attached by one end to a fine waxed silk cord, a foot or more long. If such a chain is not procurable a short strand of metallic cylindrical beads, or bird shot, compressed on a cord, or small strips of sheet lead wrapped on the cord, might answer the purpose, the essential qualities of a nasal gravitator being smallness, smoothness, heft and slight flexibility. After providing an instrument, which can generally be done at any farm house, the patient is then laid upon the back, the floor of the nose brought as nearly vertical as may be, and the loaded end of the gravitator lowered into the pharynx. Its arrival there will generally be announced by coughing, retching or clearing up of the throat. The patient then being brought to an erect position easily hawks up the weight and carries it forward on the tongue, when the operation of plugging may be proceeded with as usual."

The practicability of this procedure I have had occasion to demonstrate frequently, and find it much less annoying to the patient than Bellocq's sound or other unyielding instruments.

J. M. Spear, M.D.

Highland, O., Oct. 20th, 1879.

—The death of M. Devergie is reported in Paris, at the age of 82. He was a member and former President of the Académie de Médecine, Honorary Physician of the St. Louis Hospital, and former President of the Society of Legal Medicine. He was the author of a valuable work entitled *Médicine Légale, théorique et pratique.*

News and Miscellany.

American Public Health Association.

The seventh annual meeting of this Association convenes November 18th–21st, 1879, at Nashville, Tenn. The importance of the subjects to be considered has induced us to print the following papers connected with it:—

Circular of the Committee of Arrangements.

In great Britain and the British dependencies sanitary measures have, since the first cholera epidemic (1831), occupied the attention of its enlightened and far-seeing rulers. Now all Christendom looks with admiration upon the beneficial results of these measures. In America, however, government rests upon the people, and all great reforms based upon law must begin with them. To the people of the Union, more especially to those of the South and West, the fearful loss of life, property and comfort, caused by recent epidemics, is a plain warning that it is high time for them to act.

In view of the fact that the official and volunteer organizations representing sanitary science are to meet in this city November 18–21, it is earnestly hoped that every city and town in the South and West will be represented by at least one leading citizen as a delegate. Thus will the latest views upon Preventive State Medicine be diffused at once through all these threatened States, and an impetus to Health Reform given, which otherwise can hardly be attained by years of separate action.

Public men of all descriptions, jurists, clergymen, scientists, and others, are quite as welcome as physicians. For this reform is a matter of law more than of physic, and a healthy public opinion is the gist of the whole business.

From the North and East we have guarantees of the attendance of the ablest advocates of the cause in America, men who, by eloquent words and liberal acts, did unite a solid North in the relief of a suffering South. Let them be met by a hearty Southern welcome.

The railroads in Tennessee, as usual where the Public Health is concerned, have agreed to do all in their power. Passes will be sent to delegates from other States, both ways, over the main lines in Tennessee, upon early application to the undersigned. Doubtless the same courtesy will be extended to the delegates by the roads nearer home.

For persons in Tennessee the usual excursion rates can be obtained from the railroads centering in Nashville. The accompanying circulars will explain the character of the proceedings.

For special information address

J. Berrien Lindsley,
Secretary of Committee of Arrangements.

University of Virginia,
Charlottesville, Aug. 15th.

To Members of the American Public Health Association:—

Gentlemen:—At a meeting of the Executive Committee, held in Washington, January 3d, it was decided that the principal subject for discussion at the next annual meeting of the Association, to be held in Nashville, Tennessee, Novem-

ber 18th–21st, shall be the sanitary condition of towns and cities, especially those of the Southern States.

In selecting a subject of so wide a scope, the Committee considers that it will be expedient, if not indeed indispensable to the attainment of useful results, to limit the inquiry to certain specified branches of the general subject, rather than to attempt to cover the entire ground of city sanitation.

A few years ago a committee, appointed by the Association, prepared a series of elaborate schedules of questions facilitating such an inquiry, which have recently been published in pamphlet form as Circular No. 2, of the National Board of Health. A copy of this pamphlet will be furnished to any member of the Association who desires to take a part in the proposed discussion, on application to Dr. T. J. Turner, Secretary of the National Board of Health, and a member of the Executive Committee of this Association. His address is, Office of the National Board of Health, Washington, D. C.

The Executive Committee recommends the following subjects of inquiry: Water Supply, Schedule C; Drainage and Sewerage, D; Disposal of Garbage and Excreta, H; Slaughter Houses and Abattoirs, K; Public School Buildings, M; Public Health Laws, Regulations, etc., R; Expenses of Municipal Sanitation, U.

Attention is also called to the following resolution, presented by Dr. A. L. Gihon, U.S.N., at the last annual meeting:—

Resolved, That the Executive Committee be directed to provide for the investigation and discussion, at the next annual meeting, of the most effective means for preventing the spread of venereal diseases.

Members who propose to consider these subjects, or who may desire to treat exhaustively some special subject of their own selection, are invited to prepare papers not to require more than thirty minutes in reading, and to forward titles and abstracts, in accordance with Section VIII of the Constitution. J. L. Cabell,

President American Public Health Association and Chairman Executive Committee.

ANNOUNCEMENT.

The Executive Committee of the American Public Health Association has decided to supplement the discussion on certain points relating to city sanitation heretofore ordered for the Nashville meeting, and announced in the President's circular of August 15th, by one on the practical questions connected with the management of an actual or threatened outbreak of yellow fever. It is considered proper that the whole country should have the benefit of the practical lessons taught by the epidemic visitations of 1878 and 1879, and it is fit that the popular diffusion of this knowledge should be made through the medium of this Association, which will have an unusually favorable opportunity, at the meeting in Nashville, November 18–21, for collecting and recording the conclusions of intelligent and skilled observers as to the practical working of the measures recently put into operation by State and municipal authorities, aided by the National Board of Health, with a view to prevent the spread of the disease from local sources of infection.

The oral discussion will be prefaced by the reading of several papers by members of the Association who have been actively engaged in this practical work during the prevalence of the existing epidemic in Memphis and elsewhere. In order to give definite direction to the discussion the Executive Committee has adopted the following schedule of the points to be especially considered:—

1. How to deal with a city in the yellow fever zone, in order to prevent the appearance of a first case.

2. How to prevent the importation of a first case.

3. How to deal with a first case, and early cases generally, when, in spite of precautions under first and second headings, it has made its appearance.

4. The duty of local boards of health, or other health authorities, to report such cases promptly, even though there may be some doubt as to the diagnosis. Whether the knowledge that such reports would be faithfully made would not have a tendency to allay apprehensions and give confidence to other communities, while warning them of the importance of making preparations for contingencies.

5. Under what circumstances may it become necessary or expedient to remove the unacclimated portion of the population from an infected place? How may this be effected for the poorer classes of the population, and how should the people thus removed be cared for and supported?

6. Measures for isolating a dangerously infected place.

7. Organizations for the relief and treatment of the sick in an infected city.

8. Measures for preventing the spread of the disease from an infected place by railroads, including the management of transfer stations.

9. Inspection of steamboats at an infected place and at intermediate stations between the port of departure and their final destination. Should stations of observation be established by the National Board of Health? If so, what should be their relations to the health authorities of the States within whose territorial limits they may be established.

10. Results of the coöperation and aid given by the National Board of Health to State and municipal boards, under the provisions of the act approved June 2, 1879. What suggestions may be made to render this system more efficient?

J. L. Cabell,

President American Public Health Association.

October 4, 1879.

Washington Training School for Nurses.

The second session of this excellent institution opened October 27th. On the occasion Dr. Toner, ex-President of the American Medical Association, made an address, in the course of which he aptly stated the object of the institution, in these words—

It is not mere servants that are wanted in the sick room, or that we propose to instruct in this school, and to recommend as competent and trustworthy nurses. By a wise selection of

pupils and by careful training we aim to assist in elevating and dignifying the calling of the nurse to that of a respectable and profitable profession.

The necessity for and the usefulness of the office is now generally admitted by the public. That it will require persons of some culture and sound judgment, with capacity for self-denial, and observation to acquire the necessary knowledge to qualify them for such responsible duties, and an individual perseverance to make such knowledge available, must be conceded. Indeed, the self-abnegation and control of feelings required of the nurse—as to wear constantly a bright countenance, to command a prompt and never wearying sympathy, with a kindly word of encouragement in a gentle tone of voice, and to be cheerful without levity, and silent without moroseness; to be ever attentive and observant of instructions and the patient's condition—requires qualities scarcely less heroic and perfect than are demanded in the professional and higher walks of life. Where such qualities and skill exist in the nurse they will be rewarded. Those who do not possess these characteristics in a fair degree had better seek some other avocation in life.

Progress in Treatment of the Insane.

The word "Bedlam" has become, in English, a common synonym of turmoil, noise, and mismanagement. But how different the London hospital of that name, now, from what it was early in the last century, when it was a common pastime of the town to visit it, in order to see the maniacs flogged. Dr. J. P. Gray, of the Utica Asylum, in an address before the Oneida County Medical Society, described it and some others he had seen in a recent visit. In regard to decorations, better furnishing, etc., in the institutions in Great Britain, there seemed to be a general progress in this direction. He saw that in some of the oldest institutions, for instance, Bethlem Hospital, of London, this, however, being but one of many, painting, in pleasant, bright, and cheerful colors, decorative paper, etc., has taken the place of the dreary, white-washed wall and ceiling. The glass transoms could be seen over the doors, in place of the holes of former times, to the infinite comfort and pleasure of all, and as he was informed and could well believe, to the great benefit of the patients. In some of the institutions he says he saw the interiors in the process of transition, some of the wards being not yet complete, and the contrast was very striking. In some of the institutions the chapels were really very elaborately finished, to correspond with the general sentiment in these matters outside.

Ancient Cosmetics.

The *Edinburgh Review* says: Most interesting is the reflection how persistent is that human weakness which for more than 6000 years has rewarded the skill of the professors of cosmetic art. We know from the tract, Sabbath of the *Mishna*, that the oil of roses, and the use of acid remedies for the toothache, are as old as the codification of the oral law. Nay, more, the use in those early days of artificial teeth is proved by the debate on the question whether it was allowable to go out on the Sabbath with these contrivances in the mouth. The decision, a very characteristic one, was that if the tooth was regarded as an ornament it was legal so to do, but not if it was regarded as a useful implement. It was also allowed to bear about the person on the Sabbath a fox's tooth, which, if extracted from the living animal, was good to procure sleep.

The Talmud on Medical Matters.

Mr. Magnus, Sr., of Berlin, publishes, in the *Deutsch. Archiv f. d. Geschichte d. Medicin* (1879, p. 260), the following passages from the Talmud:—"At the head of all diseases am I, the blood; at the head of all remedies am I, the wine. Eat hearty, you will feel its effects when walking. A drop of cold water mornings (in the eye), and washing the hands and feet in the evening, are better than all eye salves. Before a distant physician may arrive the eye may become blind. Badly off is the town whose physician has the gout, and whose oculist only has one eye. Honor the physician before you need his services. A physician who makes gratuitous cures is of no account. The door which is closed to prayers for alms opens for the physician."

MARRIAGES.

ALEXANDER—THAYER.—October 15th, at Washington Heights, N. Y., by the Rev. Dr. J. C. Eccleston, Welcome T. Alexander, M.D., and Aimee Gabrielle, only daughter of F. A. Thayer.

HALL—COOLIDGE.—In Boston, October 14th, at Trinity Church, by the Rev. Phillips Brooks, assisted by the Rev. John Hall, D.D., of New York, Dr. Richard J. Hall, of New York, and Miss Elise B. Coolidge, of Boston.

JACKSON—REED.—At Camden, N. J., October 1st, by Rev. L. C. Baker, John W. Jackson, M.D., of Rockaway, N. J., and Mrs. Sarah C. Reed, of Camden.

LLOYD—NEWELL.—At Haddonfield, N. J., on the 15th ult., by the Rev. L. M. Colfelt, Dr. James Hendric Lloyd, of West Philadelphia, and Sue D., daughter of the late William C. Newell, of Philadelphia.

SEIBERT—WELSH.—On October 3d, 1879, in West Philadelphia, at the residence of Mr. John Welsh, the father of the bride, by the Rev. R. Bethell Claxton, D.D., John Philip Seibert, M.D., of Chambersburg, Pa., and Marion Welsh, of West Philadelphia.

TAYLOR—COOPER—On Thursday, October 23d, at Christ Church, Philadelphia, by Rev. Dr. E. A. Foggo, assisted by Rev. Dr. J. F. Garrison, H. Genet Taylor, M.D., and Helen, daughter of Alexander Cooper, all of Camden, N. J.

DEATHS.

BEAUMONT.—Dr. A. H. Beaumont, a well-known citizen, and a classmate of President Hayes at Kenyon College, died at his residence in Cleveland, Oct. 30th, at the age of 56 years.

DUFFIELD.—At McConnellsburg, Pa., October 13th, Annie E., eldest daughter of Dr. S. E. Duffield, in the thirtieth year of her age.

HOLDEN.—On Sunday, the 19th inst., at Scarborough, Westchester County, N. Y., Dr. Jas. H. Holden, in the 52d year of his age.

RYAN.—On Sunday evening, the 19th inst., Dr. Charles Ryan.

WADSWORTH.—In this city, on the 31st ult., Kate S. Wadsworth, wife of Henry Wadsworth, M.D.

HORSFORD'S
Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges.

MANUFACTURED BY THE

RUMFORD CHEMICAL WORKS,

1155-1206 PROVIDENCE, R. I.

DE DUDLEY'S EMULSION DE
OF PURE
NORWEGIAN COD LIVER OIL
PANCREATINE
AND
DE LACTO-PHOSPHATE OF LIME DE

FORMULA.—Each fl. oz. contains six grs. of Pancreatine, sixteen grs. of Lacto-Phosphate of Lime, twenty-five per cent. of Glycerine, and **fifty** per cent. of Norwegian Cod-liver Oil.

THE ONLY PANCREATIC EMULSION MADE IN THE UNITED STATES.

This preparation is respectfully submitted to physicians as being **always** reliable. Although well aware that Cod-liver Oil Emulsions have fallen into deserved disrepute, yet we are confident this will stand any test or trial it may be subjected to. It contains no GUM ARABIC, TRAGACANTH, ALBUMEN, SACCHARINE OR ALKALINE MATTER; therefore, it will not SAPONIFY, FERMENT nor RANCIDIFY. The addition of **Pancreatine** insures rapid and complete assimilation, enabling patients with very weak stomachs to easily retain and digest it.

Guaranteed to keep in any climate. Physicians supplied with samples (express paid) on application.

DUDLEY & CO., Pharmaceutical Chemists,

Laboratory, 397 and 399 Pearl Street. 423 Fulton Street, Brooklyn, N. Y.

MESSRS. DUDLEY & CO.: *Dear Sirs*—Though your EMULSION has not been before the profession a long time still I have used it quite extensively in my practice, and can truly say I think it one of the most elegant preparations of Cod-liver Oil I have ever prescribed. I find it can be readily taken and borne by the most delicate stomach, and the PANCREATINE and PHOSPHATES make its administration desirable in a large number of cases other than phthisical. In fact, there are few cases of mal-assimilation and general debility in which its administration will not do good; and it gives me pleasure to recommend it to my professional brethren.

1179- HOMER L. BARTLETT, M.D., Brooklyn, N. Y., Consulting Surgeon Kings County Hospital.

NEW REMEDIES.

FLUID EXTRACTS.

Coto Bark.—From BOLIVIA. Almost a specific in acute and chronic diarrhœa, cholera, cholera morbus, etc.

Cascara Sagrada.—(**Rhamnus Purshiana.**) From the PACIFIC SLOPE. A certain remedy for habitual constipation; and very useful in all cases where a laxative or cathartic is indicated. Beware of the fluid extracts of spurious varieties of this bark.

Folia Carobæ.—From BRAZIL. A powerful alterative, which exerts a marked curative action in syphilis, scrofula and kindred disorders.

Rhus Aromatica.—A remedy in diabetes, and other diseases of the genito-urinary organs.

Damiana.—(**Turnera Aphrodisiaca.**) From MEXICO. The best known aphrodisiac. Of great value in impotence, spermatorrhœa, and loss of sexual appetite.

Boldo.—(**Peumus Boldo.**) From CHILI. The new tonic. Very useful in dyspepsia, hepatic torpor, yellow fever, etc.

Berberis Aquifolium.—From CALIFORNIA. Has marked alterative and tonic powers, and has been used with extraordinary success in salt rheum, psoriasis, eczema, scrofula and syphilis.

Black Haw.—(**Viburnum Prunifolium.**) From the UNITED STATES. Employed to prevent abortion and miscarriage.

Grindelia Robusta.—From CALIFORNIA. A valuable curative agent in asthma and diseases of the air passages.

Grindelia Squarrosa.—From CALIFORNIA. Anti-malarial. Used in enlarged spleen and other malarial diseases.

Cereus Bonplandii.—(**Cereus Grandiflorus and Cereus McDonaldii.**) From MEXICO. Heart sedatives. Very useful in controlling functional and organic disturbances of the heart.

Kaki.—(**Diospyros Kaki.**) From JAPAN. Peculiar action on the mucous surfaces. Useful in mucous dyspepsia, typhoid fever, etc.

Cercis Canadensis.—Indigenous. A positive remedy in chronic diarrhœa, dysentery, etc.

Jaborandi (diaphoretic). **Guarana** (sick headache). **Fucus Vesiculosus** (anti-fat).
Bearsfoot (enlarged spleen). **Coca** (nervous stimulant). **Kava Kava** (Gonorrhœa).
Eucalyptus Globulus (antiseptic and anti-malarial). **Yerba Santa** (coughs).
Yerba Reuma (catarrh). **Wood Betony** (dyspepsia). **Ustilago Maidis** (oxytocic).
Penthorum Sedoides (catarrh). **Soap Tree Bark** (tooth wash).

CRUDE DRUGS.

Goa Powder (ringworm and diseases of the skin). **Gurjun Balsam** (a substitute for Copaiba).
Alstonia Constricta (a substitute for Calisaya).

SUGAR-COATED GRANULES.

Calcium Sulphide 1-10 gr. (for the cure of boils and carbuncles).

Our limited space prevents our describing in detail the history and application of each remedy, but to those interested in NEW REMEDIES, we will say, that we can furnish interesting information relative to the above new drugs.

PARKE, DAVIS & CO.,

DETROIT, - MICHIGAN.

Our New Remedies can be procured of the Drug Trade throughout the United States. By specifying **"P., D. & Co.'s"** in all cases, you will ensure reliable preparations of the **true drugs.**

A NEW FORM OF MEDICATION,

COMBINING

Reliability and Accuracy for the Physician,
Convenience and Elegance for the Pharmacist.

Saccharated Extracts.

THE DRY, SOLUBLE, EXTRACTIVE MATTER OF THE DRUG IS TRITURATED WITH MILK SUGAR IN SUCH PROPORTION THAT ONE TROY OUNCE OF THESE EXTRACTS REPRESENTS ONE TROY OUNCE OF THE DRUG.

A Soluble Drug of Uniform Strength and Quality.

The **percentage of Dry Extract** is in all cases **indicated** on the label.

In the more **powerful remedies** the **percentage** of **alkaloid** is also indicated.

The advantages of the **Saccharated Extracts** over ordinary extracts are:—

1. They are stable at all temperatures and under all conditions; they will not swell, ferment, or waste.
2. They are always of a uniform and convenient consistency, not becoming solid, as is the case with ordinary powdered extracts.
3. Their division is rapidly effected, and with great convenience.
4. Their invariability in strength renders them capable of being prescribed with precision.
5. Their general application to any form of medication, as Capsules, Compressed Pills, Troches, etc.

LAWTON'S
ABSORBENT COTTON

FOR

HOSPITALS, DISPENSARIES, PHYSICIANS, DENTISTS, DRUGGISTS, PHOTOGRAPHERS, ETC., ETC.

The article furnished by us will be found superior to any other, on account of the facilities we possess for the manufacture, and the care taken at every step of the process.

Not only in general surgery, but especially in gynæcological practice, Absorbent Cotton has found great favor. It differs little from ordinary cotton in appearance, except in its uniformly fine quality and pure white color, freedom from all impurities — being entirely cleansed from oil, resin and all foreign matter.

The property of instantly absorbing liquids, its exquisite softness and great cheapness render it an invaluable substitute for Patent Lint, Charpie or Sponge.

We put up our Absorbent Cotton in neat and convenient packages, containing one pound, one-quarter pound, and two ounces.

A descriptive Circular will be forwarded on application. Samples containing two ounces will be sent, free of postage, on receipt of twenty cents.

PEPTONIC PILLS.

Pepsin, Pancreatin with Lacto-Phosphate of Lime and Lactic Acid.

(COPYRIGHT SECURED.)

This pill will give immediate relief in many forms of Dyspepsia and Indigestion, and will prove of permanent benefit in all cases of enfeebled digestion, produced from want of proper secretion of the Gastric Juice. By supplementing the action of the stomach, and rendering the food capable of assimilation, they enable the organ to recover its healthy tone, and thus permanent relief is afforded. One great advantage of the mode of preparation of these pills is the absence of sugar, which is present in all the ordinary Pepsin and Pancreatic compounds. In this form, the dose is much smaller, more pleasant to take, and is less apt to offend the already weak and irritable stomach. The results of their use have been so absolutely satisfactory, that we are confident further trial will secure for them the cordial approval of the Medical Profession and the favor of the general public.

Each pill contains one grain of pure PANCREATIN, which is equivalent to 10 grains of the ordinary or Saccharated usually prescribed and dispensed. Physicians will appreciate the great advantage of this mode of administration, the increased benefit to the dyspeptic being due to a full and effective dose of each, freed from unnecessary bulk, and really hurtful addition of sugar. A single pill will give immediate relief.

DIRECTIONS:—Take one pill immediately after eating or when suffering from Indigestion, Lump in the Throat or Flatulence. For children, reduce the pill to powder and give one-fourth or half, according to age.

THE THEORIES OF SEX PRODUCTION.

BY A. VON MANSFELDE, M.D.,
Of Ashland, Nebraska.

[Extract from a paper read before the Nebraska State Medical Society. Published by permission of the Society].

The theories of sex production begin with the Hippocratic Theory, which consisted in the belief that the right testicle furnished the seed for males and the left that for females. This theory, yet a common notion with many, even medical minds, received its refutation by Regner de Graaf. His experiments consisted in the extirpation of one or the other of the testicles, or the ligation of one or the other ovary, or rather ovarian ducts, of rabbits, and invariably would the offspring consist of both sexes. Dr. Thomas P. Tuckey, of Castletownroche, writing about the position of the placenta in male and female births (it being situated on the right side of the fundus in the male and on the left side in the females), says: It seems such an easy solution of the matter, that the right ovary should be intended for the production of male and the left for that of the female children, it leads me to such a train of speculations on the proposition that a woman has only sons because of atrophy or other diseases of the left ovary, or *vice versa*, two hundred and fifty years after the conclusive proof of Regner de Graaf to the contrary. (*Half-yearly Comp. of Med. Science.* Part 22, page 151.)

In regard to the notions indicated by Joubert's question, of the influence of the moon; or the notion of the position of the female during copulation, I say nothing, since they do not deserve refutation at this day.

It was my intention to note at length the many speculations in this direction, but the fruitlessness of the effort causes me to abstain. I will, therefore, only enumerate the more prominent theories. First, the so-called Hofacker-Sadler law of sex production. It consists in this declaration, that in marriages in which the husband is the senior by six years and upward male offspring decidedly preponderate. Statistics, of which there are very many and easily accessible, certainly sustain this assertion; yet it cannot be the law of sex production, since very striking exceptions oppose its universality.

Next in importance is the theory of M. Thury, Professor at Geneva, who taught thus: "The sex depends upon the degree of maturity of the egg at the moment of fecundation; that which has not reached a certain degree of maturity producing the female, and if fecundated when this point of maturity has passed, a male. It is certainly true, that observance of time in regard to the act of fecundation plays a prominent role in sex production, and numberless instances on record sustain it. (See Medical and Surgical Reporter, January to June, 1868.) Yet the precise period at which the ovum escapes from the ovary, especially in human females, is very uncertain; the conditions that determine the time of contact of the spermatozoa and the ovum are therefore exceedingly variable, and of course, for practical purposes, grant this being the law, would be valueless. I shall show, however, that M. Thury mistook one of the mechanical factors for the law itself, and this factor being one of the main causes of sex production, we have an explana-

tion furnished why his theory should have met with so many concurring instances.

But human ingenuity is untiring, as witness the next theory, which I quote from the Boston *Medical and Surgical Journal*, for September 26, 1878. It is the antipode to the theory of M. Thury. Dr. J. B. Swift, the writer, says: While studying the reproductive organs in the microscopical laboratory of Dr. Carl Heitzmann, of New York, last winter, Dr. Heitzmann advanced the following theory in regard to the determination of the sexes (let me say that this is the same theory modestly advanced by the learned author of Flint's *Physiology*, in vol. v, on *Generation*, page 346, and I will leave it to future inquiries, who of these two gentlemen take precedence. I am thankful to both, for they furnish me in this article good proof for my position, though otherwise intended). We know that it requires only a few spermatozoa, perhaps a single spermatozoon (see MEDICAL AND SURGICAL REPORTER, April 19th, 1879, page 349), to impregnate an ovum. If an ovum becomes impregnated by a few spermatozoa, the female element will be in excess and the result will be a female. If, on the other hand, a good many spermatozoa impregnate the ovum, the male element will preponderate, and a male will result. Now, if an ovum is high up, that is in the ovary or at the fimbriated extremity of the fallopian tube, probably only a few spermatozoa will come in contact with it. But if the ovum is low down, then many spermatozoa come in contact with it. If menstruation and ovulation are dependent one on the other, as many authorities affirm, then the situation of the ovum may be determined by the menstrual period; during the interval between the periods the ovum is in the ovary; just before the flow begins the ovum may be on the surface of the ovary or in the fimbriated extremity of the fallopian tube. As menstruation goes on the ovum descends, and the flow may entirely cease before the ovum is discharged. Then it is low down in the fallopian tube or even in the uterus itself. Now, if coition takes place during the interval between two periods, or just before menstruation begins, the ovum being up high, only a few spermatozoa pass up the fallopian tube and reach it; but if coition is just after menstruation, then the ovum is within the reach of many spermatozoa. Stock breeders understand this. If they want a female, they put the two sexes together at the beginning of the rutting period, but if they want a male, they wait until the female has been in heat some time.

Both Doctors Heitzmann and Flint, and Prof. Thury, recognize the time of the union of the factors concerned in propagation as being a cause of sex production; but while the former recognizes the influence of time upon the spermatozoa only, the latter allows himself to be governed alone by the influence of time upon the non-fecundated eggs. Dr. Swift then continues, at length, to furnish twenty cases to sustain this theory; they consist of two kinds: first, those cases in which connection had taken place shortly after menstruation, and which were followed by male offspring; and secondly, cases in which connection occurred midway, or nearly so, between the recurrence of menstruation, with the result of female offspring. The Doctor mentions about ten cases of the former, and I will strengthen his position by a few thousand more. I draw your attention again, gentlemen, to the Jewish law, which does not permit the male to make use of his prerogatives until the expiration of a certain time after menstruation; and this fact alone effects the percentage of the births of sexes thusly: while the common average of all births of all nations is as 104.5 males to 100 females, among the Jews of Prussia and other eastern nations it is 114–120 males to 100 females, and this average would be still greater, did fecundation invariably result from the first connection. We will presently explain this apparent incongruity. In the first place, the Doctor's theory contains an "If," backed, as he says, by many authorities, and yet incorrect when subjected to such writings as those of A. Reeves Jackson; for it must be admitted as a fact, undeniable, that ovulation in the human female may take place, and does so, first, when the female does not menstruate at all, as prior to the establishment of the menses, during pregnancy and the period of lactation; and, secondly, at any time during the intermenstrual period; coition and its accompanying genetic excitement and organic congestion being the prime motor power. In the second place does this theory run counter to all our experience in comparative embryology. Take for an example the bee; Dzierson observes that the unimpregnated eggs of the bees produce drones (males), and that the workers (imperfect females), although incapable of impregnation, sometimes lay eggs that produce drones. Eggs producing females are, however, laid by the queen, and these only *after impregnation*. That the male element of fertilization in the case of the bees would seem, therefore, to be essential to the production of females only. "Miles, 332."

The next theory which deserves attention is that of Mr. Gentry, a corroboration of Mrs.

Mary Treat's observations, and supplemented by the work of Mr. Thomas Meehan on plants; it is this: The higher grades of nutrition or vitality produce the female, and the lower grades the male sex. It may be stated, in regard to this last theory, that as a factor in sex production it must have quite a prominent position, but is not the law of sex production; only one of the means of sex differentiation? Finally, I ask you, gentlemen, to indulge me for a few moments if I intrude with my own thoughts upon the subject. I justify my demands upon your time and patience by the fact that I have consumed years of study in this particular direction, thus preventing the possibility of springing illy matured fancies upon you, and that I believe myself capable of presenting the subject in such a shape that it will prove more satisfactory than the theories just enumerated.

My Own Theory.—Sex is the result of the quantity of spermatic fluid taken up by the ovum during the act of fecundation, the minimum amount necessary to accomplish fecundation always producing males, and the maximum amount always producing females. The variation between the maximal and minimal points producing offspring of one sex or the other, in the ratio in which the male element is appropriated, or one or the other of the following conditions supervenes:—

1. The time when the two elements meet; males preponderating as the time from the rupture of the graafian follicle to the accomplishment of fecundation is lengthened.

2. The vigor of the ovum; which vigor is dependent upon (*a*) the time expired since the detachment of the egg from the discus proligerous of the graafian follicle, and (*b*) the health, *per se*, of the female in whose economy the egg is matured. Females being in excess in the ratio of the greatest vigor of the ovum.

3. The vigor of the spermatozoa. This again depends upon (*a*) the time elapsed since their change of domicile, and (*b*) upon the health, *per se*, of the male who furnished them. The greater the vigor of the spermatozoa the greater the probability of female offspring.

The facts in the case then seem to be, that the sooner the elements meet and the greater the vigor (the nutrition of the female being above par), the greater the probability of female offspring; and *vice versa*, the later the union of the generative factors takes place, and the weaker the elements concerned in the fecundation (the nutrition of the female being below par), the greater the probability of male offspring.

I have placed the factor of time in the foreground, since it has, in the theory of Professors Thury and Flint, demanded most attention; as already stated, time has a decided influence in sex production. While Prof. Thury allows the influence of time to act upon the perfection of the egg, this again determining the sex, Prof. Flint and Dr. Heitzmann, by the same influence, time, afford the spermatozoa an earlier or later access to the egg. In company with these gentlemen, I make use of the same factor, but from an opposite principle. In the first place, the egg, just after breaking its ovarian envelop, is at the acme of its vigor, and the time passing from this moment counts its course of decline, which is only ended by death or intervening fecundation; this, you will admit, is a sound deduction from scientific embryology, and does not give the least sustenance to the theory of Prof. Thury. The second position, that of Prof. Flint or Dr. Heitzmann, presupposes, as a scientific fact, that the spermatozoa alone have the capacity to enter the ovum, and that their accumulated presence produces the male offspring. To this latter assertion, as already stated, the fact opposes itself, that in the lower forms of animal life males may be developed from the unfecundated egg, while female offspring invariably demand the presence of the male factor; the former proposition, in regard to the "ego sum" of the spermatozoa, falls prostrate, when we remember the passive condition in the fecundation act of many animals, thus opening the door, by necessity, to other causes, and these we eagerly admit, in the shape of the self dependent ovum. The egg will take up any quantity of spermatic fluid, limited only by the size and vigor of the partaker; now, whatever tends to favor the latter conditions will, of course, increase the quantity of the spermatic fluid taken up. This self-evident physiological proposition, we hope, does not need any proof, but on the other hand, the question becomes legitimate, what influence, if any, has the male factor upon sex production under these conditions? The answer may be found in the description of the first changes of the fecundated egg, as given by Waldeger and others, to the effect that three to four days after fecundation (in the fowl), upon the sexual part of the Wolfian bodies a medium eminence is noticed, covered by epithelial cells, which eminence goes on developing until the eighth or ninth day, when, in the embryo destined to be a male a retrogression takes place, and in the embryo developing into a female progression continues, until finally the ovaries, with their eggs, denote the sex of the offspring. This epithelial deposit, surrounded on all

sides by flattened cells, indicative of the future peritoneum, is not evolved from the tissues of the embryo, but is a part of the original chaos of segmented cells forming the germinal membranes. This being an established fact, you demand an explanation of the changes which this deposit undergoes in the first days of its existence, in one instance progressive, in another retrogressive. It is only necessary to draw your attention to a physiological axiom, which teaches that stimulation, assisted by nutritive conditions of a progressive capacity, will always be followed by growth, be this of a normal or abnormal character. Stimulation, in this instance, is furnished by the quantity of the embryonic deposit upon the Wolfian bodies, which deposit consists of segment cells of the original fecundated egg, left over, so to speak, in the shape of yeast, to quicken the leaven of a future generation; the growing embryo having appropriated the necessary quantity of this material for the formation of its asexual body. Now conceive this ovarian deposit, this yeast, to be abundantly present, and admit the superior vitality of the forming embryo, a necessary precedent to the presence of the deposit, and you will have the sequence, increased nutritive process, always, as already stated, followed by greater growth. Do facts sustain this position? The first children of a marriage consist of a greater number of females, in the proportion of 100 females to 53 males (Burdach). The proportion of females in illegitimate births is greater than in legitimate. Causes tending to increase the birth-rate tend also to increase the proportion of female offspring (Dr. H. B. Baker, of Michigan). If the larvæ of butterflies are abundantly supplied with food before going into the chrysalis state, the perfect insects are females. Mrs. Mary Treat (*Popular Science Monthly*, June, 1873).

Sex in plants is the result of the grade of nutrition, the highest grades producing the female sex (Mr. Thomas Méehan). The queen bee is invariably developed by the assistance of a superior quality and quantity of food. Thus, irresistible facts seem to prove the necessity of the most perfect combination of circumstances, all in the direction of superior qualities, for the production of female offspring, and since these conditions cannot be said to exist in the majority of cases, the legitimate conclusion is drawn that male births preponderate, and secondly, that males have not the vitality which the females enjoy by reason of their superior developmental advantages. Is this true? Of the total number of still births there are three males to every two females. Death takes place in the ratio of four males to three females in the first two months, and in the next three months as five males to four females (Carpenter's *Physiology*).

It is well for physicians to consider the sex of their patient in making their prognosis, since my experience permits me to make it more favorable for females than for male children, under like circumstances. In regard to the preponderance of male births, I need only draw your attention to the registration of births and to the statistics given by Ch. Darwin in regard to the domestic and other animals; both will abundantly prove the facts in the case; and finding a very fair equality in the numbers of both sexes at maturity, we have furnished another proof of the lesser vitality of the male.

There is still one task for me to perform, namely, to furnish an explanation of the conflicting statements, all given in sustenance of the most varying theories, and all of them bearing the impress of truth. The great objection to all of them is this, that instead of applying the test to the law itself, the experimenters invariably confounded the factors concerned in the process of sex production with the law, and drew their conclusions from these faulty premises. Their conclusions were always of the *post hoc ergo propter hoc* species. Prof. Thury finds that in crossing the sexes at the commencement of heat, more female births are the results, and he quickly concludes that this is caused by the influence of his law of sex production. "The less mature the egg when fecundation ensues, the more certain a female offspring." But I interpose the physiological fact that the egg is more vigorous the moment it is liberated from the graafian follicle. Dr. Flint argues that the later the male factor enters the female economy the sooner will it come in contact with the approaching egg, and the offspring will be a male, by reason of a numerically greater number of spermatozoa entering the egg, in consequence of their accumulated presence. I suggest here, for consideration, the facts that spermatozoa abound most plentifully in very small quantities of seminal fluids for this reason, together with the fact that the quantity of spermatozoa being the same, to all intents and purposes, the difference of their presence in the ovum, numerically considered, must be sought for in the condition of the ovum, which, in the light of our present knowledge, must be admitted to have its share in the fecundating process. In addition to this I must again call your attention (even at the risk of repeating) to the fact of the necessary presence of the male factor for the

evolution of female offspring in the propagation of the bee family. Does science record anything to justify the supposition of a reversion of this law of sex production in favor of the mammal? The cases of Dr. J. B. Swift most plainly prove that when the ovum, in its fullness of life, conjugates with the spermatic fluid, its product is generally a female; all his cases occurring at an intercatamenial period, because impregnated by the spermatic fluid coming in contact with the ovum, liberated during or after coition—most likely discharged in consequence of the stimulus furnished by the sexual excitement. In corroboration of this I will state that of all the cases of extra-uterine pregnancies which I had the facility of examining, the fœtus was invariably of the female sex. I stated above that the greater number of male births among Jewish women would be swelled, if conception did not often take place, just as happened in the cases of Dr. Swift, from the succeeding ovulation, and not the preceding one, which would have furnished the male instead of the female progeny. All the cases on record then, for whatever purpose they may have been originally intended, furnish proof of the influence of time in the union of the factors of fecundation (not in the union of the sexes, however), for the purpose of sexual differentiation. Everything favoring an early conjugation of the sexual elements still at the zenith of their bodily vigor favors the development of the female, by reason of the surplus amount of free cells, constituents of the primordial eggs. Thus the female becomes the depository of the germs of a future generation of men and women who will be capable to appreciate the great influence a perfect and noble mother has upon the destinies of her offspring; those will be the men and women who will find their greatest glory in shaping into perfect harmony the greatest of all creations, the woman, who, in the delicate ovum, carries the inheritance to us of a mighty past and also the possibilities of a grander future.

THE HYPODERMIC USE OF MORPHIA.

BY D. M. BARR, M.D.

Read before the Northern Medical Society of Phila.

The hypodermic use of morphia was first introduced to public notice by Mr. Hunter, of England, in the year 1859, as a remedy for delirium tremens. The use of the instrument rapidly became general, until, at present, a practitioner is certainly not fully armed without it.

It may, therefore, seem like presumption in any one, at this late day, to read a paper before a medical society upon a subject so common to the profession. I would not have introduced the subject to-night, but for the fact that I have lately suffered, as all may suffer, through a widespread ignorance on the part of the general public, as well as some druggists, regarding the nature and results of this remedy. Many druggists are free to express opinions upon the medical care of their patrons; therefore it is the duty of the profession to give them correct notions, especially of new methods and remedies.

In 1865 a certain druggist put up for me a two-grain quinine suppository for a babe one year old. The druggist thought it was too much, and told the family that the doctor must have made a mistake. The babe had diphtheria, and upon this day was unable to swallow; the next day it died. The family would have no more babes *poisoned* by me, and changed their doctor. I remonstrated with the druggist, when he told me he "knew how to conduct his business." This same druggist prepared medicines for a patient of mine, during August and September of this year, contrary to my wish, but not interdiction, as they were old patients of mine, and I supposed could not be influenced.

The condition was an inflammation of the ovaries with parametritis. The ovaries could be plainly felt, right and left, and the pelvic tissues were hard as a board. Between the pains of inflammation and neuralgia, involving the lumbo-abdominal and sciatic nerves, I never saw greater suffering. There was frequent vomiting, so that no relief could be afforded by the mouth. I used hypodermics of morphia, half-grain doses, night and morning, with happy effect, arresting vomiting, restoring appetite, and temporarily controlling pain.

But with the increase of local congestion pressure upon the nerves increased, and a dose of three-quarters of a grain at bedtime was required on several occasions; even these failed to protect the patient perfectly from one dose to the next.

She lay, half asleep, half awake, tortured with returning pain; half understood conversation, seemed as in the walking stage of typhoid, with a disposition to get out of bed and a wandering imagination, so common in all delirium associated with uterine trouble. There was also occasional vomiting as the effects of the medicine wore off. Yet with all this there was a cool skin, normal temperature, regular pulse (at 80), and generally favorable condition.

The husband and friends became very anxious, uneasy and discontented. "Nobody had ever

heard of so many injections." The mother-in-law was sure I was killing her with these injections. The husband wanted to know, again and again, whether these injections would not leave her an imbecile; would they not weaken the system? were they curative? and other anxious queries; "everybody thought the dose too large; nobody ever knew of such use."

In vain I assured him this pain could not last long; that suppuration or resolution must soon take place, removing the cause of the neuralgia, and thus arresting the pain. In vain I pointed out the next period for menstruation as the probable outside limit of the severe pain, which had been set up just previous to her last period. (The show had been arrested by cold from exposure, originating the trouble.) In vain I assured him of the certain safety of his wife, both mental and physical.

Had I given her three hypodermics daily, as I often do, these troubles might have been quieted without vomiting, but unfortunately I ordered a chloral mixture, from which I find great comfort in these cases. Each dose consists of morphia sulph., gr.$\frac{1}{8}$; chloral hydrate, grs.xv; potass. bromide, grs.xx. To be repeated as required. The husband came home from the drug store assured that his wife would be injured by the medicines.

I cannot say whether or no by the advice of the druggist (but this I know, the druggist should have been able to assure him that it was a common dose of medicine), but under the impression that nobody used such doses, he wrote me: "Dear Doctor—My wife is too ill to have an opinion of her own, and it is my opinion that to have a change in my wife's condition I must have a change in doctors. Will you write me a note, saying Mrs. B. is no longer in your care."

In this case, had the druggist and friends understood the nature of this remedy, as I hope to show it, I should yet be in charge of one of my oldest and best loved families. This lady's affection for me and confidence in my professional skill was absolute. I had taken care of her sister in several similar attacks, though less violent, with the same medication, in the same doses. The husband, almost crazed with fear for his wife, did, as he supposed, his duty. It is, then, as a duty to the profession, that I lay before you to-night my experience with the hypodermic use of morphia.

In the year 1865 I made my first testings of hypodermic medication. I used it rarely, with great anxiety, and with morphia only. Until 1870 I never used more than one-quarter of a grain at a dose, generally one-eighth of a grain, or less; the teaching in general being that the strength was doubled by the hypodermic use. In this year (1870), assisted by my student, Dr. Pyle, then about to graduate, I had more than ordinary calls upon me for its use, and obtained such results as encouraged my confidence in the safety of the remedy. I became satisfied of the error of the then prevalent teaching as to its dangerous strength, began to take an especial interest in it, and to use it freely wherever severe pain presented with counter-indication for anodynes by the mouth. I have known convulsions to follow its use, but always had reason to believe that air had been injected with the medicine into the tissues. I never arrived in time to see the convulsions (though I could not doubt their occurrence), nor have I been able to note any after affect.

In the year 1870 I saw a colored man die shortly after the injection of half a grain, which at the time gave me great anxiety; but my subsequent experience convinced me it could not have been induced by the medicine. The case was one of renal calculus passing, Bright's disease being present.

The suffering was very great, and the first injection failed entirely to relieve; a second injection, given after two hours, scarcely made an impression upon the pain. About an hour afterward he suddenly become comatose, and died the next day. There was no post-mortem.

With these exceptions, I never saw an untoward effect of any character whatever, except the slight nausea, greater or less in proportion to the idiosyncrasy of the patient, not at all in proportion to the dose.

I was early taught to look upon opium and its preparations as our most efficient remedy in disease; to administer one grain of morphia without hesitation in the presence of otherwise uncontrollable pain; indeed, to control pain at all reasonable hazards; to look upon pain as nature's advance guard, useful only against surprise, its guns more dangerous to friend than foe unless at once, upon the onset of the attack, either called in or spiked.

My experience has led me to place dependence only upon half a grain of morphia as the ordinary adult dose in severe pain, to be repeated twice or thrice in twenty-four hours, if demanded. I have never repeated the dose more than three times daily, in any condition, and I have never given it to a child under fourteen years of age.

The usual effect of the half-grain dose is prompt and refreshing sleep within three to thirty

minutes, and lasting three to ten hours, and having a good appetite for two meals daily (noon and midnight), in all ordinary constitutional diseases.

The apparent delirium so common a result of partly subdued pain, so frightful to friends, I have never feared; have never seen result in any trouble; all the symptoms subsiding with the disease.

It is a question whether puncture should be made directly over the seat of pain or at a distance more convenient of application. My experience is this: in conditions of general rheumatism, peritonitis, delirium tremens, cancer, colic, etc., the system is equally influenced and pain subdued by selecting the seat of puncture. But in local neuralgia and rheumatism, in carbuncle, felon, etc., the local use is better.

Through it we have directed to the near vicinity of the diseased tissue a wound and a foreign substance. The increased vital action required to take up the medicament and heal the wound will at the same time act beneficially upon the local trouble and tend to heal the diseased tissues.

It has been asserted that morphia in rheumatism tends to increase heart affections. There exists a possibility that where the pain of rheumatism is early subdued, medicines to counteract the condition and tendencies to deposit may be too early discontinued, and the disease go on to injury; be this as it may, my record of cases with hypodermic treatment, always associated with other ordinary medicines, has fewer heart troubles than before such treatment.

In order to make this paper quite practical, I will detail some cases of hypodermic treatment.

Case 1.—Colored man, formerly my hostler; general rheumatism, pain over the entire body, unable to move, high fever. Ordered ordinary medicines, and gave hypodermic ½ gr. morphia. Sleep in three minutes, which continued all night, with profuse perspiration. Next morning repeated hypodermic, also on the following morning, when, all symptoms having vanished, I directed how medicines should be continued, and bade good bye. Result, perfect health.

Case 2.—Lady at Ocean Grove; general rheumatism. Found her sitting in bed, in which position she had already passed two days and nights, under homœopathic treatment. Ordered ordinary medicines and gave ½ grain morphia, hypodermically. Within three minutes she said "I feel easy." With assistance she was placed comfortably in bed, and was at once asleep. In the morning found her almost without pain, lying in bed as I had left her; repeated hypodermic; ordered medicines continned. Paid her no more visits. She has had no return of disease to this day.

Case 3.—Mr. F.; general rheumatism, subacute; had attended him before with same disease. This case was then very tedious, and on this occasion the condition resisted my treatment three weeks; pain almost continuous; patient declining hypodermics; at last consenting, they were used night and morning, with prompt relief of pain and steady progress toward recovery.

Case 4.—Lady, seen in 1874, in connection with Dr. C. A. Groff; general rheumatism, which soon settled in thigh and leg. The parts were enormously swollen, and I never heard such lamentations over pain. The stomach rejected all food and medicine. The case was tedious, lasting over four months. She assured me that medicine in her arm never did her any good *until it was put in her thigh*. She received half a grain of morphia morning and evening, controlling pain and restoring appetite. Gradually the dose was increased to one entire grain, and upon one occasion the patient continued to scream, and in an hour the dose of one grain had to be repeated, effecting sweet sleep for the woman all night and showers of blessings upon the Doctor next morning. During the last of the four months the hypodermics were limited to half a grain, once daily; since which time she has received none. Now reports herself never better in her life; no heart trouble, no head trouble; sound in mind and body.

Case 5.—Mr. C.; sciatica. At his request I treated him three months without hypodermics; no result. Then gave hypodermics, ½ to ¾ of a grain of morphia, night and morning, in connection with same medicine. Pain left at once, to recur shortly before the next hypodermic. At the end of four weeks it forgot to return. Hypodermics gradually discontinued during next three weeks. Result: perfect health; no relapse.

Case 6.—Mrs. N., wife of clergyman; sciatica, fourteen months' duration. Husband says she has tried old school and new school, Indian with herbs, old school again, heroic treatment, hot baths, sea shore, electricity; even Prof. Paine, who diagnosed "worms," system crowded with animalculæ, gnawing at her bones; proved it by showing them, by the microscope, in the mucus from the tongue. There they were, but there were just as many when he ceased treatment as when he begun. The pain was not abated until the magic of the hypodermic was called in, when, *presto*, the worms ceased to gnaw, pain slept,

strength came to the weakened muscles, and before the end of six weeks she ran a race with a company, to gain a car, at 12 o'clock P. M., and was the first to enter it. No relapse, now over a year. Treatment was ½ to 1 grain morphia, night and morning; withdrawn in gradually diminishing doses.

CASE 7.—Mr. S.; sciatica. Suffered for years; unable to raise leg, or walk without a limp. Tried every variety of medicine, the inevitable electricity also, with no relief. Two months' treatment with the hypodermic, ⅛ grain, increased to ¾ grain, night and morning, set him free. Two weeks ago he took cold upon exposure; now suffers slightly. I can cure him again with this little needle; I doubt any other power save the knife.

CASE 8.—Mrs. —; uterine neuralgia; seen in connection with Dr. Pyle, in 1870; had suffered for years. After coming under my treatment she received a hypodermic of morphia, ½ to 1 grain, once or twice daily, for six months. It was her custom to be in severe pain upon my arrival; to be asleep before I could replace the syringe in the case; to awake at 12 o'clock A. M. and P. M.; have her meals at that hour; again sleep until the return of pain, shortly before my arrival. This lady took about *three hundred* hypodermics; is now perfectly well; no return of trouble; no more hypodermics.

CASE 9.—Mrs. ——; puerperal fever; confined October 28th, 1876; chill on 1st of November. Treated with hard old opium pills, with other medicines, till the 17th of November, when she could retain nothing upon her stomach. Pulse 130, muttering delirium, intense pain, marked peritonitis. Gave hypodermic, half a grain of morphia, night and morning, which arrested the vomiting. For seven days she was fed with Wyeth's preparation of beef wine and iron, nothing else. The pain increasing, I gave three hypodermics daily, of one grain each; nothing less would relieve the pain. Mother and nurse both refused to care for her under my directions; said I would not let her die in peace. Her husband alone stood firm. Symptoms continued dangerous until November 23d. She passed the crisis at 4 A.M. I was at her bedside; the pulse reduced rapidly and she asked for ice cream. Her change from puerperal insanity to clear reason was the work of a moment.

November 30th, gave hypodermic, half a grain of morphia, at bedtime. December 8th, no morphia.

In January, 1879, I delivered her of a fine little girl, without trouble.

CASE 10.—Mr. ——; abscess in the region of the kidney. Prof. Agnew saw him with me, in consultation, August 1870. He was in bed six weeks before operation. During this entire period I gave him a quarter to one grain of morphia, by hypodermic, night and morning, with large and frequent doses of morphia, chloral and bromide mixture, during the intervals. This gentleman took two meals daily (noon and midnight), with a good appetite. To-day he is in perfect health; sound in mind and body.

Another case, similar in kind, and seen by Prof. Agnew at the same time (and treated without hypodermics), died from exhaustion, as I believe this man would have done without them.

I might go on giving cases in which I have given large doses of morphia hypodermically. Cases of delirium tremens, epididymitis, hysteria, etc., but I hope, gentlemen, I have said enough to convince you, and through you both druggists and people, that the hypodermic use of morphia against severe pain is safe, even in large doses; prompt, accurate, leaving less of evil on mind or body than any other method of administration; controlling the vomiting, soothing the pain, and holding in abeyance dire disease; so that the feeble flame of life may live through the storm and wake again to beauty and health after its fury be spent. I wish to remind you, also, that with a good needle the pain is much less dreaded by the patient than the trouble of being raised and the nausea of being dosed.

HOSPITAL REPORTS.

JEFFERSON MEDICAL COLLEGE HOSPITAL.

CLINIC OF PROF. GROSS, OCTOBER 25TH, 1879.

REPORTED BY FRANK WOODBURY, M.D.

Fibroma of the Mammary Gland.

The first case presented was a young woman, of nineteen, who had been troubled for a number of years with a tumor in her left mammary gland, for which excision of the breast was performed at this clinic one week ago. The growth had been very slow and painless until within a few months, when her attention had been directed to it by a more rapid increase. There was no retraction of the nipple, the overlying skin was natural in appearance. At the time of operation the tumor was thought to be a cystic fibroma, but subsequent microscopic examination by Dr. W. G. MacConnell proved it to be a pure fibroma, with very few adenoid elements.

Antiseptic vs. Simple Treatment.

Dr. S. W. Gross, of the surgical staff of the Hospital (who had performed the operation in

the above case), called attention to the simple character of the dressing usually employed here. "After the wound had been brought together by interrupted sutures and strips of adhesive plaster, a simple oiled compress was applied over the wound, which united throughout by first intention. Simple dressings only are employed at this clinic, but strict cleanliness is required in the instruments and dressings that are to come in contact with the wound. No use is made of carbolic acid; the instruments are not kept, for instance, in antiseptic solution before the operation; no attempt is made to operate under carbolized spray, and yet the results obtained in the operations at this Hospital, by simple dressings and ordinary care, are as good as could possibly be obtained had Prof. Lister's process been adopted. Out of five amputations of the breast recently performed all recovered save one, who died from shock. In the five major amputations of the extremities, thus far during the session, including one amputation at the hip joint, all have done well. No better results can be shown by what is called the antiseptic method than we have obtained by simple treatment."

Sebaceous Tumor of the Lip.

J. D., aged 20, presented himself with a small growth on the inner surface of the lower lip, near the angle of the mouth. Seven or eight years before he noticed in this situation a tolerably hard nodule, about the size of a small shot, underneath the mucous membrane. It remained stationary until about twelve months ago, when it began to increase. It never gave any pain, but it is inconvenient, from its size. On application the tumor was about as large as a small hazel nut or marble; rather dense, but not tender on pressure.

Prof. Gross said: "Many years ago, in my work on 'Pathological Anatomy,' I described a variety of cystic tumor of the lower lip, produced by the obstruction of the outlet of one of the mucous crypts or follicles that are normally found in this situation, and which may be easily seen in the natural condition by everting the lip and examining its surface. They normally secrete mucus, and when obstructed, a retention cyst is formed; such cystic tumors may be found in the mucous membrane of the nasal passages and pharynx, as well as in the mouth; they may also occur elsewhere, as in the vagina and on the mucous surface of the labia. They are of slow growth, and painless.

"The tumor in the present case appears to have more solid contents than would be found in a myxoma, and I take it for granted that it contains a good deal of adenoid material. It is not a cystic tumor, in the true sense of the term. It finds its analogue in the skin, in the sebaceous tumor, or wen, formed by the retained secretion of the sebaceous glands existing in large numbers upon the nose, the forehead, cheeks, scalp, and other parts of the integumentary system, in all portions of the body.

"There is only one treatment to be pursued, removal by the knife. Proceeding to excise the growth, I have now turned it out of its cavity. The entire cyst must be dissected out, for a small portion allowed to remain would lead to a speedy reproduction of the tumor.

"The wound is closed with a single stitch, and the patient dismissed with special injunctions to live on soft diet for a week, and to avoid exposure to cold. Every source of irritation must be avoided, in order to guard against erysipelas."

Case of Stone in the Bladder—Lateral Lithotomy.

"The next case, a boy of 13 years, has been troubled with symptoms of stone in the bladder for a long time. The patient is dull and stupid, and does not give a very definite statement as to the duration of his complaint, but says that he has suffered from trouble of this kind since infancy. He has no father nor mother, and is alone in the world.

"He presents all the rational symptoms of stone, objective as well as subjective. I have sounded him and satisfied myself of the existence of stone in the bladder; it is a large one, but I have not ascertained its dimensions by measurement.

"His general health is good. He eats well and sleeps well; the bowels are regular; there is no constitutional involvement whatever. The disorder is purely local; were it not for this bladder trouble he would be in a state of health. He has to pass his water every few minutes during the day and several times during the night.

Frequency of micturition is one of the common symptoms of stone in the bladder, and may be due to a variety of causes, or a combination of them. There is likely to be some cystitis present, which is maintained by the constant irritation from the presence of the stone. When the calculus is very large it impinges upon the neck of the bladder and causes frequent desire to pass water, although only a small quantity is expelled at a time. The calculus also causes pain in micturition, and when it occurs at a very early age we find children, thus afflicted, constantly in the habit of pulling at the head of the penis and foreskin, in attempting to relieve the irritation of the neck of the bladder. In this manner an elongated prepuce is formed, which is one of the objective signs of stone. Then we have very often a urinous smell about the person, due to the contact of the urine with the patient's clothing; and we may often observe the patient walking about with his hands in his pocket, tightly grasping the head of the penis, with a view of affording relief. This pain extends from the seat of irritation, in the pernieum, along the urethra, and is felt at the end of the penis; it may also be carried down the thighs, or be felt in the lumbar region.

"The urine becomes very decidedly changed. It has a marked sediment of muco-pus and earthy salts. In advanced cases it may even contain renal casts, and occasionally albumen. The flow of the urine is sometimes interrupted by the stone falling against the neck of the bladder, causing severe pain, and obliging the patient to change his position and assume some unusual attitude, in order to pass his water. Even where these subjective symptoms are present, the true nature of the case can only be determined with precision with the aid of a nickel-plated steel instrument, called a 'sound,' which I have fre-

quently described to you; it is introduced like a bougie, but after entering the bladder it is turned in various directions in the effort to encounter the stone, which manifests itself by its resistance and by the audible "click" elicited on striking its surface. Very often the sound comes in contact with the stone in the bladder immediately upon entering its cavity. We are always anxious, not merely to find an obstruction, but particularly to elicit the click. If the search be unsuccessful the patient should be allowed to rest for twenty-four or thirty-six hours, before the examination is repeated. It very frequently happens that a stone exists but it cannot be found at the first examination, but on a subsequent occasion no difficulty will be experienced in demonstrating its presence. At all events the surgeon should be sure not to open the bladder until he has by this means positively ascertained the existence of a calculus.

"At the time of examination there should always be some urine in the bladder, from four to six ounces in an adult, from three to four in a child. If there is too much fluid a small stone may escape the sound, if too little, the movements are restricted, and the stone may be encapsuled or buried in the walls.

"The patient's general condition should always be inquired into; he should never be sounded when fatigued after a long journey. Nor should lithotomy be performed unless the system has been prepared by proper treatment. Quinine and anodynes will be found useful, but a nourishing, non-stimulating diet, with perfect rest for a few days, are essential. The bowels should be well evacuated by a dose of castor oil, on the night previous to lithotomy, and just prior to the operation the lower bowel must be emptied by a large warm-water injection.

"After the chloroform has been administered by Dr. Hearn, I propose to perform lithotomy by the lateral method, making the incision on the left of the raphé of the perineum, as is my custom. The external wound is made about midway between the verge of the anus and the scrotum, in the adult about 1½ inches in front of the anterior anal border. The knife is carried from this point obliquely backward and outward, in a line midway between the anus and the tuberosity of the ischium. In the present case the incision need not be more than an inch in length; if necessary, it can be subsequently enlarged.

"The wound need not be so large in a child as in an adult. I ordinarily make my incision very small at this time of life. The skin and superficial layer of fascia are divided at the first cut, with some of the external hemorrhoidal vessels; the next structure divided is the transverse perineal muscle, with its artery and nerve; finally, the deeper layer of the fascia is opened, and as the knife enters the bladder, the membranous and prostatic parts of the urethra are divided, with the left lobe of the prostate gland. The incision in the prostate, in a child, should be small, as the wound in this organ is easily dilated with the operator's finger; very different from the prostate of advanced life, where the gland becomes tough, dense and inelastic. The finger having followed the staff into the bladder, and encountered the stone, the stone forceps are to be introduced along the finger and an attempt made to grasp the concretion, with its long diameter parallel with the blades. The stone being firmly seized, is withdrawn with a gentle movement, in very much the same manner that the obstetrician delivers the head of the child with his forceps.

"Sometimes troublesome bleeding follows lithotomy. From the long continued irritation the small hemorrhoidal vessels in the neighborhood become distended and hypertrophied, and produce oozing, which, however, may be generally controlled by cold applications. The transverse perineal artery, as it runs by the side of the transverse muscle, must necessarily be divided, but the vessel is small and rarely produces trouble. A greater danger consists in wounding the artery of the bulb, a branch of the internal pudic, when the incisions are carried unduly high. The bleeding from this is much to be dreaded, as it is deep-seated, and on that account difficult to ligate. The bulb of the corpus spongiosum may, in like manner, be wounded, and, being very vascular, will give considerable trouble. When the incision is carried too far outward, it is said that we may wound the internal pudic artery, as it runs along under the border of the ischium, but I have never seen this accident.

"Prior to lithotomy, the perineum of an adult must be shaved, and during etherization it is well to have the penis secured, so that the urine does not escape before the operation.

"The patient being ready, he is brought down so that the breech projects over the end of the table, the staff is introduced, with its handle slightly inclined to the right, so as to make the left side of the perineum prominent; the thighs are moderately flexed on the pelvis; if flexed too strongly it makes the perineum too bulbous and tense. The bowels are thoroughly evacuated by the oil and enema, for two reasons, first, because if the rectum were distended with fæces it would be in danger of being wounded by the knife, and secondly, because I make it an invariable rule to lock up the bowels for five or six days after the operation, sometimes even for eight days, so that the bladder will not be disturbed by the contraction of the parts. As a preliminary step in the operation, it is customary to introduce the left forefinger into the rectum, with the view of making the sphincter contract and draw the gut away from the knife, but more especially with the object of ascertaining the position of the staff, which, as you know, is provided with a groove in its convex surface, along which the knife passes into the bladder. The wound should be made obliquely, and not carried straight down, as recommended by the books and practiced by most surgeons. As there was a very tight prepuce in this case, preliminary circumcision was required."

[The operation having been performed, a stone as large as a hazel nut was extracted. It had the appearance of an oxalic acid or mulberry calculus.—Rep.]

"The patient shall have a full dose of laudanum, as an anodyne, as soon as he comes out of the anæsthetic sleep. In the meantime he shall be carried to bed, and placed on a draw-sheet, under which is an oilcloth, to protect the mattress. The draw-sheet is necessary to receive

the discharges, and promotes cleanliness, because it may be frequently changed. The urine will escape, for about twenty-four hours, through this opening in the perineum; then the lips of the wound will be closed by swelling, and the water will pass through the natural channel for the succeeding twenty-four or thirty-six hours. By this time the swelling will have subsided, and the urine will escape by the wound until it finally closes by granulation, in the course of a week or so.

"This concretion is a mulberry calculus, the worst of all to produce pain, on account of these irregularities of its surface, from which its title is derived. It is hard, dark colored, and tuberculated; this variety is very uncommon in comparison with the uric acid calculus, which is the one generally met with. These concretions often have as a nucleus small renal calculi that have been formed in the pelvis of the kidney and passed down the ureter, upon which successive layers of deposits may take place. Stones may, however, originate in the bladder, from the urinary salts, or from shreds of fibrin, or other substance acting as a foreign body."

Lithotomy by the Lateral Operation, by Dr. S. W. Gross.

Dr. S. W. Gross presented the next patient, also a case of stone in the bladder, who had been kindly sent by Dr. Cruice, of Chester.

The patient, a man of 62, has had symptoms of vesical trouble for a number of years. An examination was made one week ago, and a stone was detected immediately on entering the viscus. Upon introducing the finger into the rectum, the stone was found resting upon the *bas fond* of the bladder.

The urine was alkaline, not albuminous, but contained phosphates and urates, in abundance, with clouds of mucus; it was passed frequently, with the usual pain and strangury.

"The most marked point of difference between this case and the preceding is in the state of the prostate gland. In old persons the prostate is apt to become enlarged and increased in density, especially so when the constant irritation of a stone is present; in this case it appears to be less hard than usual. Referring to the anatomy of the part (as illustrated by a diagram on the board), we recall the fact that the posterior layer of the deep perineal fascia (a part of the triangular ligament), embraces the prostate gland so as to make it a pubo-prostatic ligament. This is important to be borne in mind, for in making the incision in the prostate gland it must not be carried too far posteriorly, because if this posterior layer of the deep perineal fascia be divided, there is a prospect of infiltration of the urine into the pelvic fascia and loose tissue between the bladder and rectum, leading to diffuse cellulitis, and probably death from peritonitis. In the child the prostate is very distensible, and we must limit the incision to half an inch, depending upon dilatation and laceration with the finger to accomplish the rest; in old men this cannot be readily done, and the further use of the bistoury is often unavoidable. The incisions, however, should be kept in front of the base of the gland. There is another danger to which our patient is exposed in enlarging the incision. Around the neck of the bladder we find situated the vesico-prostatic plexus of veins, which, being enlarged by the constant irritation, become the greatest ordinary source of hemorrhage after lithotomy in old subjects, as the vessels are dilated and varicose, and have no valves. They are, moreover, liable to absorb from the wound and to carry into the blood the products of inflammation, and cause septicæmia, or lead to fatal peritonitis. We are also likely to have more bleeding, in old persons, from the external hemorrhoidal vessels, than in a child. These constitute the principal points of difference that exist between this and the preceding case, if we except the relative greater size of the parts and the deeper perineum.

"In considering the sources of hemorrhage, it should not be forgotten that the artery of the bulb may take an abnormal origin from the internal pudic, even as far back as the ischial tuberosity. In this case it would of necessity be divided in the operation and require ligation. In old persons the bulb of the corpus spongiosum is more relaxed, and care is required to avoid it, as it is sometimes not more than half an inch in front of the anus. By inserting a finger into the bowel it can be drawn backward, away from the bulb. This allows the free division of the membranous and prostatic portion of the urethra, with about half an inch of the left lobe of the prostate gland; we then dilate the wound by introducing the finger into the bladder before withdrawing the staff.

"The danger of lithotomy increases with the age of the patient. In old subjects between four and five out of ten die, while in children we expect all to recover. Professor Gross concurs in this opinion, and says that he has cut seventy-two children with only one death.

"The method of operation is identical with the preceding case, except that the incision will be a little longer, beginning at a point one inch and a quarter in front of the anus. The deep incision shall not be so large, the wound decreasing in size as it descends. Where enlarged prostate complicates stone in the bladder the prognosis after operation is unfavorable. The last four cases of this kind operated upon at this clinic all died."

[The patient being influenced by ether, the lateral operation was performed, and a large uric acid calculus, weighing — grains, was removed. No bleeding followed. The bladder was carefully syringed out with warm water, to remove any debris or fragments of stone, and the directions for after treatment were given, as in the first case.—Rep.]

Stricture of Urethra, with Cystitis.

H. S., forty-seven years of age, had gonorrhœa twenty years before, and suffered from stricture for five years. One year ago his stricture was divided at this clinic, but it has again returned. He now has frequent micturition and severe pain, showing that he has also cystitis. The patient weighs upward of two hundred pounds, and, were it not for this trouble, he would be a stout, healthy man.

Prof. Gross brought the patient before the class for the purpose of performing perineal sec-

tion. He said that he had no doubt that by performing internal urethrotomy he could reach the bladder, but his object in making the external incision was to provide free drainage for the bladder, and thus relieve the cystitis. The urine will not then be retained in the bladder, but allowed to drain away as fast as secreted.

"There are no sinuses in the perineum in this case, as there usually are in old, tight strictures, and in view of this, we conclude that the urine is not escaping into the connective tissue.

"External urethrotomy is not infrequently performed in cases of bad stricture. It consists in introducing an instrument into the urethra as far as possible, and cutting down upon it in the perineum, where it serves as a guide for the knife. The incision is carried along the instrument, through the membranous portion of the urethra and the neck of the bladder.

"In such cases there is always an amount of mucus and pus in the urine, giving a thick, viscid deposit. The term cystorrhœa is sometimes used to designate this condition. Now and then renal casts and albuminuria appear, although rarely. The amount of urine is sometimes remarkably great; in other cases there is less water, and the sediment is so adhesive and tenacious, that a vessel containing it may be inverted without spilling its contents.

"The operation proposed will afford the patient much relief, as it will divide the neck of the bladder, and will not only prevent any accumulation of urine, but will permit the use of sedative and detergent injections.

"Stricture is almost always the result of gonorrhœa, neglected or badly treated. As a result of the mucous inflammation fibrin is poured out, and becoming organized is converted into a fibrous tissue surrounding the urethra, which acts mechanically by preventing the dilatation of the tube and by showing a decided tendency to contraction. This is shown more particularly in the membranous portion of the urethra, which is naturally the narrowest portion of the tube, and is located between the superficial and deep layers of the deep perineal fascia. Strictures do not occur further back than this; although the prostatic portion often—perhaps in the great number of cases—is inflamed, there is no submucous deposit of fibrin, and it does not give rise to stricture; at least this is my experience, and that of other surgeons.

"I find a very tight stricture here. I have now succeeded in passing this first obstruction, and find an impassable constriction behind it. On a number of occasions I have succeeded in performing this operation without having an instrument in the bladder, but our patient is not the best subject in the world, and I will desist for the present. I have frequently noticed that fat people are not good subjects for operation.

"This patient shall wait until the next clinic day, and in the meantime an effort will be made to get a small instrument into the bladder. He has been taking quinine for some time, to prepare him for the operation, and on going to the ward he shall have fifty drops of laudanum, and be kept perfectly quiet for the rest of the day."

Medical Societies.

PROCEEDINGS OF THE STATE MEDICAL SOCIETY OF VIRGINIA.

REPORTED FOR THE MED. AND SURG. REPORTER.

This Society held its tenth annual session in the city of Alexandria, October 21st, 1879, with a respectable attendance of Fellows and several eminent physicians from the adjacent cities of Washington, Baltimore and New York.

Of the two thousand physicians in the State, three hundred and eighty-seven are members of the Society, eight of whom have died during the past year. In the course of the address of welcome, Dr. Powell, of Alexandria, said, "There never was a time in the history of medicine when the means, processes and appliances for obtaining facts were as varied and numerous as now, and never before did experimental researches in pathology and physiology yield such fruitful results to well-directed labors."

The annual address to the public and profession was by Dr. Oscar Wiley, of Salem, Roanoke, who discussed in an eloquent manner the theme of "the Reflex Influence of Lives Devoted to the Healing Art." He was followed by the President, Dr. L. S. Joynes, of Richmond, who entered at length into the laws of the State which bear upon the medical profession adversely, and pointed out how an amendment of them could be secured. He adduced a number of examples of country physicians, Jenner and others, who had rendered distinguished services to humanity and the profession. He deprecated factious differences between physicians, as differences of opinion in medicine, as in all other matters, must ever occur. He urged the members to work together for the alleviation of human misery and the good of mankind.

An interesting paper upon Hygiene and Public Health was read by Dr. S. K. Jackson, of Norfolk, in which he strongly urged continued investigations into the perturbing cause of yellow fever, believing that final success will crown the efforts of the investigators.

A committee of five were appointed to report on a plan for the organization of a medical or Mutual Aid Society in this State, and when advisable, to submit the same to the consideration of, and urge its adoption by, the American Medical Association. Dr. Frederick Horner, Jr., addressed the Society on the feasibility and advisability of such an organization, to embrace all physicians who are Fellows of the State Medical Society, with the view of furnishing relief to the disabled and assistance to the families of those who die. He cited various examples of such societies in other States and other professions.

The resolution on this subject was unanimously adopted, with instructions to the committee to consider it especially in reference to its relation to the profession in Virginia.

Dr. W. C. Dabney, of Charlottesville, read a paper on Sutural Reunion of Divided Nerves.

Four committees, each to consist of three members, were appointed to report on the mine-

ral waters of Virginia; one on the thermal waters; one on the sulphur; one on the lithia and magnesia; and one on the alum and chalybeate, to embrace all the medical qualities of the waters and their uses in sickness.

It was agreed that hereafter the President be elected by the vote of the whole Society, and not upon a recommendation of a nominating committee. The resolution was endorsed by a decided majority.

On reassembling, the second day of the proceedings, Professor Hunter McGuire read a very interesting report of two cases of Battey's operation successfully performed by himself.

Dr. J. Marion Sims complimented Dr. McGuire for the interesting accounts just read, and was warm in his praise of Battey's operation.

Dr. McGuire thought that, except to save life or prevent insanity, the operation should not be performed.

Dr. Sims coincided with Dr. McGuire in the danger attending the operation.

Dr. H. P. C. Wilson, of Baltimore, was profuse in his praise of Battey's operation.

Dr. Wilson read a paper on his thermantidote, an instrument to prevent burning the soft parts in the operation with Pacquelin's cautery, and exemplified its use by experiments.

A vote of thanks was tendered Dr. Wilson for his useful discourse and interesting experiments, and his paper was ordered to be published in the Transactions.

Dr. Sims praised the invention of Dr. Wilson, and in this connection gave some very interestings facts in reference to neuralgic affections, and their cure by cauterization, with the modesty of true merit and the eloquence which distinguishes his utterances on occasions of the kind. Dr. Sims referred to his successful treatment of abscess of the liver, marked, according to the experience and observation of Hammond, Brown-Séquard, and others, by obscure symptoms of cerebral congestion, and even of insanity, and by no means readily detected. In the person of the eminent medical journalist, Dr. Gaillard, of Louisville, for several years past a hopeless invalid, was lately exhibited an example of this uncommon disease. Himself and Dr. Hammond operated on Dr. Gaillard, with success, and to the great relief of the patient and his friends.

Dr. J. M. Toner, of Washington City, read an interesting sketch of the life of Dr. James Craik, Washington's physician and friend.

The Treasurer's report showed a balance in his hands, after paying all expenses, of $2.58. The collections have been $1178.

Dr. Kerfoot moved that the subject for discussion at the next annual meeting be "Tobacco, its Uses and Abuses in Health and Disease." Lost.

The subject agreed upon was the "Summer Complaint of Children."

On the afternoon of the third day, and after the election, as President of the Society for the ensuing year, of Dr. Henry Latham, of Lynchburg, and the selection of Danville as the next place of meeting, the Society adjourned *sine die*.

FRED. HORNER, JR., M.D.

The full Transactions will appear, as usual, in the *Virginia Medical Monthly* at an early date.

NORTHERN MEDICAL SOCIETY OF PHILADELPHIA.

Dr. D. M. Barr read a paper on

The Hypodermic Use of Morphia.

Given on page 423.

Dr. A. M. Slocum thought half a grain more than the customary dose. He usually gave one-eighth to one-fourth of a grain. His experience with the instrument was not great, but favorable. He never had any local inflammation follow its use.

Dr. L. B. Hall had not used the instrument, except in cases of severe pain. Considered half a grain of morph. sulph. an ordinary dose under such conditions. On one occasion he repeated the dose, giving one and one-fourth grains within an hour, with happy effect. Had seen a local abscess follow in two cases. He was then using Magendie's solution. Now carries half-grain powders, and washes needle in alcohol on return to office. Since taking these precautions has had no trouble. Once obtained an instantaneous effect, and suggested the direct introduction into a vessel as the possible cause.

Dr. N. Hatfield limits the use of the instrument to cases of severe pain, as after a severe injury. He prepares the solution at the time of using. Considered one-quarter of a grain the usual dose.

Dr. I. G. Heilman generally uses it in cases of severe pain, as cholera morbus, etc. Usually gives one-eighth to one-fourth of a grain.

Dr. E. R. Stone considered half a grain a large and unusual dose. In one case, however, he began with one-quarter of a grain and repeated the dose until he had introduced one and one-half grains within an hour. He then obtained relief, with no bad after effect. He makes the solution at the time of using. Never obtained any bad effect. In one case in which the patient had become accustomed to half a grain twice daily, he suddenly ceased giving it, and used an injection of water, with the same effect upon the patient, he supposing it to contain morphia as usual. He asked Dr. Barr if he had ever known the patient to acquire the opium habit through the use of the hypodermic.

Dr. Barr knows of no one who uses the syringe at home. The fact that so many of the profession consider half a grain an unusually large dose is what lost him his patient, through the aid of the druggist, and is his reason for reading the present paper. In answer to Dr. Hall, he believed the sudden effect to be due to direct introduction into a vein. The bad result he thought proceeded from the introduction of air into the tissues. He had carried an instrument until it had become so rusty that it was impossible to use it, yet without bad effect. He liked the idea of cleansing the needle with alcohol.

—The British Army and Naval service, like our own, is suffering from a scarcity of medical applicants. Let the governments make the inducements greater, and this scarcity will disappear.

Rest, Pressure and Dry Dressing in Wounds.

In a lecture on this subject, in the *Lancet*, Mr. Samson Gamgee, F.R.S.E., gives this case, and remarks—

I was consulted a short time since in the case of a middle-aged gentleman, of full habit, but without gouty history. Two months previously, while cutting the big toe nail of the right foot, he injured the end of the toe. It swelled and became painful. He had the advantage of attendance by two very able practitioners, who applied a variety of lotions, fomentations, and poultices, partially excised the nail, and had, in fact, as I was assured, done almost everything. The patient, in robust health, was confined to his bed, wholly disabled by the exquisitely painful toe. When I visited him in consultation I found a bread poultice secured on the end of the toe by means of a handkerchief crossed over the ankle. So timid was the patient that it was only after some little persuasion that he would allow me to remove the poultice. This done, and all its particles gently wiped off with a piece of dry, soft lint, I exposed a big, tense, shiny-red toe, exquisitely tender to the slightest touch. In the place of the nail was a dirty, reddish-gray sore. This I covered with a thin layer of muslin soaked in a solution of borax and glycerine. I enveloped the foot and ankle in a layer of fine cotton wool, applied a piece of moistened pasteboard to the sole of the foot, extending from a little beyond the heel to half an inch in front of the great toe, broad enough to embrace the tread of the foot. Across the ankle I placed two diagonal strips of moistened pasteboard, and fixed the whole with a smoothly but steadily compressing bandage. The dressing was completed by fixing, with a few turns of bandage, a dry pasteboard splint to the sole of the foot, and securing the lower part of the limb in the hollow of a pillow, tied round it with a couple of pieces of bandage. The patient was immediately comfortable, and continued so. He passed a good night, and when I saw him next day was quite easy. On removing the dressing, after twenty-four hours, the toe was comparatively pale and shrunken, and could be handled comfortably. I reapplied the same dressing, but with firmer pressure. Forty-eight hours later improvement continued without interruption. I found the toe still further reduced, and as the sore, though cleaner, was not yet quite clean, I brushed over it, and into the crevices at its root and sides, with a fine camel-hair pencil dipped in the following lotion:—Borax, half a drachm; compound tincture of lavender, a drachm and a half; glycerine, an ounce and a half; water, six ounces. This application did not cause the least pain; and when I had once more immobilized and compressed the foot, I was able to drop it from the height of a couple of feet on to the couch without the least discomfort.

Valuable as dry dressing is in all recent wounds, lotions similar to the foregoing in composition are of essential service, when rightly employed, in foul wounds and old ulcers. The term "detergent" of the old surgeons has lost none of its fitness, and the therapeutic agents which it designates have lost none of their practical usefulness.

In the case now under consideration the result was largely due to absolute rest. The value of rest no one questions; but what is needed is a more clear and precise understanding of the means to be adopted to carry it into effect. Rest, to be of real service in the multitude of surgical cases which are benefited by it, must be, as nearly as practicable, *absolute;* and the construction of immovable apparatus, suitable to the exigencies of particular cases, will be found to tax the ingenuity, and to demand the nicest combination of gentleness and strength. Pressure was another great factor in my patient's improvement. It was so partly, no doubt, as an aid to immobilization, in unifying the parts of the apparatus and fixing the ankle and the smaller joints of the foot. But it must always be borne in mind that, whereas comparatively slight pressure, if hard and circumscribed, is painful, uniform, smooth, elastic pressure, accurately applied, is most soothing. It acts by controlling the local circulation, preventing extravasation, promoting absorption of interstitial deposits, and lulling, to impotence for mischief, muscular spasm, that most potent cause of local and constitutional unrest.

A wrist joint, hot and swollen after a heavy fall on the hand; an ankle, after a slip and a twist, grown big, and mottled and tender as a boil; a woman's pendulous, hot, tender breast, breeding an abscess; the fleshy, jumping stump of an amputated thigh, are one and all relieved, as if by magic, under steady, uniform, elastic pressure.

The Cold Douche in Coma.

The following case was reported to the clinical Society of London, by Mr. Keetly:—

The patient was a groom, aged 30, who was thrown from his horse into a ditch, alighting on his head. There had been a short period of insensibility, but on admission to the hospital he was conscious and irritable. The accident had happened at 5 P.M., and at 6 the next day, having passed a quiet night, he was seized with a convulsive attack, confined to the left side. During the day he had several similar seizures, in which his eyes were strongly turned to the left; in the intervals he vomited occasionally. On the third day he remained in much the same condition; but on the fourth the right side was affected; and after the attack this side was found to be paralyzed. Toward evening he improved considerably; and on the following day it was noted that his face was heavy, his pupils contracted, and he resembled a patient suffering from opium poisoning; the temperature was 100°. On the sixth day the coma was increased; temperature 100°, pulse 120; the cold douche was applied to

the head for two hours and a half; the temperature was 99°, pulse 70; his face rather blue; he could answer questions, but had a fatuous expression, and his answers were often childish. After this time he steadily improved, and ultimately recovered. A fracture of the posterior fossa was diagnosed, extending to the base of the skull, the severity of the injury and the severity of the meningitis appearing to point to such a condition. The epileptic seizures at first appeared to point to an injury of the dura mater, over the seat of violence; and the later attacks on the opposite side to an extension of the inflammation to the meninges of the other hemisphere. There was no difficulty in regulating the time during which the application of the douche was beneficial. The blueness of the lips was only noticed after more than two hours of this course of treatment. It should be added that he had previously been treated by an ice-bag to the head, and the administration of aperients.

Treatment of Prolapsus Ani.

Dr. J. B. Gill writes to the *Lancet*, on the treatment of this trouble—

Why should ergotine, or, in fact, any poison, be employed, so long as cases of the kind prove perfectly amenable to more gentle treatment? Allow me to quote a case; it is one of a series, and typical.

J. W., aged fifty, a well-to-do tradesman, came under treatment in June, 1866, a victim of prolapsus ani. He had suffered from dyspepsia throughout life, and had when he visited me an ulcer, the result of eczema, on his right leg. I gave him strict injunctions as to diet, and directed that he should instruct a builder to make him a box stool, containing the wherewithal to pump a stream of water on to his perineum. He carried out my instructions, and within two months completely cured his prolapsus. The prolapsed portion of the rectum was about four inches in length. It had existed for several years.

Reviews and Book Notices.

NOTES ON CURRENT MEDICAL LITERATURE.

——In a paper on "What is the best Method for the Care of Poor and Vicious Children," the well known philanthropist, Mr. Charles L. Brace, recommends that they be placed in families in country places, rather than in large asylums or "Homes." He observes:—

"Our large congregated reformatories ought to feel that they are 'behind the age' in their plan, and sell their valuable 'plant,' and buy large, cheap farms, and put up 'pavilion' cottages; using the interest of their considerable capitals in providing teachers and overseers to take charge of their 'groups' or cottage families. They would not have so much to show to the public in bricks and mortar and machinery, but they would do far more good."

BOOK NOTICES.

Yellow Fever A Nautical Disease—Its Origin and Prevention. By John Gamgee. New York. D. Appleton & Co., 1879. pp. 207.

Mr. Gamgee is well known as an inventive man of science who has made long and important studies of the diseases of the lower animals and of chemistry and physics in the applied forms. In the volume before us he discusses the problem of the origin, spread and prophylaxis of yellow fever.

Its origin he believes to be in the holds of ships long sailing in the tropical latitudes of the Atlantic ocean. Putrefactive changes take place in their confined spaces; foul air and water and intense heat combine to develope a virus of intensely poisonous character, which may infect the less poisonous putrescent materials of seaport towns. He likens yellow fever to typhus, and calls it *nautical* typhus. It is, in his opinion, a disease confined strictly to the sea and parts immediately adjacent. It is not contagious, does not depend on "germs," and is not communicable except when the peculiar poison has the above mentioned facilities for self-propagation, the most indispensable one of which is *heat*. A moderate degree of cold, to a little below the freezing point, absolutely destroys the morbific agent.

This suggests the remedy. Let the hold, the wood work, the rigging, the cargo of an infected ship be all thoroughly frozen, so that the cold, dry air penetrates every part of it, and the yellow fever is utterly and permanently destroyed in that ship until a re-infection. Can this be done? Mr. Gamgee answers yes; he is ready to do it. He has designed a "refrigerating ship" which can be employed for this purpose; and he is anxious that our government should interest itself, and have one constructed, to test the matter practically.

Mr. Gamgee does not claim originality in this suggestion. Years ago it was made by Dr. Faget, of New Orleans, and the present author gives him his full meed of credit. It has never yet been fairly tested. The ships which sail from the West Indies to Boston in the winter maintain fires, so that they are not thoroughly refrigerated.

Without discussing the theoretical portions of Mr. Gamgee's work, his practical suggestion is plausible, and it ought to be put in practice. It will do good, even if it fails of the anticipated result. It has probabilities in its favor, and if it succeeds, the result will be of incalculable good.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Half-Yearly Compendium of Med. Science,	2.50
Reporter and Compendium, - - -	7.00
Physician's Daily Pocket Record, - -	1.50
Reporter and Pocket Record, - - -	6.25
Reporter, Comp. and Pocket Record, - -	8.25

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

PHILADELPHIA, PA.

EDUCATION, AND THE STUDY OF MEDICINE.

Whatever Professor VIRCHOW says is worth reading and thinking about. And when, in accordance with appointment, he handled the general subject of medical education, at the last International Congress, at Amsterdam, he made, as usual, some admirable suggestions.

Much of his discourse was taken up with the relation which classical education bears to the strictly medical one. Is it worth while diligently to foster the study of Greek and Latin in those destined to become physicians? VIRCHOW acknowledges the striking lapse of classical knowledge in the last generation. When he was a student Latin was a common medium of instruction in the German universities. Now it would puzzle the present professors to speak it, and if they did, most of the students would not understand them. Very few, indeed, of his medical friends have ever read Hippocrates in the original Greek.

Yet, he insists, there are advantages to be derived from a classical course, which cannot be gainsaid. First, there is the external advantage of maintaining the profession at a higher social level. A classical education guarantees a certain amount of early culture and better associations, and for this reason counts something in an individual's status. Then there is the advantage of greater accuracy in the use of words. Without some knowledge of the dead languages, especially Latin, the student does not appreciate the positive meanings of words. VIRCHOW illustrates this by the word *tuberculosis*, used as far back as at the time of Hippocrates, but whose meaning is constantly altered by new and careless writers.

He acknowledges frankly that since the Latin is no longer used for medical writing or teaching, there is no direct necessity for the medical student to acquire it; but he distinctly claims for the classical tongues that they are the most effective means ever found to develop the young mind and to widen its intelligence. The much talked of *Realbildung*, the "objective method," or the "genetic method" of education, might, indeed, profitably come in for a share of the attention of educators, but they cannot supplant the study of languages.

The worst fault in modern education is the surprising inaptitude for *observation* which it seems to leave behind it. In his lectures VIRCHOW repeats ten times, perhaps, the same thing, and yet, after all, finds his students have not *seen* what he has shown them. More than any other deficiency, he would have that corrected. Let the young man learn to observe and to see. Let him learn early to use his senses, and accurately to express the sensations which he feels. These are the two *desiderata* in modern education.

With more especial reference to the medical instruction in Germany, VIRCHOW expressed his belief that it is too exclusively oral; books are too little used; the professor comes too much to the front. He wishes the student to read and study good manuals, to follow closer the written text, and not depend so much on the professional orator. Many parts of medical science are read much more profitably than they are heard, and

the professor should chiefly confine himself to matters of experience and observation.

The views here expressed by VIRCHOW are not dissimilar to those in an address on the same subject by Dr. AUGUST DUPRÉ, at the opening of the current course in the Westminster Hospital, London. He, too, finds that on the one hand a strictly classical preliminary education forces thought into a narrow compass, while on the other, a scientific or technical one exclusively dwarfs the powers of the intellect itself. He records the striking fact that in his earlier years the late eminent Baron Liebig expressed his conviction that a new national life would commence for Germany, and that future generations would, in consequence of their increased knowledge of natural science, be intellectually superior to past generations, brought up chiefly in the old classical schools.

Unfortunately, this bright vision has not been realized, and Germany is reverting more or less to the old style, convinced of its greater wisdom. Liebig himself confessed, in after years, that his earlier opinions had been erroneous. He stated that he frequently observed among his own students in chemistry, that although those coming from technical schools appeared at first, in all that related to natural science, as giants compared to those having received a chiefly classical education, yet that the latter, in most cases, not only soon made up their deficiencies in this respect, but in the end generally outstripped their technically educated rivals.

AIDS TO DIGESTION.

There seems to be quite a diversity of opinion as to the medicinal value of the various digestive ferments which have been from time to time presented to the profession. This was illustrated quite recently, at the German Association of Naturalists and Physicians, which assembled at Baden. Several articles were read on the subject. Trials with the different preparations found in trade showed that nearly all German preparations were inert, while the only English preparation which was tested gave satisfactory results. Professor KUSSMAUL, finding that pepsine was always present in the gastric juice, even in very inveterate cases of gastric catarrh, does not believe that the administration of pepsine can be of much use at any time, and doubts the improvement alleged to have been witnessed, on this purely theoretical ground.

Last August the same question was brought before the Parisian Academy of Medicine. Professor VULPIAN, Dean of the Faculty of Medicine, read a memoir by M. MOURRUT, on artificial digestion, embodying his researches on the value of the different digestive principles. M. MOURRUT finds that the action of diastase is considerably retarded by the addition of an acid, while that of pancreatine is entirely abolished. If, after two hours, the acid solution is neutralized, diastase rapidly regains its sugar-forming property, but this is not the case with pancreatine, which remains inactive with respect to starch, and most probably also to albumen. With regard to pepsine, which is extensively used in the form of wines and elixirs, M. MOURRUT assures the Academy that the quantity of alcohol in these preparations suffices to render them useless, and concludes that they should be proscribed in future by the prescriber. And the more so as many of the most renowned elixirs sold contain traces only of the ferment to which they are supposed to owe their virtue, the rest having been precipitated, no doubt, by the alcohol in the preparation.

On the other side, Dr. WILLIAM ROBERTS, of Manchester, succeeded in completely peptonizing milk with properly prepared pancreas extract, and has thus opened out quite a new line of treatment for gastric disturbances. Pancreatic digestion is evidently beginning to interest the therapeutists as well as the physiologists, and it may be placed in the position which Dr. HORACE DOBELL assigns it. It is well known that for years he has been urging its claims on the medical public, who, however, have given but partial attention to the long array of facts in its favor which he has cited. Possibly the time will come when this and other ferments can be used with an accurate appreciation of their relative physiological effects.

Notes and Comments.

Therapeutical Notes.

BISMUTH IN ULCERATED OS.

℞. Bismuthi subnitratis,
Glycerinæ, āā q.s. to make a thick cream.

Dr. Suesserott recommends gynecologists to use this in preference to other applications to ulcerations of the os and cervix uteri. He applies it through a glass tube, and retains it by a pledget of cotton.

CANTHARIDES IN GLEET.

℞. Pulv. cantharidum,	gr. ¼	
Olei terebinthinæ,	gtt. v.	M.

Sig.—For one pill, thrice daily, in obstinate gleet.

This is reported as very efficient in old and refractory cases, by a writer in the *Southern Clinic*, October. Should strangury be brought on, discontinue for a day or so.

IODOFORM IN FISSURED NIPPLES.

Dr. M. O'Hara, of the Obstetrical Society of Philadelphia, has found the following application to fissured nipples very satisfactory, and giving prompt relief to pain:—

℞. Iodoformi,	℥ ss	
Collodion,	℥ j.	M.

Sig.—Paint on the part from time to time.

ECZEMA INTERTRIGO OF INFANTS.

℞. Plumbi acetatis,	gr. xxx	
Acidi acetici diluti,	℥ ij	
Glycerinæ,	℥ iss	
Aquam rosæ, ad	℥ viij.	M.

Wash the sore parts well with soap and water, dry carefully, then apply the above.

Dr. H. B. Hodges writes to the *British Medical Journal*, that in hundreds of cases, during a quarter of a century of practice, he never knew the above to fail to cure the disease. He uses no internal medication.

REMOVAL OF THE SMELL OF MUSK.

This, which is so abiding, and to some so disagreeable, may be removed from the hands or utensils by applying a paste formed of pulverized ergot. This property of smut-rye was accidentally discovered by Blitz when preparing a compound of the above ingredients.

The Expression of Grief.

This has recently been a subject of investigation by the eminent Italian physiologist, M. Paolo Mantegazza, who has studied with great care all the contractions which suffering produces in the human face, and endeavored to arrive at an exact distinction of the phenomena of real from those of simulated sorrow. All the forms of dolorous hypocrisy he exposes mercilessly. The following, according to M. Mantegazza, are signs of feigned grief:—1. The expression is nearly always exaggerated relatively to the cause of the grief; 2. The visage is not pale, and the muscular disturbance is intermittent; 3. The skin has its normal heat; 4. There is not harmony in the mimicry of grief, and one sees certain contractions, certain relaxations which are wholly wanting in real grief; 5. The pulse is frequent, in consequence of the exaggerated muscular movement; 6. A surprise, or any object which vividly attracts the attention, suffices to make the tragic mask immediately fall off; 7. Sometimes one succeeds in discovering among the tears, the sobs, and the most heart-rending lamentations, the presence of a chuckle, which expresses, perhaps, the malignant pleasure of practicing a deception; 8. The expression is very eccentric, or is wholly wanting in concentric forms.

Dangers from the Use of Pilocarpine.

Besides its alleged ecbolic properties, Dr. Jenkins, of New York, has called attention to another objection to the hypodermic injection of pilocarpine in any case, and that is the flooding of the lungs by an excessive bronchial secretion.

Dr. T. G. Thomas thinks the objection worthy of serious consideration. He had seen a case of uræmia toward the end of the eighth month of pregnancy, where labor was brought on and the child delivered alive, the mother suffering greatly after the birth of the child and becoming comatose. Jaborandi was tried by the rectum, and resulted in a profuse bronchorrhœa, which was at first attributed to an alteration in the circulation. The fluid was excessive, and the noise produced in respiration resembled the so-called "death rattle."

Influence of Medicinal Agents on the Fœtus.

Dr. Kubassow recently reported to the St. Petersburg Medical Society the results of some experiments which he had performed. In three instances a drachm of chloroform, and in six from a scruple to half a drachm of chloral hydrate, was administered as an enema to the woman in labor, sometimes in a single dose, and at others in several times. They were as follows: 1. Both substances given in medium doses exert a decided effect on the fœtus. 2. Both appear to act in a similar manner. 3. At first a stimulant effect is produced, as shown in the more active movements of the child, and in the increase in force and rapidity of the action of the heart. Later this action becomes less forcible

and slower, and the movements of the child are exerted less readily. 4. The effect is induced rapidly, viz.: in five, or at latest, ten minutes. 5. Chloral acts more rapidly and forcibly than chloroform, even when chloroform narcosis is produced. 6. Chloroform can always be detected in the blood of the funis. 7. After injection of chloral a slight excitement is also produced in the mother, which is followed in two or three hours by a diminution of temperature.

Real and Hysterical Tetanus.

Sometimes it is difficult to distinguish between these conditions. In a case reported in the *American Journal of Medical Science*, of the latter condition, Dr. D. Webster Prentiss states that the points in the case marking it as hysterical were—

1. It was ushered in by noise in the ears, deafness and blindness.

In true tetanus and strychnia poisoning the senses are rendered preternaturally acute.

2. There was unconsciousness during the paroxysms.

This never occurs in tetanus and strychnia poisoning, except as an ante-mortem condition.

3. The eyes were closed during the spasms. The eyes stare widely open in the other diseases.

4. The long uninterrupted sleep at night. In this particular there is a resemblance to chorea. In true tetanus there is no such relief until convalescence. It is noticeable also that no relief followed the administration of chloral until it was given in thirty-grain doses.

Paths of Conduction of the Spinal Cord.

From a number of experiments on rabbits, reported in the *American Journal of Medical Science*, Drs. Ott and Smith draw the following conclusions:—

1. That the motor and sensory fibres in the cervical segment of the spinal cord run exclusively in the lateral columns.

2. That the nerves administering to respiration, vasomotor nerves, and cilio-spinal nerves, also run in the lateral columns.

3. That the posterior columns are concerned in coördination.

4. That irritation of the cervical cord causes coördinated jumping movements.

5. That no sensory fibres pass to the brain in the posterior columns.

These observations merit the attention of physiologists, as they define, strikingly, the paths of conduction.

Correspondence.

The Story of Public Health Legislation.

Ed. Med. and Surg. Reporter:—

In the *American Journal of the Medical Sciences*, for October, 1879, is what purports to be a review of "National Public Health Legislation," prepared by one of the members of the National Board of Health, the object of which is to "give an account" of a "marked change" on the part of Congress in its treatment of the subject of public health. As the reviewer practically omits to "review" any legislation except that which refers to the organization of the Board of which he is a member, and as any such review is incomplete unless the *causes* which led to the enactment of the present law are considered, I propose to supply these omissions, briefly, and to give credit for the "marked change" where it justly belongs:

At the invitation of the Philadelphia Board of Health, "the first American Congress ever convened for Sanitary Reform" met in Philadelphia, May 13th, 1857, and continued in session three days. The call for the Convention was in pursuance of the following resolution of the Philadelphia Board of Health, passed October 29th, 1856:—

Resolved, That a committee of three, with the President, be appointed to correspond with the Boards of Health of New York, Boston, Baltimore and New Orleans, on the propriety of calling a Convention of delegates from the various Boards of Health in the maritime cities of the United States, for the purpose of a conference in relation to the establishment of a uniform system of revised quarantine laws.*

There were present at this Convention: from Boston, thirteen delegates, including the Mayor and eight aldermen; New York, four delegates from the Board of Health; Providence, two delegates; Newark, two delegates; Camden, six delegates; Philadelphia, five delegates from the Board of Health; four from the Board of Trade; five from the College of Physicians; and six from the County Medical Society; Wilmington, Del., nine delegates; Baltimore, ten delegates; Norfolk, two delegates; New Orleans, five from the Board of Health, and two from the Common Council. Dr. Jewell, of Philadelphia, was elected President; Mayor Rice, of Boston, and Dr. Barton, of New Orleans, were elected Vice Presidents; Dr. Edward Hartshorne, of Philadelphia, and Homer Franklin, Esq., made Secretaries. Among the delegates were such well known names as Otis Rich, Henry G. Clark, Geo. Hayward, Jacob Bigelow, Usher Parsons, Edwin M. Snow, D. F. Condie, Henry F. Askew and R. LaRoche.

A convention so constituted could not but command the respect of the country, and even after the lapse of over twenty years its proceedings may be re-read with interest and profit.

* The several State quarantine and health laws then in force are too voluminous to insert here; it is perhaps enough to say that Pennsylvania had a very complete quarantine law for Philadelphia, as early as 1700; the New England States earlier; and that the Boston quarantine was reorganized on very nearly its present basis in 1827; while Congress passed a law, which was approved February 25th, 1799, entitled, "An act respecting quarantines and health laws."

This Convention adopted 23 propositions; of these the first 18 relate to the general principles and details of quarantine management; propositions 19 and 20 read as follows:—

"19. With a view to procure a uniformity in quarantine regulations throughout the several ports of the United States, the assembling of another, and probably several, conventions similar to the present one will be required.

20. To provide for the assembling of such a convention in 1858, it is suggested that the President, Vice Presidents and Secretaries of this Convention, with a committee of one member from each State represented in the Convention, be continued after our adjournment, as commissioners for the purpose of taking the necessary steps for the call of a convention next year; *Provided, however*, that their powers shall cease immediately upon the assembling and organization of the Convention of 1858."

The second National Quarantine and Sanitary Convention was held in Baltimore, April 29th, 30th and 31st, 1858; the third Convention in New York, April 27th, 28th, 29th and 30th, 1859, and the fourth in Boston, in 1860. Space will not permit me to give in detail the proceedings of these conventions, but their bearing on subsequent national legislation is so important that I quote from the proceedings of the New York Convention: "A committee, consisting of Drs. J. W. Francis, F. E. Mather and John Hutchinson, was appointed to consider and report upon the plan of W. A. Royce, for 'compressing and refrigerating the atmosphere, preliminary to its use to disinfect vessels,'" etc. A. H. Stevens, M.D., of New York, submitted the following:—

"*Resolved*, That in the absence of any evidence establishing the conclusion that yellow fever has been conveyed by one person to another, it is the opinion of this Convention that personal quarantine of cases of yellow fever may be safely abolished."

This resolution received eighty-five votes, and only six were cast in the negative; an amendment was adopted, on motion of Dr. A. N. Bell, as follows:—

"*Provided*, That *fomites* of every kind be rigidly restricted."

Several of the maritime cities took action on this report, and the New York Chamber of Commerce having appointed a select committee to consider the subject, adopted seven resolutions, six having reference to the local quarantine, and the last recommending the "establishment by Congress of a system of warehousing in connection with the quarantine station at the port of New York." At this Convention a committee, consisting of Drs. John W. Sterling, Alex. H. Stevens and John McNulty, reported in favor of quarantine hospitals being controlled and operated by the general government, as follows:—

* * * * "As there are, in our opinion, cogent reasons why the United States should possess the control and charge, as well as the appointments, of a quarantine establishment, we will notice the grounds on which this latter part of the resolution was based: 'In the first place, we consider that a quarantine, from its close connection with the U. S. Revenue Department, and the important bearing which it has on commerce (which Congress alone can regulate), and upon travelers soon to be dispersed throughout the Union, useless, unless it be organized almost exclusively as a national institution.'" The committee then quote the Act of February 25th, 1799, relative to warehousing, giving at some length the details of examination of baggage by revenue officers, and give it as their opinion that "the health officers should not be subject to the control of the Municipal Boards of Health." Although not concurred in by the Chamber of Commerce of New York, it may be fairly said to have originated the idea of national control of external hygienic measures. It was further expanded at the Boston Convention, in 1860, where a committee, composed of Drs. Elisha Harris. A. N. Bell, and Wilson Jewell, offered the following resolutions:—

"*Resolved*, That this report (on external hygiene) be referred back to the committee, with directions to negotiate with our national government, or Department of State, to secure, by convention or otherwise, the national and international adoption of this code.

"*Resolved*, That a committee of one from each State represented in this Convention be designated by the delegates of the several States, and appointed by the Chairman of the Convention, with power to confer with the governments of their respective States, for the adoption of this code.

"*Resolved*. That the local sanitary authorities of the several States, and the municipalities in the United States, be furnished with a copy of this report, and that they are hereby respectfully requested to carry into effect all its *specific recommendations*, and the general provisions of the code, without waiting for their general and international adoption."

The "code" alluded to was the "specific measures of quarantine," recommended by the committee. But the subject of quarantine was not all that the Convention had now taken up; Dr. E. M. Snow, of Providence, was appointed a special committee on "a complete and efficient system of registration of births, marriages and deaths, with particular reference to cities, and the necessary connection of the same with sanitary measures." This "code" was freely circulated among sanitarians and municipal authorities, and is to-day the basis upon which the present quarantine regulations of the country are founded.

The breaking out of the civil war turned the attention of sanitarians into another channel, and we find the same men working shoulder to shoulder in the "Sanitary Commission" of that period. Later, when the American Public Health Association was organized, we find many of the same names prominent in the same line of work. The avowed object of this Association was the "advancement of sanitary science and the promotion of organizations and measures for the practical application of public hygiene," and in the opening address of its President (Dr. Stephen Smith, of New York) he said, "*The general government should, within its appropriate sphere, coöperate with State governments.*" "It must be apparent to every one at all conversant with sanitary science and sanitary administration, that the general government has an important duty yet to perform in providing for the general welfare; it must organize on a proper basis a Department devoted to the collection of information in regard to diseases peculiar to localities and their local causes, of the progress, course and prevalence of contagious diseases and epidemics at home and abroad, and the diffusion of such information among health authorities in all parts of the country and among the people at large."

But the idea of national supervision of purely professional matters has always met opposition.

At the same meeting Dr. Vanderpoel, of New York, said a "uniform system of quarantine laws on the Atlantic and Gulf coasts is the first requirement, but by the term 'uniform' he did not mean a system to be inaugurated by the United States Government, but the several States, the same code to be enforced at every station in each jurisdiction, and adopted by each State."

March 11th, 1873, a resolution of the Senate directed the Secretary of the Treasury "to inform the Senate at its next session how many superficial feet of clear space are allotted to each steerage immigrant on board ship, according to official reports of the collectors of customs; also to cause the atmosphere of some of the steerage compartments to be chemically analyzed by a competent expert, with a view of ascertaining its healthfulness; and also to have an examination made of the general treatment of immigrants on board ship, and to suggest such alterations in existing laws as may be necessary to secure effectual protection to steerage passengers."

A commission composed of John M. Woodworth, Supervising Surgeon United States Marine Hospital Service, Dr. B. F. Craig, Mr. J. Fred. Myers, Miss Helen M. Barnard, Mr. C. Colne and Thos. B. Sanders, Esq., reported to the Secretary of the Treasury, upon the above, and the report was transmitted by him to Congress, January 21st, 1874. That body had already passed a law (March 3d, 1855) relative to space for passengers in vessels arriving from foreign ports, provided a penalty for carrying too many passengers, made provision for lockers and hospitals, and regulated the size of the spaces between berths; but upon receipt of the report of this Commission, a law was passed, approved February 27th, 1877, providing for the inspection of passenger vessels by an inspector of customs, who is directed to make a report in writing to the collector of customs whether the requirements of the law are complied with.

September 8th, 1874, the Secretary of the Treasury published a circular (Department No. 90,) defining the "duties of United States officers with reference to quarantine and the public health," basing the same upon section 4792 of the Revised Statutes of the United States, and upon articles 294 and 295 of the General Regulations of the customs and navigation laws of the United States, 1874. Under the same date the Secretary of War issued a general order (No. 109) calling the attention of officers commanding forts and posts upon the sea coast to certain provisions of the same law. Following the above (September 9th, 1874), the late Surgeon General Woodworth issued a circular addressed to the local health authorities and leading sanitarians throughout the country, soliciting such information as would "conduce to the greatest efficiency and harmony of action between State and municipal health authorities on the one hand, and the officers of the national government on the other." During the same year Congress ordered an investigation into the cholera epidemic which had visited our shores. From this time on the subject of public health and national supervision of quarantine received much attention from sanitarians and others, as can be seen by reference to the medical journals and the secular press of the period. The assembling of the International Medical Congress of 1876 gave it further impetus, and the year following a convention of business men and physicians of the Gulf coast and Southern seaboard was called. The Convention met in Jacksonville, Fla., February 14th, 1878, and was composed of 32 delegates; a resolution was adopted to the effect that a *uniform system of quarantine was absolutely required*, and that the *system could only be enforced by the National government*. Based upon the action of this Convention a bill was presented by Hon. Julian Hartridge, of Georgia, in the House, and simultaneously in the Senate, by Hon. Jno. B. Gorden, which bill was passed, and became a law on the 13th of April, 1878.

Lack of space will permit me to give only a brief synopsis of this law: The first section prohibits the entry of any vessel or vehicle (or the conveying of any infected person or persons, or merchandise, or animals) from any foreign port or country where any contagious or infectious diseases exist, into any port of the United States, contrary to the quarantine laws of any State. The second section makes it the duty of the consular officer or other representative of the United States to give information to the Surgeon General of the Marine Hospital Service* of the date of departure and port of destination of any such vessel, and also make the same report to the health officer of the port of destination; they shall also make weekly reports of the sanitary condition of their respective ports; the Surgeon General is charged with the execution of the provisions of this Act (under direction of the Secretary of the Treasury), and shall frame all needful rules and regulations for that purpose, the same to be subject to the approval of the President, but not to conflict with any sanitary or quarantine law or regulation of any State or municipality. The third section makes it the duty of the medical officers of the Marine Hospital Service, and of custom house officers, to aid in enforcing the national quarantine rules and regulations. Section four makes it the duty of the Surgeon General to notify State and municipal and United States officers of threatened ports of destination of such vessels, and requires him to make weekly abstracts of consular sanitary reports and other pertinent information, and transmit the same to health authorities, etc. Section five clothes officers or agents of State or municipal quarantine systems with power to act under this law upon application of such State or municipality; at ports having no quarantine, officers of the Marine Hospital Service are required to perform this duty. Section six repeals all acts, or parts of acts, inconsistent with this Act.

Under the provisions of this act a weekly "Bulletin of the Public Health" was published for nearly a year by the Treasury Department—34 numbers by Surgeon General Woodworth, and 12 by his successor, Surgeon General Hamilton; its publication was transferred, by the act of June 2d. 1879, to the National Board of Health.

The yellow fever epidemic of 1878, the organization of a commission to investigate it (organ-

* This Service, like all Bureaus relating to commerce, is under the Treasury Department.

ized by Dr. J. M. Woodworth and aided by Mrs. Elizabeth Thompson and by the contributions of the whole country), the virtual approval of this effort by Congress, which immediately upon assembling appointed a special committee on Epidemic Diseases, and sent out another commission with experts to make further investigation; the report of that and the former commission, are matters of history which, taken with the law of April 1878, and the action of conventions and sanitarians previously, will doubtless "account" in some measure for the "marked change which has occurred in the situation" of public health matters, and show to whom credit is due for the pioneer work in the direction of public health legislation in the United States. *

News and Miscellany.

The National Board of Health.

We have given in this number, from what will be recognized as a very competent hand, the real history of the origin and development of the National Board of Health. This is a noteworthy contribution, not only because of the momentous character of the national movement it refers to, but further, and just now, because the history of the movement has been recently so inaccurately laid before the profession in one of the prominent medical journals.

Items.

—The Insane Asylum on Blackwell's Island, New York, has been again brought before the public on the charge of cruelty by officers toward the inmates.

—Smallpox is at present hardly known in England. In the month of October there was one week in which not a single case was reported in the 19 largest cities of that country. Almost equal immunity exists in the United States.

—Some time ago we called attention to the disparity which exists in Montreal between Protestants and Catholics in reference to deaths from diphtheria (cur. vol. p. 198). In a late issue the *British Medical Journal* points out the greater prevalence of the disease among Dissenters, compared with members of the Established Church. The subject is a curious one and merits further investigation.

OBITUARY NOTICES.

Prof. James Aitken Meigs, M.D.

This distinguished physiologist, Professor of the Institutes of Medicine and Medical Jurisprudence at Jefferson Medical College, in this city, died November 9th, after a short illness, in the 50th year of his age. The attack commenced with a series of chills, followed by fever, a few days before his death. It was recognized as malarial septicæmia, and he was apparently improving, when he was carried off very suddenly, by embolism.

Dr. Meigs was born in this city, July 31st, 1829. He matriculated in Jefferson Medical College in October of the year 1848, and in March, 1851, graduated with high honors, receiving the certificate annually conferred by the corps of lecturers of the Philadelphia Association for Medical Instruction on those students who passed successfully the examinations upon the lectures delivered by the Association. He then began practice in this city, where he since pursued it until his death. For several years he acted as assistant to the Professor of Physiology in the Pennsylvania College, and engaged in the examination and preparation of students for graduation. In September, 1854, he was appointed Professor of Climatology and Physiology at the Franklin Institute, holding the position for eight years. He was subsequently Librarian of the Academy of Natural Sciences, President of the Philadelphia County Medical Society, and member of many learned societies. As a writer he was eminent in the departments of anthropology and craniology, as well as of physiology proper, and in his earlier years wrote frequently for the medical and scientific periodical press.

His lectures were remarkable for the interesting and pleasing manner in which he conveyed his ideas to his audiences, and were at all times notable for the absence of that dryness which renders lectures of a scientific character distasteful to the average listener. His memory was very retentive, his lectures being always delivered without the aid of notes, and being generally illustrated by plates, etc.

He was unmarried, and leaves no relatives except his aged father.

—Dr. Frank Geisler, of Hoboken, who was found in his office on Monday night, the 3d inst., suffering from the effects of morphine, died later in the night. Dr. Geisler was at one time a surgeon on one of the Bremen steamers.

MARRIAGES.

BRUBAKER—SEEBOLD.—At Hartleton, Pa., by Rev. P. C. Weidemeyer, John Brubaker, of Kansas, son of Dr. Brubaker, of Mifflinburg, Pa., and Jeannette V., youngest daughter of Dr. W. F. Seebold, of Hartleton.

FORBES—BROWNE.—In Brooklyn, L. I., on Thursday, October 23d, by the Rev. S. S. Seward, J. Harrison Forbes, M.D., and Mrs. Sybella Browne, daughter of the late Thomas Thompson.

HULSHIZER—REIGEL.—On the 15th ult., at the home of the bride's parents, by Rev. R. Leighton Gerhart, Dr. Allen H. Hulshizer, of Philadelphia, and Miss Ida Y. Reigel, daughter of Isaac Y. Reigel, of Reigelsville, New Jersey.

ORWIG—SMITH.—On the 21st ult., at the residence of the bride's parents, by the Rev. S. L. Wiest, Dr. Geo. A. Orwig, of Cleveland, Ohio, and Miss Delia F. Smith, of Philadelphia, daughter of Sidney Smith, Esq.

DEATHS.

BOISNOT.—In this city, on the 30th of October, James M. Boisnot, M.D., aged 43 years.

FISH.—On November 4th, at East Pau Pau, Ill., of diphtheria, Eddie, only child of the late S. N. Fish, M.D., a boy of unusual promise, and the pride of his widowed mother.

HILL.—In Sutton, Vt., on Oct. 16th, Dr. S. Hill, aged 88 years.

RODENSTEIN.—At Washington Heights, N. Y., Friday, October 31st, Nellie, only daughter of Dr. L. A. and Sarah Tieman Rodenstein, aged 13 years and 11 months.

HORSFORD'S

Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges.

NEW REMEDIES.

FLUID EXTRACTS.

Coto Bark.—From BOLIVIA. Almost a specific in acute and chronic diarrhœa, cholera, cholera morbus, etc.

Cascara Sagrada.—(Rhamnus Purshiana.) From the PACIFIC SLOPE. A certain remedy for habitual constipation; and very useful in all cases where a laxative or cathartic is indicated. Beware of the fluid extracts of spurious varieties of this bark.

Folia Carobæ.—From BRAZIL. A powerful alterative, which exerts a marked curative action in syphilis, scrofula and kindred disorders.

Rhus Aromatica.—A remedy in diabetes, and other diseases of the genito-urinary organs.

Damiana.—(Turnera Aphrodisiaca.) From MEXICO. The best known aphrodisiac. Of great value in impotence, spermatorrhœa, and loss of sexual appetite.

Boldo.—(Peumus Boldo.) From CHILI. The new tonic. Very useful in dyspepsia, hepatic torpor, yellow fever, etc.

Berberis Aquifolium.—From CALIFORNIA. Has marked alterative and tonic powers, and has been used with extraordinary success in salt rheum, psoriasis, eczema, scrofula and syphilis.

Black Haw.—(Viburnum Prunifolium.) From the UNITED STATES. Employed to prevent abortion and miscarriage.

Grindelia Robusta.—From CALIFORNIA. A valuable curative agent in asthma and diseases of the air passages.

Grindelia Squarrosa.—From CALIFORNIA. Anti-malarial. Used in enlarged spleen and other malarial diseases.

Cereus Bonplandii.—(Cereus Grandiflorus and Cereus McDonaldii.) From MEXICO. Heart sedatives. Very useful in controlling functional and organic disturbances of the heart.

Kaki.—(Diospyros Kaki.) From JAPAN. Peculiar action on the mucous surfaces. Useful in mucous dyspepsia, typhoid fever, etc.

Cercis Canadensis.—Indigenous. A positive remedy in chronic diarrhœa, dysentery, etc.

Jaborandi (diaphoretic). **Guarana** (sick headache). **Fucus Vesiculosus** (anti-fat).
Bearsfoot (enlarged spleen). **Coca** (nervous stimulant). **Kava Kava** (Gonorrhœa).
Eucalyptus Globulus (antiseptic and anti-malarial). **Yerba Santa** (coughs).
Yerba Reuma (catarrh). **Wood Betony** (dyspepsia). **Ustilago Maidis** (oxytocic).
Penthorum Sedoides (catarrh). **Soap Tree Bark** (tooth wash).

CRUDE DRUGS.

Goa Powder (ringworm and diseases of the skin). **Gurjun Balsam** (a substitute for Copaiba).
Alstonia Constricta (a substitute for Calisaya).

SUGAR-COATED GRANULES.

Calcium Sulphide 1-10 gr. (for the cure of boils and carbuncles).

Our limited space prevents our describing in detail the history and application of each remedy, but to those interested in NEW REMEDIES, we will say, that we can furnish interesting information relative to the above new drugs.

PARKE, DAVIS & CO.,

DETROIT, - MICHIGAN.

Our New Remedies can be procured of the Drug Trade throughout the United States. By specifying **"P., D. & Co.'s"** in all cases, you will ensure reliable preparations of the **true drugs.**

W. H. SCHIEFFELIN & CO.'S
SOLUBLE
Pills and Granules.
UNEQUALED FOR
Purity in Composition, Solubility in Coating, Uniformity in Size, Perfection in Form and Finish.

1. The best materials are used in their manufacture.
2. No article required by a formula is omitted on account of its high cost.
3. No Pills are deficient in weight.
4. The Pills are Coated while soft.
5. There is but one Coating, which is perfectly soluble, and there is no sub-coating of resinous character.
6. The Coating is so transparent as to clearly reveal the color of the mass, and its solubility is not impaired by age.

Our list of Pills and Granules embraces those made according to the formulæ of the U. S. Pharmacopœia; also most of those in common use among the profession.

Trade supplied in Philadelphia by

1164-1215eow ROBERT SHOEMAKER & CO.

JOHN C. BAKER & CO.'S

WITH
EXTRACT of MALT,

A combination we have lately added to our list, in response to a demand from physicians of this city, who have used our **Pure Cod Liver Oil** and other preparations. The praise accorded by all who have used it induces us to seek a wider market by calling general attention to it.

A Trial is Respectfully Solicited.

Our facilities for the manufacture of

THE EXTRACT OF MALT

are unsurpassed, and perfect reliance may be placed on the article bearing our label.

Above are in full pint bottles, and with our other specialties:—

Baker's Pure Cod Liver Oil,
" *C. L. O., with Phosphate of Lime,*
" " " " *and Wild Cherry,*
" " " *Hypophosphites of Lime and Soda,*
" " *and Malt with Syr. Iod. Iron,*

Are supplied by the drug trade generally.

An astringent and balsam combined, in most convenient form for application. Rapidly becoming popular with physicians. Descriptive circular and endorsements mailed on request. Boxes of 14 suppositories to physicians, 75 cts., by mail.

JOHN C. BAKER & CO.,
1180-eowtf PHILADELPHIA.

R. & J. BECK,

MANUFACTURING OPTICIANS,
1016 CHESTNUT STREET,
PHILADELPHIA,

Beg to call the attention of physicians and students to the following novelties recently introduced by them:—

Beck's New National Microscope, Monocular,	$ 75.00
Beck's New National Microscope, Binocular,	100.00
Beck's Economic Microscope, Monocular, -	35.00
Beck's Improved Economic Microscope, Monocular,	50.00
Beck's Improved Economic Microscope, Binocular,	80.00
Beck's New Histological and Dissecting Microscope,	25.00
Beck's New Model Dissecting Microscope, -	15.00
Beck's New Volute Turn Table, self-centering for all slides, - - - - - - - -	7.00
Mr. Walmsley's New Freezing Microtome, complete, with Atomizer, - - - - - -	20.00
Beck's New Clinical Thermometers, with indestructible index and ineffaceable scale.	
Dr. Seiler's Section Knife and Carrier, - -	12.00
Dr. Woodward's Diatom Prism, mounted, -	1.50

The above instruments, together with every article used by the microscopist, will be found fully illustrated and described in our catalogue of 144 pages; mailed free to any address.

SALUTLAND—THE IDEAL OF A HEALTHY PEOPLE.

BY BENJ. W. RICHARDSON, M.D., LL.D., F.R.S., ETC.

[At the recent Sanitary Congress, at Croydon, Eng., the eminent President, Dr. B. W. Richardson, delivered an address, of which the following extract, embodying his ideal sanitary principles, is taken from the proof sheets kindly forwarded to this journal by the distinguished author, through the favor of Dr. Laurence Turnbull, of this city, who was present at the Congress. Of the three sections into which the Congress was divided—medical, constructional and meteorological—the well known physiologist, Dr. Carpenter, presided over the first mentioned, and to his enlightened labor much of the success of the meeting is due.

Dr. Richardson begins his address by citing the opinions of Flourens and Owen, that the natural term of man's life is a hundred years, and then proceeds to give an ideal sketch of "Salutland," where the inhabitants live so as to attain this average age:—]

In order to carry out my design, permit me, in imagination, to convey you into a future age. Let the bells be ringing in the fiftieth year of the twenty-first century of the Christian era. Let us, still speaking our mother English tongue, travel by readiest and quickest transit—in an aerial ship, if it pleases you—to a point on the earth's surface lying to the extreme south of that region which Mr. Hepworth Dixon, in one of his prolific and striking works, happily designated as New America. There land with me in an independent commonwealth, to which has long been given the name of Salutisland, or more commonly Salutland. * * * * * *

THE POLITY OF SALUTLAND.

You will presume that, as a beginning of our travels, we shall go at once to the capital of the nation. That is not possible, for there is no capital. There is a beautiful country, three hundred miles long, and in many places two hundred miles broad, inhabited by seven millions of people, and possessing the most beautiful cities; but there is no single city that claims to be called a capital. All cities have an equal right and an equal importance. But where, say we, is the centre, or seat of government? Is there not in that sense a capital? Not at all. There is no seat of government, and yet every city is such a seat. In the early days of the commonwealth, the wise, matured men, who had passed the age of ambition's fool, came to the conclusion that it would be dangerous to concentrate any ruling power in any particular city or centre. * * *

The absence of a seat of government, and of all centres for cabal and plots of politics, does away altogether with professed politicians, a condition which these wise people very much appreciate. They have a singular idea, gathered from what they have learned among political nations, that politics is a sort of quackery. When, therefore, they see one of their community getting up to make violent political speeches, they treat him as a harmless lunatic if they think him sincere and single-minded, and as a dangerous one if they guess that he has any selfish or personal intentions or aspirations in view. The result is that would-be political men are all in the shade. They

are called, after a term gathered from the old country, "Coventryites," and they are so universally recommended to go to the place connected with their name, that they give very little trouble indeed. As to the practice of ruling by parties, and balancing one set of ruling spirits, each equally ambitious to show how they cannot do it, against another, by which some ancient people were at one time hanged, drawn and quartered at regular intervals, they look upon that with absolute wonder, and as almost too incredible to be conceived in connection with the normal existence of reasoning minds. It suggests to them a spectacle of incessant civil war, bloodless but costly, devastating, maddening and mortal. Certain it is, they maintain that with so much political strife it would have been utterly impossible to have attained the length of days, riches and honor of Salutland. * * *

It must not be supposed, however, that there is any disregard to order and public law in our ideal country. There are administrators of order according to the public will, and officers of it. In all communities under a thousand of population there is the magistrate or commonwealth Censor, who adjudicates on appeals made to him on behalf of public justice. The Censor is a man who has reached forty years of life, and in every community it falls in order of age to one man to hold this office for one year, if he be himself of good and worthy repute. Where the community numbers over a thousand, one more Censor for every thousand persons is added, so as to constitute a sufficient tribunal, while in urgent cases it is permissible to summon a larger council from those who have previously held the office of Censor. Thus it falls out, that every man in the State has, of necessity, without election or any caprice of the kind, to expect to perform the highest function connected with local self-government; and as he who will some time be called upon to administer justice must needs be himself pure of heart, the fact of the responsibility that will come on him helps to keep him strong and resolute in virtue. Beneath the Censors are, in like manner, impressed a sufficient number of officers, composed of men over twenty and under forty, who carry out the instructions of the Censors, and bring before them those who are, for the time, under judgment. No man escapes the single year of this duty.

Where there are no politicians nor lawyers, there is little need for armed men. Carrying out to its fullest possible development another cardinal Christian principle, "peace on earth, good will toward men," the Salutlanders maintain that a people which picks no quarrels has none, and, enigmatical or visionary as this may seem, they find it true. To spend money in making vast engines for the destruction of human life is, to their minds, not insanity merely, but the greatest of crimes, excusable only by the direst necessity.

* * * * * * * *

The destroying professions contracted in the strongholds of our model people, it follows that even the healing professions must also be limited. The fact is so. It were not a Salutland, in any true sense of the term, that should demand, as we have it, one professor to a few hundreds of the population, to soothe and heal up the diseases of body and mind. In Salutland there are no healers as distinct or salaried classes. In the first place, there is little necessity for them. In the second place, on the subject of the laws of life and health, and the construction of the house of life, every person, male and female, has a sound education, the study of this subject being primary in all schools and familes. And, in the third place, the principles of moral science are taught with exacting rule. Thus all the men and women can, to a large extent, take care of themselves and theirs. At the same time encouragement is given to an order of men and women who, combining the offices of minister and physician, and cultivating their minds in a highly intellectual degree, are greatly venerated and esteemed. The women so cultivated are ready to give aid and assistance to other women in great pain and peril; and the men are consulted, if the term may be used, in all circumstances of serious danger to health and life of a public or personal kind. But none of these are paid for their services, and indeed to offer a fee would be considered the greatest of insults, the idea being that to pay a man or woman for the divine service of relieving affliction, either of mind or body, is to spoil the divinity of the act altogether, and to bring it down to the lowest level of the lowest humanity.

These administrators may follow, therefore, some other occupation as a means of livelihood; or, they may be what we would call persons of independent means; or, as is common in many towns, they may receive an endowment which has been left to maintain them in their dignified pursuits. They are still called doctors—learned—and they are indeed true physicians, students of nature, faithful ministers both of body and mind. They consider no honorable labor too low that is connected with the collection of knowledge, no labor too hard that is connected with the administration of what is good. * * *

SOCIAL AND DOMESTIC LIFE IN SALUTLAND.

The first thing that strikes us is the number of their fine but moderate-sized cities. Modern Babylons, like London, Pekin or New York, are unknown among them. It is considered that a centre of life containing, in a limited space, more than a hundred thousand people is a danger, is, in truth, for all purposes of health, unmanageable. Death, they hold, is the shadow of birth, and if large communities be admitted, in which people are herded together, the shadow may be calculated with as much accuracy as an eclipse. Five separate dwelling houses to an acre of land, and five persons to a separate dwelling house, is the densest population allowed. The houses, large and small, are all built, with varieties only of artistic design, on arches, which raise them from the ground; the bedrooms are disconnected altogether from the living rooms; gardens are all around, and gardens are on the roofs. In the midst of the towns the eye is struck with the cultivation of fruit trees that prevails. The towns of Salutland might be called, as ancient Norwich once was called, the towns or cities of orchards. Throughout all the country the land is under cultivation of the most perfect kind for cereal produce and fruit and vegetables. Through this cultivation there are interspersed magnificent parks and glades, in which harmless animals of the most beautiful kind are free to wander. Every tamable animal is there, and all animals are objects of singular and lively interest. The rivers and lakes are filled with varied kinds of fish, and every sort of bird that can be collected, retained and naturalized on the land, is also to be seen. But what strikes us as most curious is that this living, magnificent creation is obviously preserved mainly for pleasure, and instruction and beauty. There is no idea of preparing any member of it for slaughter for any purpose, except for decrepitude, accident, or positive necessity. A man, woman, or child, who for wanton pleasure should hunt down or torture one of the inferior creatures would be cast out of society, while the idea of having the dumb creature killed, and hung up in open shops to bleed and be quartered and cooked for human beings to live on, would be treated with as much disgust as we should now treat the practice of the owners of those African shambles for human remains which Professor Huxley, in one of his most charming books, has so faithfully re-copied, to illustrate the history of a past civilization.

Animals are, notwithstanding, still used by our model people. Their fleeces are used for clothing, their milk for food, and many of them are made to work. The elephant works with an intelligence and skill that is almost human, and with a power that is superhuman, so that he is one of the most useful and faithful, and best-beloved of all the lower animals in the land. He is the rival of the horse, which is also much cared for, and is bred in a state of great perfection for bearing the rider, to which duty he is mainly consigned. He is in much request, for all persons in Salutland male and female, are consummate in the saddle; their country, which contains vast and fertile plains, divided by splendid roads, and their atmosphere, which, except during a short periodical rainy season, is mild and dry, being remarkably suitable for horse exercise. * * * * * *

THE PEOPLE OF SALUTLAND.

From the social life of this ideal land we may turn to the people who inhabit it, and who have proved the truth of the anatomical argument as to the natural constant of human life. They are so advanced, in this respect, that by fifty to sixty years of expected life they are better off than we are who live to-day.

As the people pass before us while we move in their midst, we are fain to divide them, after Flourens, into types of five ages. Their first period of life extends to ten years, in which dentition is perfected; the age of infancy. Their second period extends to twenty years, in which the development of the skeleton is completed; age of adolescence. Their third period extends to forty years, in which the increase of the size of the body terminates and the whole organism is completed; age of manhood and womanhood. Their fourth period extends to seventy years, in which the whole of the internal organs are made firm and invigorated; age of maturity. Their last period extends from seventy to a hundred years, and is subdivisible into two parts, one reaching to eighty-five, the first old age; the second from eighty-five to one hundred or beyond it; the ripe old age, or sacred age.

WORK IN SALUTLAND.

In each of these ages the body and mind have their natural work, and rest, and play. The first age is left to be devoted entirely to active physical growth; not a strain or tax is ever put upon it that approaches labor. "To grow is to labor," is one of the mother's maxims. "It is time to begin to earn bread when the teeth can chew it," is another similar homely proverb. So the children grow up, not in idleness, but in directed pleasures, which tend toward the acceptance of work and play as varieties of one and the same pastime. They are allowed from ten to twelve

hours of sleep; they are led into games and exercises which develop the physical and mental powers; and their only lessons are in practical and amusing tastes in languages and in music. Their own native tongue, still English, and even more purely English, as is natural in a concentrated community, than the English of England, which has become more mixed than formerly, is taught in the purest form of accent and style, as a first consideration. After that, other languages are taught, conversationally, from their roots, and all the languages of Indo-European origin are thus early impressed, and easily impressed, on the mind. Music is taught as naturally as language, in fact, as a part of natural language, the notes running with the alphabet, the chords with syllables, the melodies with sentences. Every child can sing. The birds of the forests, the morning stars that in their courses sing together, are not more harmonious than the children of Salutland.

The result in after days is that every adult remembers the child life with pleasure and profit; that life has been based on happiness, and life so based can scarcely ever be mournful.

The second, or developing stage of life, is also little oppressed with work. A young old man or woman in Salutland would be looked upon as a deformity. The home life is exclusively cultivated. To send boys and girls into cloisters and barracks, to commingle in herds, and exchange their own crude ideas and sentiments as current coin, would be esteemed a parental crime, carried out to excuse parental care and parental responsibility. The young of both sexes during this age go to the academies, where they are taught together, a plan which refines the boys and strengthens the girls. The education is never forced. Hard examinations, prizes, rewards for work, all these stimulants would be held as mentally poisonous, mere excitants of local emulation, to the exclusion of the general. "It is honorable to learn," say the Salutlanders; "it is more honorable to be learned; it is most honorable to communicate learning." So it comes to pass that learning is universally appreciated, and that the office of teacher is among the very highest in the social scale. The teacher is called the second parent, and in after days is often referred to by the scholar in that familiar form, so that lineage seems to descend through the schoolmaster or schoolmistress as naturally as through father and mother.

No profession or calling is thought of in the second age, as to be commenced then. The most that is done is in preparation. "The limbs cannot carry till the skeleton is completed," is a maxim of the Saluts applied to this term. "The brain must not toil until its workshop is constructed," is another maxim also applied to the same period of life. In this period marriage is never thought of; it were a proceeding altogether out of fashion. Families in Salutland springing from such union would stand out like mere dolls in the rest of the community, and would be called dollards, or dottrells, stunted in growth, and stinted in life. There are a few families of dottrells remaining who would give anything to change the name that is tacitly applied to them, and who prefer to die out unmarried rather than perpetuate the abnormality they unfortunately represent.

In the third age the business of life commences, and through it and the fourth age is continued, running often into the fifth. It is part of the whole economy of the Saluts that they never dream either of killing themselves or injuring themselves by work on the one hand, or by retirement from work on the other. They reason in this wise: A human being is constructed to perform a certain amount of work. His heart is born to deliver a certain number of beats, say, in one hundred years of natural life, three billions six hundred and fifty millions of beats. He is constituted to develop in the various organs of his body so many trillions of active cells, which make up his molecular organism, and which duly supplied with force derived from without, are capable of performing so much work as they live and die. More force of heart, more development of cells, more life, in short, no man or woman can ever possess, than that with which they are primitively endowed, as far, at all events, as is yet known, and all the free-will in the world cannot change this one fundamental fact. At the same time free-will can do this much, it can use its own as it likes. It can wear out its cell life altogether equally and sedately, and so live the whole allotted time, keeping a good margin; or it can wear out its cell life altogether and rapidly, leaving no margin; or it can wear out the cell life of one particular organ—brain, heart, stomach, liver, kidney—by excessive use and exhaustion of the cells of such organ, and so can kill the whole organization, by the death of one organ, the rest of the organs being still in condition, perchance, for years of activity.

Such being the facts, they continue to argue it is the best policy to let the life run out by the first plan, evenly and sedately. That plan ensures plenty of time for all a man can do. His ambition directed to worthy objects can be most en-

tirely sated by this procedure. He can live to conceive great and useful thoughts and acts, and to bring them to maturity. He can live to recast those thoughts and acts, to compare them with the thoughts and deeds of other men, to leave them perfected and original in the strictest degree, and to hear and realize the faithful opinions of contemporaries, young and old.

These slow steps toward honor and fame sanctify both honor and fame. They give to the good and the great a foretaste of what shall be said of them when they are dead, and they prevent the young and middle-aged from hoping and expecting to be over-praised by contemporaries until the day of their work is drawing to a close and the work itself has been long enough before the world to permit of a judgment being passed upon it. He only can be wise who has ceased to covet the praises of men, is the idea and the practice in Salutland. He only should retire from active work from whom work retires, is another idea and practice so faithfully followed, that every town yields many workers who, like Titian the Great, are doing their full quantity at the centenaries of their births.

By these methods life in Salutland is meted out into its appointed natural time, and as work is honored universally, and idleness only is despised, there is never more work put on any man, or woman, or child born, than that man, woman, or child can bear with the full assurance of length of days. For all necessary purposes, such is the easy and equal distribution of labor, and so comparatively light are the tasks of labor, from three to four hours in the twenty-four are sufficient for everything that needs to be done, by the busiest of the busy, to keep the social machine in perfect order. * * * * * *

HEALTH IN SALUTLAND.

The Salutlanders have already been spoken of so far as beautiful, in shape and feature, happy, and in the keenest enjoyment of life. One reason of their acquired health is that they have mastered the pestilential diseases. An epidemic from pollution of air, of water, of food, is with them impossible. The hereditary tendencies to disease are either lost altogether, or are so nearly eradicated as to be practically removed. The diseases incident to poverty are stamped out by the removal of their cause. The diseases incident to intemperance and luxury are stamped out by the removal of their causes. The diseases incident to occupation are stamped out by the careful and easy expunging of everything that is injurious in occupations. The diseases incident to worry are stamped out by the abolition of maddening, exhausting, and useless strifes and ambitions.

In a word, this people contends only with the natural elements, the heat of the sun, the flash of the lightning, the changes of atmosphere, from the fatal effect of which they rarely suffer; and with the one destroying inevitable power, the gravitation of the earth, which brings old age and death.

Thus, with the fewest accidental exceptions, the men and women attain the sacred age. Their death-rate is normal and constant, at eight in the thousand per year, and death itself painless; final sleep is hardly more than departure to rest when the day of work is done.

Let us now, as a practical study, glance at the simple means by which the results here described have been achieved. We may do this in the most practical way, and may learn by the exercise as much true sanitary knowledge as if the whole line of evidence were in actual demonstration before our intelligence. Any body of men and women setting forth, as I have supposed, could, as I wish to show, easily accomplish and verify my history.

The people, as I suppose them, originated from some three hundred emigrants, who, at the close of the nineteenth century, in a period of great agricultural depression and political strife, left England, their native land, for what was then called the "Light Continent." Reaching the southern border of that continent, and not finding the kind of government and home they expected, they set forth on their own account, crossed over acknowledged territories, and finding beyond them a tract of land hitherto unexplored, full of singular historical memories of a lost race, and truly no man's land, settled there, and founded their dominion. At first they were mainly a Saxon people; but as they progressed, adventurous men and women of Keltic and Jewish bloods soon joined them, introducing the happiest combination as yet known of mixed races fused into one people; races ever retaining their individualities, yet producing a stable and united community.

In a sanitary sense, the start was excellent. The men and women who founded the commonwealth were from the best working blood of the country that gave them forth. If they had not had courage, endurance, fortitude, perseverance, physical strength, and, in one good word, stamina, they would never, in the bloom of life, have left their native shores. They were, moreover, freed from the bondage of intemperance, and were thus delivered from a scourge which, in our own land of

to-day, directly and indirectly, destroys the physical life of one hundred thousand a year, with forty per cent. of the destroyed mental life of the nation. Thus they yielded a splendid foundation for a long-lived people. Then they became mixed in race; and this again favored the development of a future healthy community, admixture being, under favorable circumstances, a steady source of strength, without deterioration of racial qualities.

On the whole, they might be taken as having, at their start, an expected life value of fifty-five years, with a death-rate not exceeding fifteen or sixteen per thousand.

They were also extremely fortunate in respect to climate and land. The soil they occupied was so fertile it supplied all their immediate wants, and as they spread out and enlarged their territory, under the administration of a limited homestead law, they were not induced to enclose themselves round particular centres in densely-packed dwellings. By choice they were soon chiefly engaged in agricultural pursuits, and although by necessity a minority of them became occupied in industrial arts, these also retained some character of the husbandman. If the factory or in-door worker or mechanic had not his fields to till, he cherished his garden, so that throughout Salutland the sentiment of Sir Walter Raleigh, that no man has a house who has not also a garden, was fully appreciated.

To these advantages the settlers in the new land added those of education. The thirty years' work of the English school board system had told marvelously on the intellectual development of the people. Every settler could read well, write well, calculate well, understand the geography of the earth, and hold a sufficient knowledge of natural history and natural science to enable him to apply the gifts of nature to his own peculiar requirements or necessities.

Priceless boon of all, these settlers had become indoctrinated, in their own land, with the elementary truths relating to public health. They had learned the lesson of physiology; they had acquired a certain knowledge of what were and what were not healthy places. Chadwick's estimate of an eight per thousand death-rate as a normal constant, had been proved to them as possible, with such effect, that they had learned to look upon it as almost criminal for a civilized country to possess a town in which this rate was wilfully broken. They had learned the history of the diseases produced by uncleanliness, had become practiced in the useful and innocuous distribution of sewage, and had seen the dangers that arise from pitching dwellings in damp localities, and in building dwellings with materials that absorb and hold water. In accord in spirit with the best information on these points, they carried out the spirit to the letter in their practice, and so began on a new and sound foundation. Ignoring all thought of false economy, destroying by fire all carriers and sources of contagion, and providing for the instant isolation of every case of contagious or infectious disease, they stamped out the communicable diseases wholesale, with a success and readiness which were surprises even to the most sanguine preventionist, and which gained for them ten years of life. * * * *

The philosophical physicians who soon came to the front in Salutland were, as we have already seen, scientific sanitarians, as well as professed healers of the sick. Any man who called himself a physician was held of no repute unless he combined all these characters, and, on the ground that prevention is better than cure, let prevention stand first in his thoughts. If any one remained content to treat the sick and to be concerned merely with the symptoms of disease, and the medicines that would, as it was fancied, cure the sick, he quickly fell into the position of an empiric, and found it difficult to hold a place in the pale of the legitimate followers of Æsculapius. "Give me the management of the food, the fire, and the window of the room of a sick man," said one of the legitimate representatives of this philosophy, and though all the empirics of the commonwealth, with all their nostrums, be called to treat that sick man, I will govern everything they do that is not actually mischievous." Thus the science of medicine, which in its true and honest position is always in the front rank of advancement, was now somewhat changed. The doctors continued to keep a correct history of diseases, of the course of diseases, and of the causes of diseases, but they added an equal knowledge of prevention, particular and general, and valued that knowledge most.

As in this way they became more and more imbued with philosophical principles, they instituted a grand inquiry, which was called by some the great instuaration of medicine. Dismissing all special modes of cure by particular systems or assumed specifics, they determined to know once and forever what diseases would and what diseases would not get well without the aid of medicines of any kind, the general conditions for recovery being rendered as perfect as was possible. They agreed, in common, to test this method for a month; this being found satisfactory, they extended the trial for three months, for a year, and

finally for five years. They then compared the results of those years with the results of the same number of previous years. The revelation was astounding, and practically reduced the system of treating disease by drugs to such a minimum, that the drug trade ceased virtually to exist. The prescribers and sellers even of infinitesimals were themselves forced at last to give up their case, and to admit that their eyes had been made the fools of their other senses.

This discovery of the triumph of preventive art did not satisfy altogether. It left on record the fact that nature never goes out of her path to cure, and that what has been called the *vis medicatrix naturæ*, was as much a myth as any other of the past myths of physic. It left on record, also, that under the happiest apparent external conditions some diseases will run their fatal course as decidedly without medicines as with them.

The diseases which so progressed were, in turn, discovered to be diseases of what we call constitutional type, depending upon heredity. They were four in number: scrofula with its attendant, pulmonary consumption; cancer; specific disease; and insanity. The majority of the physicians, seeing the results I have named, began at once to teach that, as these diseases were obviously diseases of descent, and were maintained by the intermarriages of persons subject to them, there was only one sure and certain mode of removing them, and that was a common-sense rule, that such intermarriages should not be tolerated. Gradually, as this true light dawned on the people, the advice was followed, with the effect, in an incredibly short space of time, of eliminating these last and most potent miseries of mankind. A few of the physicians, more enthusiastic than the rest, continued to follow out means of cure, and so to set heredity itself at defiance. Whether they would have succeeded remains an open question, for they lost their chance of testing their learning. One of them, it would seem, did advance so far as to declare he had discovered a true specific for the worst of the hereditary complaints; but when he was prepared to put his plan into practice, he failed to find, in his own country, the precise case on which to exercise his skill. His brethren thereupon, with much good feeling, provided him with the means to cross over to America to practice his method there. He went, and found abundant opportunities; but reaping, unfortunately, an unmitigated failure, he was soon content to come back to his own people and to admit that prevention is the natural secret of medical success.

By the eradication of the hereditary diseases, the Salutlanders added full ten more years to the expected value of life, with a near prospective of the full hundred years before them, while insanity was reduced to half its former degree in one generation.

The second of the final advancements had relation to food and feeding. The physiologists, dealing with the two questions of digestion and food for digestion, were led to the conclusion that a considerable shortening of life was induced by the excess of work which was put on the digestive organs. They bore in mind a fact I have already mentioned, that many persons die from the wearing out of one particular organ, the rest of the organs being still healthy. Of all organs, they agreed the stomach is most exposed to this danger. It is so much more worked in comparison with other organs, that it must be the first to die, unless the uses to which it is put be wisely directed. They found, on inquiry, that the truth was as they suspected it to be, and that the stomach was distressed both by quantity and quality of food. The result of the research led to quite a social revolution. Following a suggestion thrown out by Flourens, they decided, on anatomical grounds, that man was neither herbivorous nor carnivorous, but a frugivorous, or fruit-eating animal. Next they estimated the precise amount of food and of drink that was necessary to support the reserve and the active life in the varied stages of life. Again, they determined the reduction of food that is required when the reserve life is withdrawn, and when, the active life being left alone, it is the more requisite that no additional surplus of tissue or fluid, fat or water, should encumber the body, that no excess of force should be supplied to the digestive organs to the deprivation of other organs equally important, and that no over-taxation should be cast on the digestive organs themselves. Step by step, they were led hereupon to the introduction of an entire change of food and feeding. Animals were given up as sources of sustenance; fruits became greatly in demand; the bread tree competed with wheat grain; the banana and the grape were called largely into use; the juices of fruits almost entirely superseded water as beverages, while chemistry, coming in always to the assistance of man, easily transmuted many vegetable substances into the most perfectly digestible foods for every variety of age and constitution. Of purely animal substances, milk only, and the products of it, butter and cheese, retained full sway. Of the vegetable kingdom not frugivorous, cereals, pulses, tomatoes, potatoes,

and other fresh vegetables, with the edible fungi, retained their useful place; and in respect to quantity of food and drink, not more than half by weight began to be consumed compared with what had been consumed before. The change thus commenced soon became universal. It modified not in the least the spirit of hospitality, while it refined it immeasurably. To banquet for the sake of mere sensual gratification became an obsolete vulgarity; to eat till the sense of oppression from food was the accepted index of enough, and nothing less, was soon considered worse than vulgar; while the value of abstention to the body at large, by the saving of digestive power and of stomach cell life, added another period to the general life that had already been acquired. * * * * * * *

Communications.

CASE OF FRACTURE OF THE HEAD OF THE HUMERUS, AND DISLOCATION OF SAME INTO THE AXILLA, WITH COMPOUND COMMINUTED FRACTURE OF THE ELBOW JOINT.

BY H. A. SPENCER, M.D.,
Of Erie, Pa.

On April 5th, 1879, Thomas Normington, aged seventy-five years, while in the act of riding in a double wagon, and hanging on to the shafts of a sleigh that he was pulling along behind with him, was, by a sudden start of the horses, in turning a corner, jerked out of the wagon, striking on the frozen ground, upon his right shoulder and elbow; he was at once picked up and brought to my office. I was absent at the time of his arrival, but a messenger was dispatched for me, and within half an hour after the accident I was in the presence of the patient, whose general appearance showed plainly that he had received a very severe injury. After administering to him proper remedies to overcome the shock that the injury naturally produced, I proceeded to make an examination of the case. I found a very severe compound comminuted fracture of the elbow joint; in fact, it was literally smashed. I also found what I at first supposed to be a simple dislocation of the head of the humerus into the axilla, but upon a more thorough examination of the case, I found, to my surprise, that the head of the bone was not only dislocated, but fractured also, and that the ends of the fractured bone were at least two inches apart. I at once called a carriage and had the unfortunate old gentlemen conveyed to his home, which I found to be a very simple, unpretentious one indeed, consisting of one small room, eight by ten, the furniture a poor, dilapidated bed and an old worn out stove, his only companions being a wife so deaf that a clap of thunder could not arouse her, and a few chickens, one of which was, at the time of our arrival, occupying a portion of the bed as a nest. I got my patient on to the bed, and procuring a pillow, placed the injured arm upon it, applied proper lotions, gave him an opiate hypodermically, and left for home.

As this was a new kind of case to me, and not having seen much in the books in regard to dislocation and fracture of the head of the humerus at the same time, I concluded to call in assistance. Accordingly, the next morning I requested my friend, Dr. C. Brandes, of this city, to see my patient with me, which he very kindly did. After examining the case thoroughly, we both agreed as to the nature and extent of the injury, and that, taking all things together—the age of the patient, the extent and severity of the injury, and the impossibility of reducing the dislocated bone—the chances were against our patient recovering, and decided to keep the arm on the pillow, semi-flexed at the elbow, expecting, of course, if he recovered at all, it would be with an anchylosed elbow joint, and an arm that would be nearly or entirely useless. But it seems, as the sequel will show in this case that we do not always know how much the "*vis medicatrix naturæ*" may accomplish, even in a case where the patient has reached his threescore years and ten. I visited the case every day; on the fifth day after the accident occurred the inflammation and swelling were fearful, ecchymosis appearing from the shoulder down to the hand, and the limb really, at this time, had more the appearance of general gangrene, than anything else; there was a great tendency for the broken end of the humerus to slough through the muscles near the shoulder joint, which I only prevented by keeping the limb well elevated on the pillow. I kept my patient under the effects of morphia, which I administered hypodermically, applied soothing and cooling applications to the limb, and let it go along.

After about twenty days the inflammation and swelling began to subside, and the general appearance of the arm looked better, and in eight weeks from the date of the injury I supported the limb in a light dressing, and put it in a sling, and let the old man get up and go about the house. In a few days he went out doors, and soon came to my office. I then gave him direc-

tions to commence motion with it, all he could bear, and from that time until the present the case has gradually improved; and what is more singular than anything else is, that the elbow joint is nearly as good as ever; supination and pronation are good, and in time I think the joint will be nearly perfect. Of course, the greatest difficulty is at the shoulder joint; the head of the humerus lying in the axilla, and the other broken extremity pressing on the muscles of the upper portion of the arm, keeps up more or less irritation; but the patient informs me that it is improving all the time, and that he can lift almost as much with that arm as he can with the other, and that he is able to split wood and do almost any kind of light work.

I find Mr. Normington to be quite an intelligent old gentleman, well preserved; he informs me that he was born in England, was in the British army thirteen years, has always had good health, and thinks he will be able to take care of horses again, which he has always done a good deal, and is extremely fond of.

My reasons for reporting this case are, that I think it is a case that rarely occurs, and as far as I remember very little is said about it in the books; also the extent and severity of the injury, the extreme age of the patient, and the unexpected favorable result of the case.

Hospital Reports.

PHILADELPHIA HOSPITAL.

SERVICE OF DR. WM. PEPPER.

Reported for the Medical and Surgical Reporter, by Wm. N. Morrison, M.D.

Aneurism of the Descending Arch of the Aorta.

I had intended to bring before you, last Wednesday, a colored man in whom I had diagnosed aneurism of the descending part of the aorta, but the man died from hemorrhage before that time. I have here the heart and a portion of the aorta, and we will be able to determine as to the accuracy of the diagnosis.

I will give you the history of the patient. He was a colored man, 37 years old. He had never been very strong, and had never been able to work very hard. Ten years ago had syphilis, and had it again two years ago. He had had ulcerated sore throat, osteocopic pains, etc. He had been in the hospital several times.

On questioning him I found that he had pain in his chest, which began about three years ago. He had pain running around the base of the chest. The pain was most marked near the angle of the scapula, about opposite the fourth, fifth, or sixth dorsal vertebræ. The pain was more marked on the left side. He had pain which ran down the arm, but this was not the pain of true angina. He was troubled with a little palpitation and slight cough. He had slight hemorrhages, the first of which occurred on the 26th of August. He was then admitted to the hospital. Another hemorrhage occurred before I saw him. At the time I saw him he was expectorating a tenacious mucus, specked with little, hard, black clots of blood. On coming to examine his chest carefully, I found it well developed. The expansion on the right side was not as good as that on the left. There was no dullness on percussion on either side of the chest, front or back. On auscultation the respiratory murmur on the right side was much weaker than on the left. There was no bronchial breathing and no râles. We then arrive at the conclusion of phthisis, which would be suggested by the hæmoptysis, cough, breaking down of the health, and pain in the chest, but the physical signs showed that while there was some impediment to the expansion of the right lung, yet we could find no deposit, nor any organic disease of the lung at all. When we examined the place where the pain was most marked, we found it tender to the touch, but there was no prominence, and although I auscultated it with extreme care, I could hear nothing at all abnormal. Having excluded the idea of tubercular phthisis of the right lung, it seemed to me that the only explanation for this impaired expansion and weak respiration in the right lung was that there was some cause of pressure upon the right bronchus. It might be a solid mass, or, more probably, an aneurism of the aorta. He was able to swallow solid food, but he said that there had been difficulty in swallowing, which had passed away. There was no interference with the voice. There was, therefore, no pressure upon the œsophagus or the recurrent laryngeal nerves. When I examined the pulse in both radial arteries, I found on one side strong pulsation and on the other there was none, but further examination showed this to be due to the radial artery taking an unusual course, and passing around the styloid process of the radius to reach the back of the wrist. When I found the pulse it was exactly like the pulse on the other side. The heart was not enlarged materially, and was in its natural position. There was no valvular murmur to be heard; but over the junction of the upper and middle portion of the sternum, when the patient leaned forward, I could feel a very slight, diffused, heaving impulse. By placing my hand over the heart, I could tell that the impulse was not transmitted from the heart. When I placed the stethoscope over this point I could hear a distant bruit. This man's pain caused him to prefer a situation sitting up and leaning forward, and when he slept he slept lying upon his face. This was very significant of some mass in the chest pressing backward. We had, therefore, evidence of pressure upon the right bronchus, evidence of hemorrhage into the air passage, occurring with slight pulsation and distant bruit, not transmitted upward, and I felt pretty sure that we would fine a small aneurism of the descending aorta lying over the vertebræ, and pressing upon the right bronchus. The aneurism was on the point of rupturing when I made this diagnosis, and the man soon after died, from hemorrhage from the mouth. We will now turn to the

specimen and examine it. The heart is not at all enlarged; following the aorta we find no disease in the innominate, left common carotid, or left subclavian. We now come to the point where the aorta turns downward and backward, to apply itself to the left side of the vertebral column, and there we find an aneurism, about three inches in diameter. This was firmly attached to the bodies of the third and fourth dorsal vertebræ, which were eroded at that point. It pressed strongly upon the right bronchial tube. The aneurism opened by tearing through the tissue of the upper lobe of the left lung. This aneurism was situated in such a position as made it most difficult to detect. We could get no prominence behind, no dullness on percussion, no pulsation, and no murmur, because the aneurism was so deeply situated, with the vertebræ and muscles intervening. At the same time, it was so deeply situated in front that it produced no signs there, except a very faint impulse when the man leaned forward, and a very distant murmur, only heard when the attention was strongly fixed.

Usually, aneurism in this situation reveals itself by pressing upon important structures. It does not press upon the laryngeal nerves, because they are too far front. We usually have pressure upon the œsophagus, pressure upon the bronchial tubes, with extreme dyspnœa, with feeble expansion and weak respiratory murmur. Only the last two were present in this case. If we meet with a case where, without any sign of organic disease of the lungs, we have unilateral impairment of expansion, and respiratory murmur associated with prolonged expiration, and in which stridor is also present, there is reason to suspect pressure upon the corresponding bronchus; and then an examination of the circulatory system will usually show whether the tumor is an aneurism or not. In this case the aortic and mitral valves are perfectly healthy.

PENNSYLVANIA HOSPITAL.

SERVICE OF DR. R. J. LEVIS.

REPORTED BY G. F. SOUWERS, M.D.

Phosphornecrosis.

I present a case of the rather rare form of bone disease, called phosphornecrosis, or "the phosphorus disease." It is peculiar to individuals who have been long exposed to the fumes of phosphorus, and was unknown before friction matches became the subject of extensive manufacture. In these factories, only those who are exposed to the reeking fumes of the fused phosphorus are liable to suffer, and it is only after a number of years of such exposure that those engaged in the process of *dipping*, as it is called, begin to present the peculiar manifestations of the disease. Of late years the affection has, happily, become less frequent, on account of the care with which arrangements are made in the factories for carying away the poisonous fumes. The disease would seem to require a constitutional susceptibility, as but comparatively few of those exposed become affected. Many persons continue at the occupation through a working lifetime, with entire immunity; with others there seems to be a peculiar diathesis or tendency to the affection created, which only awaits some local irritating influences, as ordinary caries of a tooth, to awaken a periostitis, which is sure to go on to the death of the subjacent bone. So generally is the phosphorus disease associated, in its incipiency, with one or more carious teeth, that some of the best authorities believe in the local trouble being entirely due to absorption through an exposed tooth-pulp. I have had good opportunities of observing many cases of phosphornecrosis from the match factories of this city and of Wilmington, Delaware, from the early manifestations of the disease to the entire necrosis of the lower and of the upper jaw, and am convinced that the accident of a carious tooth stands in relation to it as but an excitant of periosteal inflammation, which, under systemic influences, goes on to the death of the bone.

Persons who are exposed to the vapor of phosphorus should at once discontinue their occupation when the teeth become tender, with a sense of elongation on coming together, and when pressure on the gums becomes painful. The progress of the disease is slow and insidious, but it so surely goes on to necrosis of more or less of the maxillary bones, that very decided treatment at the onset is essential, and I know of no way of checking its destructive course, but by free and deep incisions into the periosteum of the alveolar portions of the bones affected. I would advise that, in the incipiency of the disease, the carious teeth should be removed, and that thorough periosteal incisions be made, the patient being kept on a full, nutritious and stimulating diet, and taking full doses of the tincture of the chloride of iron and of the sulphate of quinine.

The lower jaw is more frequently affected than the upper, and it is a curious characteristic of the disease, that the periosteum of the lower jaw throws out an ossifying callus, which sometimes forms quite a compensatory bone, that preserves the form of the lower part of the face. In this manner, almost the entire lower jaw may be encased as a sequestrum, and has been bodily removed by operation. Such ossific replacement does not occur in phosphorus disease of the upper jaw.

This man has worked many years in a match factory, and had once suffered from necrosis of the upper jaw on one side, with some loss of structure, but now the malar or cheek bone is affected, and this is the first instance I have seen of phosphornecrosis of that bone.

You will observe that there are two sinuses in the cheek, leading to the malar bone, from which there exudes a poorly organized pus; on passing a probe into these openings I find them to be the mouths of sinuses leading down to the necrosed malar bone; further, that the probe may be passed in at one and out at the other opening. This man, for some weeks, has been placed on the use of tonics and good nourishment, and is in much better condition than when he first presented himself. There is at this stage of the affection but one method of treatment to be pursued, and that is the removal of the whole of the necrosed bone. For this purpose I shall require a knife, bone chisels, gouges, etc. Before commencing the operation I plug the external

auditory meatus with cotton, so that the blood shall not find its way into this passage, and there clotting annoy the patient. I now make an incision, trap-door in form, and connecting the two sinuses, and I am ready for the next step, which is the application of gouges, forceps, etc., for the removal of the diseased bone; on applying these instruments I am enabled to remove all of the malar bone, including the orbital plate. All fragments of bone, debris, etc., are now removed, the bleeding vessels ligated, the edges of the wound approximated, and the carbolized oil dressing applied.

Periscope.

Value of Hyoscyamine in Mental Affections.

Dr. E. Prideaux, in the *Lancet*, recommends this drug, in doses of $\frac{1}{16}$ of a grain thrice daily. He says—

In cases of senile dementia, in the paroxysms of excitement which occur, hyoscyamine exercises a marked benefit, subduing the excitement very quickly; but as the subjects of this disease are nearly always very infirm and feeble, and their arteries almost always in a condition of atheroma and degeneration, it is only in some cases that it is admissible, and any drug tending to produce cerebral hyperæmia should be given with the greatest caution.

In the excitement occurring in the earlier stages of general paralysis it is stated by Dr. Lawson to be also of great service, but I have not had a favorable opportunity of testing it.

In melancholia it produces little effect, and cannot be said to be of any service.

In conclusion, as a summary of the results of the use of hyoscyamine in a considerable number of cases in this hospital, and from the cases reported by others, in regard to its advantages and disadvantages in the treatment of the various diseases of insanity, it appears—

1. That in most cases of mania, or where there exists great excitement of an aggressive and destructive character, or rapidity of movement and speech, the use of the drug is the most effectual and rapid means of exercising that form of restraint which has been termed "chemical restraint."

2. That in cases of acute mania it will produce sleep and quietude when all other drugs have failed, and is one of the most rapid and reliable narcotics we possess.

3. That in the treatment of the epileptic status in epileptic mania it diminishes the number, frequency, and severity of the attacks, especially if its administration be extended over some time.

4. That in delusional insanity, especially the mania of suspicion and other forms of mania where the delusions are varying and changeable, it has a decided action in producing such an altered condition of the cerebral status that a condition which has been termed "physiological mania" results, and this so eclipses the former delusions and hallucinations that they are forgotten and the mind becomes clear; while, if the subjection to the influence of the drug be continued, it ultimately leads, under favorable circumstances, to a permanent condition of quiescence and restoration to a healthy state of mind.

5. That in chronic dementia, associated with destructive tendencies, bad habits, and sleeplessness, the condition of the patient much improves after a continued course of small doses of the drug.

The advantages that have occurred in its use, and which have to be guarded against, are: The dryness of the tongue and pharynx that occurs, especially after a prolonged administration. This has been thought to contra-indicate its use in cases of artificial feeding, but provided the tube be dipped into an oily liquid before passing, I have not found it any inconvenience. The attacks of vomiting that have occurred in some cases, after an administration of some weeks, necessarily lead to a discontinuance of the drug. Vomiting occasionally occurs after one dose, even a small one, and in two cases mentioned by Dr. Lawson hæmatemesis took place. When rapid and sudden action of the drug is feared in feeble cases, it is better to administer it with the food.

Salicylic Acid in the Treatment of Diabetes.

Dr. Schaetzke publishes, in the *Berliner Klin. Wochenschrift* for June 2d, 1879, the history of three cases of diabetes successfully treated by salicylic acid. The first case was that of a lady aged 50, who had for eighteen months been under treatment for chronic gastric catarrh. Her father, sister and husband had died of tuberculosis. When she was seen by the author, he at once suspected diabetes, from the excessive thirst, polyuria, caries of the teeth, etc. The urine was examined, and found to contain sugar; the specific gravity was 1.038. The patient was treated with salicylic acid, 3 grams (45½ grains) being ordered to be taken three times daily, for three days. On the first day, however, she felt giddy and had nausea. On the second day she vomited once; her hearing was affected, and her gait became unsteady. The dose was, therefore, reduced from nine grams daily to three grams. Owing to her intolerance of salicylic acid, Herr Schaetzke sent her to Carlsbad. Upon her arrival there the urine was found to be perfectly free from sugar, and remained thus both during her cure and afterward. The second case was that of a man aged 58, who probably had been suffering from diabetes for the last two years. The urine contained a considerable percentage of sugar. As the patient could not be

prevailed upon to go to Carlsbad, he drank the waters at home, but without much benefit. Herr Schaetzke then again resolved to try the salicylic acid treatment, beginning, as in the first case, with three grams three times a day. The patient also evinced great intolerance of the drug. It was, however, continued for two weeks, in doses of three grams daily during the first week and two grams during the second week, when the sugar disappeared from the urine and did not reappear. The other case was that of a girl, aged 26, who had been suffering from colic for years. She was treated in the same way as the other two patients, but was obliged to discontinue the treatment after the first four days, owing to her intolerance of the drug. A week later another attempt was made with a dose of two grams daily; this was continued for a fortnight, when the urine remained free from sugar. It is curious that in every one of these cases the patient should have been so intolerant of the salicylic acid. Could this phenomenon be in any way connected with their disease? and, if so, in what way? A series of three cases can hardly be regarded as sufficient for establishing the reputation of salicylic acid as a cure for diabetes; but the subject is worthy of being more thoroughly investigated.

Purgatives in the Early Stages of Typhoid.

On this disputed subject in treatment, Dr. E. M. Boddy writes to the *Medical Press and Circular*, October 8th—

In the premonitory stage of typhoid fever we have the usual symptoms indicative of a febrile condition, which we very often see in patients who are suffering from the pernicious effects of prolonged constipation through over eating, inactive habits, and inattention to the bowels. I have noticed this marked similarity of symptoms frequently, and I am sure that some of my patients (when the diarrhœa had commenced, owing to the inability of the intestines to contain their contents) would infallibly have dropped into that condition called typhoid fever, had the administration of calomel not been resorted to.

We find that the premonitory symptoms are chilliness, offensive breath, a dry, furred tongue, loss of appetite and nausea, bowels constipated and irregular, and the urine loaded with phosphates; and there is also a pain in the back. These are the principal symptoms, which are quite sufficient for our purpose, pointing decidedly to bowel disorder, and would be speedily rectified by the administration of such a purgative as calomel. This simple treatment, however, is overlooked, and consequently, the patient gets worse, and by reason of this abnormal condition of the bowels being unattended to, the patient sooner or later, according to the degree of strength he possesses, succumbs, and typhoid fever results, which very likely is ascribed to invisible germs, to milk, or to some infectious excreta, or to something else equally difficult to disprove. However, it is easy to see that the symptoms point to bowel complication, and we shall find further on that they increase in intensity, owing to the fact that the administration of purgatives is entirely neglected. In the first week (for this fever is divided into different stages) there is great nervous depression, the pulse increases in frequency, there is extreme thirst and heat, the patient complains of pain in the head, accompanied with giddiness, and now the diarrhœa commences, and we get the famous typhoid stools; the abdomen feels full, and in some cases tense and painful, and we become aware, on pressing the right iliac region, of a gurgling sensation, which is communicated to the finger.

A Case of Amenorrhœa.

The *Medical Press and Circular* gives the following case from the clinic of Dr. Lyster, of Liverpool:—

C. Q., aged 22, came under notice suffering from great pain over the left eye and temple, loss of appetite and debility.

History.—The catamenia commenced at the age of 13, and were regular till twelve months ago, when they ceased. Every kind of medical treatment was tried, without avail, while the patient was suffering great pain, and becoming thin and anæmic.

On examination per vaginam, the cervix uteri was found thickened, elongated, and very tender to the touch, and from the os uteri was hanging a thick, gelatinous secretion. As a primary measure the cervix was punctured and relieved of a few ounces of blood, and a glycerine pad placed against the os uteri. Relief was obtained, but the pain and discomfort returning, it was thought advisable to dilate the cervix with sea-tangle, and cauterize the interior of the uterus with carbolic acid. Glycerine pads applied to the uterus till the sloughs separated. The pains ceased, the appetite returned, and the patient was discharged from the hospital; but the catamenia not returning, the patient again applied for admission. A galvanic pessary was introduced, which brought on the catamenia in a week; menstruation was again deficient, but the introduction of the galvanic pessary was again sufficient to produce them, and since then the patient has been in good health and menstruates freely.

Salicylic Acid in Infantile Eczema.

Dr. T. Von Genser, of the Foundling Hospital, Vienna, is quoted as follows, in the *American Journal of Obstetrics*:—

The most common skin disease in children is moist and oozing eczema, which appears chiefly on the face and head. Without discussing the question whether it is a local or a constitutional disease, but simply stating that we in Vienna consider Hebra's opinions as the direct guide for treatment. I may say at once that the local means used are by far the most important, if not in all cases the only ones. The great number of local remedies which have been proposed serve only to show that none of them succeed in all cases. Salicylic acid has, perhaps, latest come upon the scene, and has now been used in this institution for two years.

The results of our observations may be shortly stated: Treatment with ointment of salicylic acid is eminently successful in cases of *moist* eczema.

The diseased regions treated by it quickly dry up; the skin, at first deeply reddened, repeatedly scales off, and becomes thereby paler and paler, until it is restored *ad integrum*. We have never seen evil results. Immediately after its application the salve causes more or less burning, and the children cry a little, but this soon ceases. Of course, we must not expect too much from the salve. It does not prevent the formation of new vesicles on the periphery, that is, the extension of the eczema. Some cases are extremely obstinate in yielding to it; can, however, be perfectly cured by it without internal remedies.

The ointment is of less value in the dry, scaly form of eczema (squamosa), which so often occurs in children's faces. Here we have to fall back on the tar.

In intertrigo the ointment has given good results.

We have also used it in cases of dermatitis exfoliativa. In his monograph on this disease, Prof. Ritter states that sometimes the denuded corium is moist and oozing, and sometimes dry. It is in the first form that the salicylic salve has proved of great benefit.

Diseases of the Eustachian Tube.

These diseases are, perhaps, not sufficiently considered. Dr. George P. Field, in the *Medical Press and Circular*, points out that the Eustachian tube forms a connecting link, both anatomically and pathologically, between the throat and tympanum. Its diseases are chiefly limited to its mucous membrane, which may suffer from acute or chronic catarrh, the result of which may be an exudation of glairy, inspissated, or purulent mucus. It may undergo thickenings or contractions throughout its whole length, or at various parts. The causes of its most intense inflammation are certain fevers, namely, scarlatina, variola and diphtheria; less severe acute or subacute inflammations result from catarrh, arising from cold, gouty catarrh, catarrh from irritation of the alimentary canal, or from local hyperæmia, the results of smoking, and perhaps of alcoholic excess. The ulcerations of the Eustachian tube are interesting; they are chiefly such as affect the throat; namely, syphilitic, tubercular, follicular, diphtheritic, and variolous; these are nearly all confined to the region of its mouth in the pharynx; nearer the tympanum ulcerations are chiefly secondary to caries of the temporal bone or epithelial cancer. Polypi have sometimes been met with in the tube.

Reviews and Book Notices.

NOTES ON CURRENT MEDICAL LITERATURE.

——Lunacy Asylum reform is occupying the attention of Dr. E. C. Seguin in the *Archives of Medicine*. A reprint of his trenchant article has appeared. There is plenty of occasion for his strictures, and he will receive the thanks of unbiased men for his efforts.

——Lindsay & Blakiston's Physician's Visiting List, for 1880, has appeared, and will no doubt be welcomed by many who have become accustomed to its arrangement. The publishers steadily maintain its grade of excellent manufacture.

——"The Extirpation of the Ovaries for some of the Disorders of Menstrual Life," is the title of a paper by Dr. William Goodell, extracted from the *Transactions* of the Pennsylvania State Medical Society. It is characterized by his usual clear statement and felicitous illustration.

——An article read before the Massachusetts State Medical Society, by Dr. John H. Gilman, of Lowell, gives the history, pathology and treatment of the disease. It contains nothing new, except, perhaps, some directions for the treatment of the disease by carbolic acid.

——Of the "Health Primers" republished by D. Appleton & Co., New York City, the latest is "The Skin and its Troubles." It begins with chapters on the structure and function of the skin, gives the practical applications of these facts, treats of the effects of poisonous clothing and irritating applications, and closes with a chapter on the hair and its management. It is a very useful manual.

——Dr. C. Henri Leonard, of Detroit, has prepared a third edition of his "Reference and Dose Book." It contains the doses of all the officinal, and of nearly all the non-officinal drugs and preparations of any currency, and a number of brief memoranda, as poisons and antidotes, tests of urine, pronunciation, rules for writing prescriptions, etc. The paper and print are not quite up to the mark; in other respects the little book is very satisfactory.

——In very handsome form, with red rules, and neatly bound in cloth, the Kentucky State Medical Society publish the memorial oration in honor of Dr. Ephraim McDowell," "the father of ovariotomy," by Professor S. D. Gross. It was delivered at Danville, Ky., May 14th, 1879, and is a worthy tribute to one of the leaders of American surgery in a past generation. It contains a handsome steel engraving of Dr. McDowell. For sale by John P. Morton & Co., Louisville.

——The fifth of the "American Health Primers," edited by Dr. W. W. Keen, is "The Throat and the Voice," by Dr. J. Solis Cohen. It will be among the most popular of the series, both on account of the straightforward, unaffected style of the author, and also on account of the interest which so many feel in the culture and preservation of the voice, and in the

class of diseases (croup, diphtheria, sore throat, catarrh, etc.) which is here treated of from a sanitary point of view (Lindsay & Blakiston. Price 50 cents).

——"Consumption, and how to Prevent it," is the promising title of a little book of eighty-nine pages, 12mo, by Dr. Thomas J. Mays (New York, G. P. Putnam's Sons, 1879). His conclusions are, that consumption is "a premature dissipation of the force and matter of the body;" and that its prevention is to be attained "by preserving the organs of digestion, by eating an abundance of nutritious food, by breathing pure air, by living on dry soil, by wearing warm and comfortable clothing, by taking plenty of physical exercise, and by avoiding disease and injurious occupations." True enough, but how many consumptives are in a position to take these measures?

——In a reprint, Dr. J. M. Keller, of Hot Springs, Ark., gives us some facts about this over lauded health resort. Of its use in syphilis, he says—

"The daily assertions and many circular statements that syphilis, under any plan of treatment here, can be cured in four or six weeks, are all false, and have done much to ruin the reputation which the Springs actually deserve. It is useless for any one to come here under any such assurances, expecting to be cured. They will surely be disappointed."

Ten weeks, at least, are required for a cure at all permanent. Chronic rheumatism and neuralgia seem the complaints most certainly benefited.

BOOK NOTICES.

Hygienic and Medical Reports by Medical Officers of the U. S. Navy. Prepared for publication, under the direction of the Surgeon General of the Navy, by Joseph B. Parker, A.M., M.D., Surgeon U. S. N., etc. Washington, 1879.

This bulky volume of 1079 pages presents an amount of information, medical, sanitary, climatological and sociological, to which no sort of justice can be done in the limited space of this notice. It is divided into two parts, the first being a collection of reports of medical officers at different stations; the second a number of papers on special subjects by various members of the naval medical staff. Several are on yellow fever, by Surgeons Woolverton, Tryon, Ayers and Perry, and Medical Inspectors Wilson and Mays. A very thorough paper on leprosy, especially as it appears in the Sandwich Islands, is contributed by Surgeon George W. Woods. Sound views as to the relations of air and moisture to health on shipboard, are in a paper by Medical Inspector Thomas J. Turner. Other topics are: Turkish Hospitals, by Dr. J. C. Wise; Madeira as a Sanitarium, by Dr. A. M. Moore; Vaccination in Japan, by Dr. A. F. Price; Life Saving at Sea, by Dr. C. J. Cleborne; The Navigation of the Amazon Hygienically Considered, by Dr. M. L. Ruth; Medical Topography of the International Exhibition, in 1876, by Dr. Joseph Wilson; on Plague, by Dr. J. C. Wise; a Case of Popliteal Aneurism, by Dr. F. M. Dearborne; a Case of Chorea successfully treated by Cannabis Indica, by Dr. C. A. Siegfried; and others. Quite a number of maps, plans, diagrams, and illustrations are inserted in the work, and its appearance and contents are highly creditable to the members of the naval service.

The National Dispensatory. Containing the Natural History, Chemistry, Pharmacy, Actions and Uses of Medicines. By Alfred Stillé, M.D., LL.D., and John M. Maisch, PHAR.D., etc. Second edition, with numerous additions. Philadelphia, Henry C. Lea, 1879. pp. 1680.

The prompt appearance of the second edition of this work indicates the favor with which it was received by the pharmaceutical and medical public. The principal changes are stated to be the introduction of several drugs under separate headings, and of a large number of drugs, chemicals and pharmaceutical preparations, classified as allied drugs and preparations, under the heading of more important or better known articles. A number of illustrations have also been added, and the indexes enlarged.

The frequent use we have made of this Dispensatory, since its first appearance, has impressed us favorably with its arrangement, which is more convenient than that of the U. S. Dispensatory; with its clinical and pharmaceutical accuracy; and with the general precision of its statements. On the other hand, we have not found it, as a work of reference, so complete and satisfactory as the U. S.; and Dr. Stillé, in his therapeutical articles, is too positive and conservative for our taste. He does not give references with sufficient fullness, and he is guided too much by his own experience, and too little by the general opinion, the *consensus*, of other medical writers. While he errs on the safe side, it seems unnecessary to err at all; there are many questions still open which he speaks of as if they were forever decided.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Half-Yearly Compendium of Med. Science,	2.50
Reporter and Compendium, - - -	7.00
Physician's Daily Pocket Record, - -	1.50
Reporter and Pocket Record, - - -	6.25
Reporter, Comp. and Pocket Record, - -	8.25

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,
115 South Seventh Street,
PHILADELPHIA, PA.

VARIOUS METHODS IN THERAPEUTICS.

It is interesting to watch the tendencies of therapeutics, and observe how from time to time one method acquires popularity and another loses it, almost unconsciously to the professional mind.

Twenty-five years ago, about, the *empirical* method was in the ascendant. Empirical is a bad name, and a method in medicine is like a dog, give it a bad name and it will kill it. Yet it is, in its true and proper sense, the correct word to apply to that method which had three most eminent advocates in three great countries, TROUSSEAU in France, NIEMEYER in Germany, STILLÉ in the United States. These influential teachers all agreed that we must learn the properties of drugs as modifiers of diseased processes by observation at the bedside, by close study and careful generalization of their results when administered to the sick, and that this method takes precedence of, though it does not exclude, the results obtained from pathology and physiology.

This is an ancient, in fact, the most ancient, plan pursued in learning the power of medicaments; and it is safe to say that four-fifths of the drugs which we know to be efficient in disease were discovered and their uses defined by following it.

Nevertheless, it was in large measure displaced by the *physiological* method. This placed in the first line the observation of medicines, not in disease, but in health, and less in man, where there are many difficulties presented, than in the lower animals. The assumption was that as the drug acted in a dog in health, so it would in a man in sickness; and this again was backed by a second assumption, that a given diseased condition requires for its alleviation the artificial production of a special physiological process. These two wide and awkward gaps in the reasoning did not prevent the physiological school from having many admirers, and from claiming that it alone was worthy to be called the "scientific" method of therapeutics. It has made a few valuable additions to the materia medica, but whether they were not mere "lucky hits" rather than anything better, is another question. It certainly is chargeable with inculcating the false notion that the patient study of disease can in a measure be supplanted by experiments in the laboratory.

The third method is the *etiological*. Bacon said: *vere scire est per causas scire;* and the advocates of this method say: *Bene agere est per causas agere.* They seek to divide and subdivide the forms of a given diseased condition with reference to its antecedents, and to direct their remedies in each case separately, as the causative indication calls for. No doubt, in many instances, this is an admirable plan; but it is extremely liable to abuse. There are a vast number of antecedents to a diseased state, and it is impossible to determine which bears a causative relation. Take typhoid fever; the reigning notion is that it is a zymotic disease; hence the etiologist will administer antiseptics; or it may be dependent on glandular disorder, as RICHARDSON teaches; then antiseptics are out of place. Symptoms of dysentery may arise from a variety of antecedents, malarial, epidemic

sympathetic, local, etc.; it is often impossible to tell which; hence the treatment goes wide of the mark, and probably in the long run loses more cases than the old fashioned routine plan, based on general experience. It is limited in its applications to where the cause is strictly defined, and even then this may be of such a nature that the proper drug is not clearly recognizable.

We pass now to a method which has come into favor mainly of very recent years. It is the *symptomatic* method. By this we do not mean the treatment of individual symptoms as they arise, but the division of a disease into a number of forms, each characterized by a group of associated symptoms, and then applying to each of these forms a separate remedial agent or combination. This is what the American Eclectic School of Practitioners call "specific medication." Their alleged specifics are not against a given disease, as is sometimes thought, but against an association of symptoms in a disease, or, if the expression is more correct, against a particular aspect of a disease. This is the teaching of Scudder and King; and it has been boldly and largely introduced into the regular profession by Ringer and Phillips, less so by Bartholow, in their respective works on materia medica. Thus Phillips writes: "Leucorrhœal discharges, attended by pain in the loins, feeling of weariness, depression of spirits, loss of appetite, and derangement of the nervous system, are quickly removed by a steady course of pulsatilla, in five-drop doses, three times a day." Again, "In chronic coryza, where the Schneiderian membrane is of a deeper red than is natural, and when its surface is more or less studded with minute ulcerated patches, with a profuse mucous discharge, varying in color and consistence, from thin, clear and starchy, to thick, greenish and yellow, five drops of tincture of hydrastis three times a day, will quickly set up a healthy action," etc. There is an air of accuracy and painstaking observation about all this, as well as a definiteness, of promise, which is very attractive —and we are inclined to believe, hardly less fallacious. It is too much like reading the *Codex Symptomen* of our Hahnemannian brethren; and the wholesale importation of their crude method of procedure would be a step backward. However, it promises to be the vogue for the present.

Notes and Comments.

Therapeutical Notes.

TREATMENT OF DIPHTHERIA.

Dr. H. McCoy, of Wheeling, reports good success with his treatment of this disease (St. Louis *Medical and Surgical Journal*, October). It is as follows:—

℞. Liquoris ferri subsulphatis,
Glycerinæ, āā partes æquales. M.

Sig.—Mop the throat thoroughly with this, and apply externally a thin slice of fat pork.

℞. Acidi sulphurosi, f. ʒ vj
Syrupi simplicis, f. ℥ ij. M.

Sig.—Give a teaspoonful every hour or two.

In a malignant epidemic he treated thus 36 cases without the loss of one.

ARSENIC IN CONSUMPTION.

In the *Medical Press and Circular*, October 1879, Dr. William A. Pearse says the success of the following combination in many cases of consumption has been so great that he feels it a duty to bring it before the profession:—

℞. Liq. arsen. hydrochlor., ♏lxiv
Quiniæ sulph., gr. viij
Acid. hydrochlor dil., ʒ iij
Syrup. aurant., ℥ j
Infus. chirettæ, ad ʒ viij.

This mixture equals sixteen doses, of which one was taken three times a day, after meals. In many cases ten minims of sea water were added to each dose; in others two grains of sulphate of manganese. The patients were directed to continue the medicine during six weeks, then to allow an interval of a week, and again to resume treatment.

CHLORAL LOCALLY IN THROAT AFFECTIONS.

℞. Chloral hydratis, ʒ j
Glycerinæ, ℥ j. M.

Sig.—Apply locally, with a camel's hair brush.

The above is recommended in sore throat, tonsillitis, diphtheria, etc., by Dr. J. E. Chitwood.

Cheilo-Angioscopy.

By this arrangement of letters is meant the observation of the capillary circulation. Dr. Hüter, of Greifswald, has succeeded in effecting it in the human subject. His apparatus consists of a small fixed platform, which is brought conveniently near to the head of the patient, a

spring clip serving to hold the head in a fixed position. The under lip is then drawn out and forward, and secured on the little platform by means of a padded spring holdfast. A brilliant light being thrown on the upturned mucous surface, the delicate capillary network is evident, even to the naked eye. However, a microscope of low power can be easily adjusted for more accurate examination, and by its aid the most valuable information is obtained concerning the condition of the blood, the relative proportion of red and white corpuscles, rapidity of flow, etc. By slight pressure on the lip it is possible to produce all the phenomena of stasis, and the epithelial cells of the mucous lining of the mouth can be perfectly seen. We can readily agree with the inventor of the cheilo-angioscopic apparatus, that its extensive employment will immensely assist the medical practitioner in attaining a speedy and accurate acquaintance with the most important data to guide him in forming his estimate of a patient's state.

The Immediate as Distinguished from the Permanent Treatment of Disease.

Dr. J. Milner Fothergill recently read an instructive paper on this subject, before the Harveian Society of London. He pointed how in many cases the treatment which gives immediate relief is not that to be continued in the permanent interests of the patient. He instanced first the free use of opium in the hacking cough of phthisis, and in chronic bronchitis, which gave immediate relief, but did harm eventually. Then, in the diarrhœa due to impacted masses in the rectum, astringent mixtures might give immediate relief, but they were not curative, while removal of the masses was. So, too, in neuralgia, the injection of morphia eased the pain for the time, but if continued, was more likely to confirm it than to cure it. Likewise in dyspepsia, of reflex origin; it was all very well to give the ordinary mixture to relieve it, but its cure depended upon the removal of the exciting cause. In gout, too, the application of cold, or of leeches, gives instant relief; but he quoted Garrod in illustration of the evil consequences which follow such treatment. But of all instances of the conflict between the present and the permanent treatment of disease, that furnished by endocarditis was, he said, the most striking. It was the rule to give tonics as soon as possible, and to get the patient up; but, he contended, the proper plan of treatment is to keep the patient flat in bed for some days after all evidence of active mischief has passed away. The growth of connective tissue in the valve curtains, which is lighted up by the inflammatory storm that passes over the endocardium, persists some time after the endocarditis itself is over; and it is the mutilation caused by the contraction of the neoplasm which we have chiefly to dread. Consequently, the true line of practice is to reduce the strain upon the inflamed valve curtains by complete rest, and the administration of agents which lower the blood-pressure within the heart and arteries. The more the connective tissue growth could be limited at the outset, the less the future mutilation of the valves. A few days in bed are nothing, compared to future valvular disease.

Dangers from Turpentine Vapor.

A Parisian correspondent of an English contemporary writes—

The danger of inhaling the vapor of turpentine has been long known, and its pernicious influence on the health is beyond all doubt, as has been verified in several cases occurring in persons sleeping in newly painted rooms, some of which have even proved fatal. Several theories, more or less plausible, have been propounded to explain the prejudicial effects of the inhalation of these vapors; but, whatever be the correct explanation, there is no doubt of the danger of occupying a room recently painted in which turpentine has been employed, before complete desiccation has taken place. It was pointed out by the Council of Hygiene, that a sudden death which recently took place in Paris was attributable to this cause, it being shown that it could not be ascribed to the lead which entered into the composition of the paint of the room in which the deceased slept; the lead, being fixed and non-volatile, cannot in these cases be accused of being the offending element.

Smallpox and Vaccination.

It is astonishing to see, in the New Orleans *Medical and Surgical Journal* for November, a long and leading article from Dr. M. Schuppert, opposing and condemning vaccination, on the same frivolous, partisan and utterly erroneous grounds which have been so often presented by anti-vaccination leagues, and so triumphantly refuted. Dr. Schuppert writes—

"Vaccination, as a protective measure against smallpox, has forfeited its claim to the confidence of every clear-sighted man. Whether it would be, therefore, in the general interest of mankind to abandon its practice totally, altogether, cannot

longer be doubted. The protecting qualities of vaccine are based on error which, under circumstances, may become even fatal."

Fortunately for this people, "the common sense of most," and the just verdict of scientific observation, remain in the ascendancy, and with what result? The answer comes in the National Board of Health *Bulletin*, November 8th, in these words—

"The mortality tables of the *Bulletin* have for many weeks presented the interesting fact that in more than one hundred of the largest cities of the United States, containing an aggregate population of over eight millions, not a death of a citizen from smallpox has been reported. This is one of the diseases that cannot escape detection and correct diagnosis when it proves fatal. The returns may, therefore, be regarded as entirely reliable in regard to this disease in all cities requiring burial permits. A reference to the tables of mortality in foreign cities, compiled from the weekly consular reports, which are now made with great care and accuracy, shows that smallpox is prevailing in various parts of the world, and in certain places with great severity."

Dr. Schuppert calls up the old bogy of vaccinal syphilis, ignoring the fact that bovine virus, now everywhere attainable, entirely does away with this slight risk. We are glad to find him relate that he was dismissed from the office of city Physician for exhibiting an erysipelatous arm as a result of vaccination; and we cannot but wonder at the kind of temperament he must possess to boast of this atrocious piece of deceit.

Correspondence.

Meeting of the Tri-States Medical Society.

Ed. Med. and Surg. Reporter:—

Your correspondent failed to put in an appearance here in time for the first day of the four that the Tri-State Society—Indiana, Illinois and Kentucky—remained in session, but fortunately got here in time to participate in the proceedings of the last three. The sessions were held in one of the finest halls your correspondent ever had occasion to speak in; a hall and room especially excellent in an acoustic sense. The usual preliminaries attended the opening of the Society's deliberations; Dr. Ireland's address came off the first evening, and was a very fine one indeed.

On the morning of the second day it became very evident that the press of material would be unusually great, and so the programme was modified. The various Sections—Surgery, Practice of Medicine, Obstetrics, Gynecology, State Medicine, etc.—sent in their reports, and the roster of papers was added to by volunteer contributions from distinguished visitors present who came from without the territory of the Society.

On this evening a public banquet, by which the physicians were brought in contact with the hospitable people of the city, served its purpose to the satisfaction of all.

Quite a number of physicians and surgeons from a distance arrived the third day, the printed programme setting forth the fact that Professor A. M. Owen would read a paper entitled "Lithotomy *vs.* Lithotrity," designed to review the position assumed by Dr. Reuben A. Vance, in the paper he presented the Society at Springfield, Illinois, a year ago, and which subsequently appeared in the Reporter under the title "The Principles and Practice of Modern Lithotrity, and the Recent Issues by which they are Imperiled," and it being currently reported, on the authority of the Secretary, Dr. G. W. Burton, that Dr. Vance had arranged to be present in time to participate in the discussion, at least, of that one paper.

The train brought great accessions to the number already on hand, and at 10 o'clock Thursday morning the number of physicians assembled in Evans Hall was estimated at between three and four hundred.

We noticed among visitors from abroad, Drs. Mussey and Vance, of Cincinnati, Briggs, of Nashville, Borck, of St. Louis, and Dudley, of Chicago.

The Evansville physicians who had not already read their papers made arrangements to withdraw their contributions in a body, in order that more time might be had for the essays of those who had come from a distance. This arrangement did away with the expected discussion looked upon as certain to follow Dr. Owen's disquisition, and also deprived those present of what would doubtless have been an able presentation of the facts from Dr. Owen's standpoint, for the latter is an able writer and a fluent speaker. It was rumored later in the afternoon that both Owen and Vance had agreed to present their views to the Society at the next meeting, to be held in Louisville, in the fall of 1880. In fact, quite a number of other interesting essays went over in the same way.

Three papers—which your correspondent particularizes because they were from outsiders—were contributed on Thursday, by individuals from a distance.

Dr. Edward Borck, of St. Louis, Missouri, dwelt upon "Ovarian Tumors," in certain of their surgical aspects, and inaugurated a discussion, participated in by Rumbold, Mussey, Jones, Briggs and numerous others.

Dr. Reuben A. Vance, of Cincinnati, read a very short paper on certain points in the preparatory treatment for Lithotrity.

Dr. Briggs, of Nashville, gave a full account of the surgical aspects of intestinal obstructions.

Dr. Gregory, of St. Louis, delivered a public address on Thursday evening, which was justly praised by all his auditors.

The fourth day was a repetition of the preceding ones. In fact, without attempting to particularize further, your correspondent declares that the session as a whole was one of the most enjoyable occasions of the kind he ever partici-

pated in. One feature of the affair was the genial, open-hearted hospitality of the physicians of Evansville, who did all in their power to make their visitors comfortable.

The history of the Tri-State Society proves that an essentially practical and clinical organization can be made a grand success. MEDICUS.

Evansville, Ind., Nov. 8th, 1879.

Fracture of Base of the Skull.

ED. MED. AND SURG. REPORTER:—

The following case is, I think, of sufficient interest to warrant publication:—

John Quirk, aged twenty-nine years, an engineer in the employ of the Troy Whig Publishing Company, on the night of September 22d, while at work on the top of the boiler, in the engine room, fell backward, a distance of twelve feet, striking on the back of his head. I saw him within fifteen minutes after the accident. There was a large scalp wound over the occiput; blood was pouring from both ears. He was very restless, and at times violent, and although only semi-conscious, answered when spoken to loudly. His immediate removal to the Troy Hospital was directed, where, after prescribing a dose of potass. brom., with morph., and cold to the head, I left him until morning. He was then quite comfortable; had been violent at times during the night, and tried to get out of bed. A pale, watery fluid was running from the left ear; there was extravasation of blood over the left mastoid process; about twenty grains of brain matter was taken from the right ear. (Dr. Rousseau, one of the medical staff, kindly examined it microscopically, and reported that there could be no doubt as to the identity of the substance.) Very deaf; semi-conscious; slight squint of the right eye. Had not urinated since brought to the hospital; tried to introduce catheter, but he resisted so violently that chloroform was administered, when a large quantity of high-colored urine was withdrawn. It was not necessary to repeat this procedure thereafter, the urine being passed voluntarily. It was necessary, however, to arouse him for this purpose at regular intervals, though it was with great difficulty that he could be made to understand what was required. His condition did not vary much until the evening of the third day, when he had a severe convulsion, which lasted about thirty minutes. This was the only marked secondary effect noted while he remained in the hospital. His mind gradually cleared up, and on the eighteenth day after the receipt of the injury he left the hospital. He was then almost totally deaf, and complained of a fullness about the head

As to treatment, except the occasional use of brom. potash, and a little morphia, little or nothing was done. He was freely purged when the convulsion occurred.

Remarks.—The brain matter very rarely, indeed, exudes from a fracture of the base of the skull. When present, this symptom is, of course, decisive of the existence of fracture. The usual symptoms are either extravasation of blood or the escape of the subarachnoid fluid, both of which were noted in the case cited. The fracture was probably through the petrous portion of the temporal bone, and involved the posterior fossa as well. C. C. SCHUYLER, M.D.

Troy, N. Y., Nov. 7th, 1879.

Treatment of Dropsy.

ED. MED. AND SURG. REPORTER:—

In reply to some recent inquiries in the REPORTER (page 371, current volume), I would say that, as a diuretic in dropsical cases, generally, the following is, incomparably, the best I have tried during a practice of nearly thirty years:—

℞.	Potassii bromidi,		
	" acetatis,	āā	℥j
	" iodidi,		
	Pulv. potassii chloratis,		
	" " bicarbonatis,	āā	℥iij
	Tr. digitalis purpu.,		f.ʒj
	Alcoholis,		f.ʒij
	Aquæ,		q.s

Shake to saturation.

SIG.—Coch. mag., ter die.

The medicine should be taken before eating, in water, flaxseed or watermelon seed tea. Give the above combination a trial before resorting to elaterium or paracentesis. Once upon a time, and while indulging in a random search for something with which to "hit the nail on the head," I determined to aggregate the forces of the above array. I was most agreeably disappointed, and in every case since the result has been truly pleasing. In no instance has the effusion refused to disappear or to greatly decrease, promptly and rapidly, on first trial, usually in three or four days, and in one case in twenty-four hours. Under some conditions, a longer time will, of course, be demanded. In two cases, perhaps, where it became necessary to recur for a second or third time to the use of the remedy, the effect was not so gratifying.

In conclusion, I will add, that while I do not give the prescription as curative, *per se*, in any considerable number of cases, I hesitate not to express my anxiety to have others test its virtues, believing that it will, as a basilar factor, be found most satisfactorily potential.

Camilla, Ga. W. W. TWITTY, M.D.

Manipulation in Reduction of Dislocation.

ED. MED. AND SURG. REPORTER:—

I have, within a few days, encountered in my practice two cases of dislocation, one a luxation of the femur at the hip joint, and the other a luxation of the humerus at the shoulder. My object in reporting the cases is on account of the employment of manipulative procedure adopted in both instances, and the facility of reduction attendant upon such procedure.

The case of femur dislocation happened in a man of about fifty years of age, and of herculean frame. The accident was caused by his being precipitated to the ground violently, from a wagon in which he was riding, the horse attached there-

to having taken fright. Two days intervened before I was summoned to see the patient. On visiting him, I found the thigh semiflexed upon the body, and in a fixed position. Examination of the limb convinced me that the injury I was invited to treat was a displacement of the femur; in other words, luxation of its head backward and upward upon the dorsum of the ilium. Before an attempt at righting the malposition, I proceeded to put the patient under the influence of an anæsthetic. Having accomplished this, I resorted to Ried's method of reduction, which resort was not only successful, but easily and speedily so, and I might add, *felicitously* successful beyond any expectation I had previously ever entertained in the matter of thigh reduction by any conceived or attempted method of procedure or practice.

The second case of accident occurred to a young man aged about twenty-five years, of average muscular development. It was sustained by a misstep, and consequent fall, in alighting from a railway car. The patient called upon me at my office, for consultation, soon after receipt of his injury. Having seated him in a chair, and upon examination satisfying myself of the existence of a luxation of the humerus in the axilla, I proceeded to reduce the same by the adoption of Prof. Henry H. Smith's plan, namely, by the elevation of the arm and rotation of the head of the humerus. I will observe that the same signally satisfactory result crowned my effort at reduction in the last as in the previously mentioned case.

For a description of Ried's method of reduction of femur dislocation the reader is referred to a communication, by Dr. Geo. Sutton, in the Reporter of January 22d, 1875. The article in question is additionally interesting on account of the suggestion of the fulcrum in aid of manipulative procedure. For description and illustration of Prof. Smith's method of humerus reduction, the writer refers the reader to the number of the Reporter bearing date of February 9th, 1861. J. H. Thompson, M.D.

Goshen, N. Y., Nov. 5th, 1879.

Public Health Legislation.

Ed. Med. and Surg. Reporter:—

In giving the "Story of Public Health Legislation," I accidentally omitted the following items, which I deem of sufficient importance in that connection to beg your publication of the same:—

A joint resolution of Congress, approved June 6th, 1872, directed the Secretary of War to detail one or more medical officers of the army to visit certain ports on the Southern and Gulf coasts, with reference to the establishment of a more uniform and effective system of quarantine," and "whether any system of quarantine is likely to be effective in preventing invasions of yellow fever, and if so, what system will least interfere with the interest of commerce at said ports."

Assistant Surgeon Harvey E. Brown was detailed to make the investigations called for, and accomplished the task with credit. His conclusions were, that the "germinal principle of the disease was imported from elsewhere;" that a "system of quarantine can be organized which will prove effective;" that such a system, "properly organized, will not interfere with the interests of commerce;" that the lack of uniformity in State and municipal quarantines renders them inefficient; and that the danger from the disease is measurably lessened in proportion as attention is paid to the local hygiene and sanitary condition of certain ports."

Two years later Senator Sargent introduced a bill (S. 424) to establish a "Bureau of Health," which was twice read, and referred to the Committee on Education and Labor, and ordered to be printed.

The object of this bill was for the Bureau of Health to acquire and diffuse among the people of the United States useful information on subjects connected with the preservation of the public health, and to assist, whenever called upon, the several States and Territories of the United States in the establishment of any efficient sanitary and quarantine systems and regulations. *

Notes from Practice.

Ed. Med. and Surg. Reporter:—

The following notes may be useful to practitioners:—

1. A drop of glycerine allowed to fall into the hypodermic syringe will keep the piston moist for an indefinite time, and prevent the annoying delay which the physician is apt to experience when he wishes to use his hypodermic syringe after a few days' rest.

2. The tin bellows which is manufactured for the purpose of blowing the poison into the holes where roaches may be lurking, forms a more convenient, and surely safer, method of applying sulphur locally to the throat in diphtheria than a quill, as has been recommended.

3. Many physicians wish to preserve permanently the tracings made on the glass by the sphygmograph. The following method is, I believe, original:—

Make a strong solution of the ferrocyanide of potassium (the *red, not yellow*, prussiate of potash). Paint this solution over some sheets of writing paper, allow the paper to dry in the dark, and keep them secluded from the light. When it is required to make a copy of the tracings, cut a piece of the paper of an appropriate size, and having laid the glass upon it, face downward, expose it for some hours to the sunlight. Then remove the paper and wash it in clean water. The sphygmographic curve will be found permanently printed in blue. Daniel I. Kelly, M.D.

Washington, D. C.

A Nuisance.

It is a nuisance and an imposition on readers of periodicals, medical or general, to have advertising leaves sprinkled through the reading matter. A few years ago this was unknown in any respectable journal; but of late it has been introduced and is extending. We advise readers to protest in energetic terms to the editors against it.

News and Miscellany.

The Diphtheria in Russia.

A dispatch to the London *Times* says: Diphtheria, which for several years has made great ravages in Russia, seems now to be gaining more and more ground. The disease, says the *Novoe Vremya*, has attained such frightful proportions in some regions that the percentage of mortality far exceeds that of the births. In Odessa, since May last, diphtheria snatched away seventy-six per cent. of the children, and in Stavropol, in the course of four months, one-half of the infant population fell victims to the disease. More than eleven vast districts are afflicted with the disease. The mortality, both of the youthful and adult population, is so enormous that the government has appointed a special commission, under M. Karel, Physician in Ordinary to the Emperor, to inquire into the causes of the epidemic, and has issued strict injunctions to the local authorities about the measures to be adopted for the arrest and extinction of the disease.

Definition of Evolution.

The *Chemist and Druggist* observes that it was Herbert Spencer who made the following definition of evolution: "Evolution is a change from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity, through continuous differentiations and integrations." And it was the mathematician Kirkman who translated the definition into plain English: "Evolution is a change from a nohowish, untalkaboutable, all-alikeness, to a somehowish, and in-general-talk-aboutable, not-at-all-alikeness, by continuous somethingelseifications and sticktogetherations."

Personal.

—The Trustees of the Jefferson College, at the suggestion of the Faculty of the College, at a meeting on November 12th, elected Dr. Henry C. Chapman to fill the Chair of Physiology during the present session, made vacant by the death of Professor J. Aitken Meigs.

Items.

Correction.—In the clinic of Prof. Gross, last week, the word *sebaceous* occurs for *fibroid*, and *myxoma* for cystic growth.

—Dr. G. E. Rindfleisch has calculated the rapidity of the reparation of the blood after the menstrual loss, and finds it to be at the rate of 175 *millions* of red globules per minute!

—The wife of Li-hung Chang, of Shanghai, having fallen ill, and all the native doctors having pronounced her case hopeless, an English practitioner was called in, and cured her. As an expression of his satisfaction at this result, Li-hung Chang has established a hospital at Tientsin, under foreign guidance, which is being largely patronized by the higher class of Chinese.

—Dr. Spörer, of St. Petersburg, claims an important improvement on Nélaton's reversal method in chloroform asphyxia. Instead of merely holding the patient head down, he hangs him or her out of a window, head down, swinging the body to and fro like a pendulum, thus getting fresh air, etc. There is nothing like improving on the methods of the elders.

—The St. Louis *Clinical Record* says—

"The older medical schools of this city are crowded with students. 'Hard times' are evidently giving way. The prospect of more stringent requirements in the near future is evidently having its effect also in driving the more timid to school while diplomas can still be easily obtained."

—The New York *Nation* says: All health boards may be advised to take notice of the inquiry into the cause of the foul water universally complained of in the Red River region of Minnesota, as well as further south and west, as set forth in the seventh annual report of the State Geologist (Minneapolis). Alkaline waters and pine well-curbing are the two factors which have produced an endless amount of typhoid fever.

—A literary wit of scientific tendencies is rather hard upon Professor Tyndall, and thinks that the Dean of Westminster, when he married him, a short time since, missed his opportunity. He is of opinion that when the Dean put the familiar query in the marriage service, it should have run thus: Do you take this anthropoid to be your co-ordinate, to love with your nerve centres, to cherish with your whole cellular tissue, until a final molecular disturbance shall resolve its organism into its primitive atoms? The learned professor would probably have thought twice before answering, I will!

OBITUARY NOTICES.

Prof. James Aitken Meigs, M.D.

At a meeting of the Faculty of Jefferson Medical College held November 10th, the Dean announced the death of Dr. James Aitken Meigs, Professor of the Institutes of Medicine. Whereupon it was

Resolved, That the Faculty of Jefferson Medical College have learned with profound sorrow of the death of their friend and colleague, Dr. James Aitken Meigs, which occurred on the morning of the 9th inst.

The Faculty desire to express their keen sense of the great loss they have sustained. While bowing to the decree of an all-wise Providence they deeply mourn the removal—in the prime of life—of their beloved friend and associate.

Gifted with superior powers of mind, cultivated and matured by a life of study and research, and genial and kindly in his bearing, he won the admiration and confidence of all with whom he associated.

His clear and impressive manner in the lecture room secured the attention and sympathy of his pupils, and rendered him eminently successful as the expounder of an extensive and difficult branch of medical science.

At all times cordially in sympathy with his colleagues, and loyal to the interests of the school at large, the Faculty feel that while they have lost a judicious and helpful companion, the Jefferson Medical College, for whose success he labored so faithfully, has been deprived of both an ornament and pillar of strength.

Resolved, That realizing the unutterable sadness thus brought upon the venerable father of Dr. Meigs, the Faculty desire to convey to him their sincerest sympathy and confidence.

Resolved, That a copy of these resolutions be transmitted to the bereaved father, and that the Faculty will attend the funeral in a body.

ELLERSLIE WALLACE,
Dean of the Faculty.

JEFFERSON MEDICAL COLLEGE,
November 11th, 1879.

A special meeting of the Alumni Association was held this morning, at the College, at 11 o'clock, to take action in reference to the death of the late Professor J. Aitken Meigs. There was a large attendance of the members of the Alumni and the students of the College. The President, Prof. S. D. Gross, presided, with Dr. T. H. Andrews as Secretary.

Prof. Gross, in alluding to the death of Prof. Meigs, said—

"He was one whom we all loved, whom we all admired, and whose loss we all feel. It is fitting that we should take some action as a tribute of respect to his memory. His loss to the College and the American medical profession will be deeply felt. I knew him for many years, and I always found him a true man, amiable and considerate in all his affairs, able and learned as a professor, and highly instructive and considerate as a colleague."

Prof. Gross then presented a minute, which was adopted.

"The Alumni Association of the Jefferson Medical College of Philadelphia has heard with profound sorrow of the death of Prof. J. Aitken Meigs, which took place at his late residence, in this city, on Sunday, November 9th, in the fifty-first year of his age. By this event, so sudden and unexpected, the Association has lost a most valued member, the College a most able, eloquent, successful teacher, and the American medical profession one of its brightest ornaments. The Association, in making this record of its sorrow, tenders to the aged and afflicted father of Dr. Meigs its heartfelt sympathy, and orders that a copy of these proceedings be sent for publication to the daily papers and to the medical journals of this city. Drs. William B. Atkinson and Turnbull made brief remarks relative to Dr. Meigs. Dr. Turnbull offered the following tribute, which was ordered to be placed on the minutes."

"WHEREAS, We have learned, with heartfelt sorrow and deep regret, of the sudden and most unexpected death of our dear and much beloved associate, James Aitken Meigs, M.D.,

Resolved, That while it is our painful duty to bow submissively to the mysterious and all-wise dispensation of God, we most sincerely mourn and deplore the early death of Dr. Meigs, in the very prime of his years and in the midst of his philanthropic and scientific labors.

Resolved, That it is with both pride and pleasure that we can look back to his character as a physician, his admirable powers as a lecturer and experimenter, and above all, to the noble example he set the members of our profession in his life of temperance and chastity.

Resolved, We shall hold in bright remembrance his genial, loving and social qualities, his wisdom, true Christian nobility of soul, and tried professional integrity.

Resolved, That our earnest and warmest sympathy is here expressed and extended to his sorrowing and truly bereaved parent, whose last earthly prop and stay has been thus suddenly removed, and we devoutly pray that he may be sustained in his great trial by the tender care and helping hand of the Great Physician of souls, who is always ready to succor the sorrowing and heal the broken hearted."

On motion the Association adjourned.

Dr. John Jay Abernethy,

Medical Director, United States Navy, died in New York, October 28th. He was born in Connecticut, December, 1805, graduated at Yale College, 1825, and took his medical degree in New York city. In 1837 he entered the naval service of the United States as a surgeon, and rose, by regular promotion, to the position of Medical Director, from which he was retired about nine years ago. One of his first cruises was on the coast of Africa, and subsequently he was with the United States Squadron of the Mediterranean. His first perilous service was seen during the Florida war, and during the war with Mexico he was with the squadron that co-operated with Gen. Scott in his memorable campaign from Vera Cruz to the City of Mexico. During the rebellion, Dr. Abernethy was with the blockading squadron off the Carolina coast. He was at one time Surgeon of the North Carolina, at another in the recruiting service at New London. He was a man of wealth.

D. H. Spickler, M.D.

Died, in Ashton, Illinois, on Tuesday, October 28th of heart disease, D. H. Spickler, M.D., aged forty-nine years. He arose from his bed in the morning, in apparently good health, and went to his office, where he was found dead, about ten o'clock. Dr. Spickler was born in Middleburg, Franklin Co., Pa., March 18th 1830, and went west some time during the year 1853. He graduated in his profession at the Rush Medical College, in 1857, soon after which he entered into partnership with his cousin, Dr. G. W. Hewitt, of Franklin Grove. The partnership was eminently successful for a number of years, when the Doctor retired and engaged in the drug trade, which he conducted for a time, and then returned to practice in Ashton, Illinois.

QUERIES AND REPLIES.

Dr. J. N. B., of Pa., asks: "Can a rape be committed upon a female when under the influence of any anæsthetic, and conception take place, without her knowing it, or being at all conscious of the act?"

Ans.—Yes, it can.

Dr. J. S. L., of Ky.—Medical officers in the French army do not hold military rank.

Scrutiny.—It is not considered decorous for a physician to allow his name to be attached to a pharmaceutical preparation.

Wanderer.—We suppose Denver is quite as full of doctors as any other city; and conversely, that a good one runs as fair a chance there as elsewhere.

MARRIAGES.

DUNCAN—MIDDLEKAUFF.—On November 4th, 1879, at "Aborn House," Des Moines, Iowa, J. K. L. Duncan, M.D., and Miss Lillian J. Middlekauff, of Waukee, Iowa, Rev. J. C. Read officiating.

MILLIKEN—DOLLOFF.—In Dixmont, Ct., at the residence of the bride's father, Oct. 22d, by Rev. A. Battles, Dr. Charles J. Milliken, of Cherryfield, and Miss Lizzie M. Dolloff, of Dixmont.

RICHARDS—VAN LIEW.—At the First Presbyterian Church, Bloomfield, N. J., on Wednesday, October 29th, 1879, by the Rev. H. W. Ballantine, assisted by the Rev. Dr. Kennedy, Harry E. Richards, M.D., and Helen L. Van Liew, both of Bloomfield.

STONE—REED.—At the residence of the bride's mother, in Bristol Center, N. Y., October 22d, 1879, by Rev. G. S. Watson, J. Leslie Stone, M.D., of Alba, Pa., and Miss Ellen Reed, of Bristol Center, N. Y.

DEATHS.

BROWNLEE.—Dr. James J. Brownlee, who had been for several years an inmate of St. Luke's Home for the Aged, in Hudson, died there, recently, from pneumonia. The Doctor was seventy years of age. He was a native of Pennsylvania, but had been a practicing physician in New York for nearly thirty years.

CALDWELL.—Suddenly, of paralysis of the heart, at Grand Falls, New Brunswick, on the 3d instant, Dr. Charles E. Caldwell, in the 32d year of his age.

MUNGER.—In Waterville, N. Y., on Tuesday, 4th inst., L. A. Munger, M.D., aged 66 years.

HORSFORD'S
Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges

MANUFACTURED BY THE

RUMFORD CHEMICAL WORKS,

1155-1206 PROVIDENCE, R. I.

DE DUDLEY'S EMULSION DE
OF PURE
NORWEGIAN COD LIVER OIL
PANCREATINE
AND
DE LACTO-PHOSPHATE OF LIME DE

FORMULA.—Each fl. oz. contains six grs. of Pancreatine, sixteen grs. of Lacto-Phosphate of Lime, twenty-five per cent. of Glycerine, and **fifty** per cent. of Norwegian Cod-liver Oil.

THE ONLY PANCREATIC EMULSION MADE IN THE UNITED STATES.

This preparation is respectfully submitted to physicians as being **always** reliable. Although well aware that Cod-liver Oil Emulsions have fallen into deserved disrepute, yet we are confident this will stand any test or trial it may be subjected to. It contains no GUM ARABIC, TRAGACANTH, ALBUMEN, SACCHARINE OR ALKALINE MATTER; therefore, it will not SAPONIFY, FERMENT nor RANCIDIFY. The addition of **Pancreatine** insures rapid and complete assimilation, enabling patients with very weak stomachs to easily retain and digest it.

Guaranteed to keep in any climate. Physicians supplied with samples (express paid) on application.

DUDLEY & CO., Pharmaceutical Chemists,

Laboratory, 397 and 399 Pearl Street. **423 Fulton Street, Brooklyn, N. Y.**

MESSRS. DUDLEY & CO.: *Dear Sirs*—Though your EMULSION has not been before the profession a long time still I have used it quite extensively in my practice, and can truly say I think it one of the most elegant preparations of Cod-liver Oil I have ever prescribed. I find it can be readily taken and borne by the most delicate stomach, and the PANCREATINE and PHOSPHATES make its administration desirable in a large number of cases other than phthisical. In fact, there are few cases of mal-assimilation and general debility in which its administration will not do good; and it gives me pleasure to recommend it to my professional brethren.

1179- HOMER L. BARTLETT, M.D., Brooklyn, N. Y., Consulting Surgeon Kings County Hospital.

NEW REMEDIES.

FLUID EXTRACTS.

Coto Bark.—From BOLIVIA. Almost a specific in acute and chronic diarrhœa, cholera, cholera morbus, etc.

Cascara Sagrada.—(Rhamnus Purshiana.) From the PACIFIC SLOPE. A certain remedy for habitual constipation; and very useful in all cases where a laxative or cathartic is indicated. Beware of the fluid extracts of spurious varieties of this bark.

Folia Carobæ.—From BRAZIL. A powerful alterative, which exerts a marked curative action in syphilis, scrofula and kindred disorders.

Rhus Aromatica.—A remedy in diabetes, and other diseases of the genito-urinary organs.

Damiana.—(Turnera Aphrodisiaca.) From MEXICO. The best known aphrodisiac. Of great value in impotence, spermatorrhœa, and loss of sexual appetite.

Boldo.—(Peumus Boldo.) From CHILI. The new tonic. Very useful in dyspepsia, hepatic torpor, yellow fever, etc.

Berberis Aquifolium.—From CALIFORNIA. Has marked alterative and tonic powers, and has been used with extraordinary success in salt rheum, psoriasis, eczema, scrofula and syphilis.

Black Haw.—(Viburnum Prunifolium.) From the UNITED STATES. Employed to prevent abortion and miscarriage.

Grindelia Robusta.—From CALIFORNIA. A valuable curative agent in asthma and diseases of the air passages.

Grindelia Squarrosa.—From CALIFORNIA. Anti-malarial. Used in enlarged spleen and other malarial diseases.

Cereus Bonplandii.—(Cereus Grandiflorus and Cereus McDonaldii.) From MEXICO. Heart sedatives. Very useful in controlling functional and organic disturbances of the heart.

Kaki.—(Diospyros Kaki.) From JAPAN. Peculiar action on the mucous surfaces. Useful in mucous dyspepsia, typhoid fever, etc.

Cercis Canadensis.—Indigenous. A positive remedy in chronic diarrhœa, dysentery, etc.

Jaborandi (diaphoretic). **Guarana** (sick headache). **Fucus Vesiculosus** (anti-fat).
Bearsfoot (enlarged spleen). **Coca** (nervous stimulant). **Kava Kava** (Gonorrhœa).
Eucalyptus Globulus (antiseptic and anti-malarial). **Yerba Santa** (coughs).
Yerba Reuma (catarrh). **Wood Betony** (dyspepsia). **Ustilago Maidis** (oxytocic).
Penthorum Sedoides (catarrh). **Soap Tree Bark** (tooth wash).

CRUDE DRUGS.

Goa Powder (ringworm and diseases of the skin). **Gurjun Balsam** (a substitute for Copaiba).
Alstonia Constricta (a substitute for Calisaya).

SUGAR-COATED GRANULES.

Calcium Sulphide 1-10 gr. (for the cure of boils and carbuncles).

Our limited space prevents our describing in detail the history and application of each remedy, but to those interested in NEW REMEDIES, we will say, that we can furnish interesting information relative to the above new drugs.

PARKE, DAVIS & CO.,

DETROIT, - MICHIGAN.

Our New Remedies can be procured of the Drug Trade throughout the United States. By specifying "**P., D. & Co.'s**" in all cases, you will ensure reliable preparations of the **true drugs.**

OPERATIVE SURGERY.
A MANUAL OF THE PRINCIPLES AND THE PRACTICE OF OPERATIVE SURGERY. By STEPHEN SMITH, A.M., M.D., Surgeon to Bellevue and St. Vincent Hospitals, New York. Fully Illustrated. One volume, crown, 8vo, 697 pages, cloth, $4.00; roan, $4.50.

This volume is a handy book for the practitioner, and by means of a full index is adapted, for instant reference, to all the details of operations.

Though of great value to all professional surgeons, the book is peculiarly useful for physicians who rarely have surgical cases, and who will find the explicit directions and illustrative cuts in this work instantly helpful in emergencies and specially difficult cases.

Illustrations form a very important feature. These have been prepared with special care, for the purpose of rendering the text clear, and of presenting distinctly to the eye the more obscure points of surgical operations.

"I believe I am perfectly familiar with the literature of surgery, and if there is any work of the kind equal to yours, in any language, I am not acquainted with it. This is saying a great deal, but only what is strictly true.—PROF. S. D. GROSS, *Professor of Surgery in Jefferson Medical College, Philadelphia, Pa.*

"The plan of the book is entirely new, and it has been carried out with a completeness which leaves nothing to be desired. Like everything which comes from Dr. Stephen Smith, it is well done, and is sure to be successful."—PROF. FRANK H. HAMILTON, *New York.*

For Sale by Booksellers. Sent, postpaid, on receipt of the price by the Publishers.

WYETH'S
DIALYSED IRON.

(FERRUM DIALYSATUM.)

A Pure Neutral Solution of Peroxide of Iron in the Colloid Form. The Result of Endosmosis and Diffusion with Distilled Water.

PREPARED SOLELY BY

JOHN WYETH & BRO.,

PHILADELPHIA.

This article possesses great advantages over every other ferruginous preparation heretofore introduced, as it is a solution of iron in as nearly as possible the form in which it exists in the blood. It is a preparation of invariable strength and purity, obtained by a process of dialysation, the iron being separated from its combinations by endosmosis, according to the law of diffusion of liquids. It has no styptic taste, does not blacken the teeth, disturb the stomach, or constipate the bowels.

It affords, therefore, the *very best* mode of administering

IRON

in cases where the use of this remedy is indicated.

The advantages claimed for this form of Iron are due to the absence of free acid, which is dependent upon the perfect dialysation of the solution. The samples of German, French and American Liquor Ferri Oxidi Dialys. which we have examined give acid reaction to test paper. If the dialysation is continued sufficiently long, it should be tasteless and neutral.

Our dialysed Iron is not a saline compound, and is easily distinguished from Salts of Iron, by not giving rise to a blood-red color on the addition of an Alkaline Sulpho-Cyanide, or a blue precipitate with Ferro-Cyanide of Potassium. It does not become cloudy when boiled. When agitated with one part of Alcohol and two parts of Ether (fortior), the Ether layer is not made yellow.

Physicians and Apothecaries will appreciate how important is the fact that, as an antidote for Poisoning by Arsenic, Dialysed Iron is quite as efficient as the Hydrated Sesquioxide (hitherto the best remedy known in such cases), and has the great advantage of being always ready for immediate use. It will now doubtless be found in every drug store, to supply such an emergency.

Full directions accompany each bottle.

Physicians will find our DIALYSED IRON in all the leading drug stores in the United States and Canada.

It is put up in bottles retailing for **ONE DOLLAR**, containing sufficient for four months' treatment. Large size is intended for hospitals and dispensing. Retail at $1.50. Price Lists, etc., sent on application.

Lecture.

HYPERTROPHIC ELONGATION OF THE SUPRA-VAGINAL PORTION OF THE NECK OF THE WOMB.

BY WM. GOODELL, M.D.,

Professsor of Clinical Gynæcology in the University of Pennsylvania.

Gentlemen:—I have an exceedingly interesting case to bring before you to-day, more interesting on account of the unusual size of the growth, and on account of the cause which produced it. Here is a woman who was married ten years ago. She and her husband soon began to have children, but finding that they were coming too rapidly, they used means for preventing conception. The method adopted was that of withdrawal, in which the male organ is removed at the crisis of the orgasm. The result was that the uterus and other sexual organs were left in a state of extreme congestion; and in consequence of the incomplete expulsion of the semen from the vasa differentia, there was a constant irritation of the male organ, which led to frequent coition, and thus the uterus was kept in a state of permanent congestion. The result is that we have a remarkable enlargement of the cervix, occupying principally the supra-vaginal portion. You see a large tumor projecting from the vulva, looking like the penis of a horse. I introduce the sound, and find that the uterus measures six inches. We also have a few points of ulceration, due, probably, to the trickling of the urine, or to friction against the clothing. Anteriorly there is no vagina at all, it is wholly prolapsed.

In regard to the cause of this hypertrophy, my attention has been called to the fact that it is often due to means adopted to prevent conception, by seeing a number of cases of late in which it had this origin. I have never seen but one case in which the hypertrophy was greater than in this; in that the womb measured a trifle less than seven inches. I can pass my index finger into the cervical canal, and evidently coition has of late taken place through the os.

This is a case of hypertrophic elongation of the supra-vaginal portion of the neck of the womb. What shall I do in this case? The woman does not suffer much, but the presence of this mass is, of course, a discomfort, and no woman likes to carry a tumor like this around with her. There are two things that should be done in such a case: one, to remove as large a portion of the cervix as possible, which will leave a large, raw surface, to heal by granulation, which will take some time to cicatrize; and if the operation is successful, we shall find, at the end of six months, or even a shorter time, owing to the retrogressive influences set up by the granulation of this surface, that the womb will be no larger than normal. The other thing to do is, to narrow the vulva to a certain extent, as the perineum has become weakened by the constant pressure of this hypertrophied cervix.

Now, in regard to the removal of this mass: if I should take the wire of an ecraseur, pass it around the tumor, and cut it off, I should then be very apt to remove a portion of the peritoneum forming Douglas' pouch, or a part of the bladder. We have no means of telling how far down Douglas' pouch extends, but we can define the limits of the bladder by passing in a sound, or the little finger. I have never yet wounded the

bladder, and I should feel very much ashamed of myself if I did.

I propose to remove this by the galvano-caustic instrument. I first dilate the urethra, by passing in a uterine dilator. It goes in perpendicularly, on account of the urethra being dragged downward; she has dysuria, for the same reason.

Women with this condition of things have been impregnated, but it is a rare occurrence, for the body of the uterus undergoes changes similar to those that take place in the cervix, which render it unsuitable for conception. I have often had women come to me after sterility had been brought on by the means used to prevent conception, to see if I could not get the womb again in a condition to bear children.

I now introduce my little finger carefully into the bladder, so as to be sure not to include a portion of it in the wire. There is one point I always feel a little nervous about, and that is Douglas' pouch, as I cannot tell how far down it extends. We shall now apply the loop of wire, and pass the current through it, heating it red hot. We cut the mass off slowly, in order to diminish the danger of hemorrhage. We now have removed the cervix; it looks like a potato that has been cut with a rusty knife. I have not injured either Douglas' pouch or the bladder. I could probably have removed a greater portion, but it was more prudent not to do so. There is a serious objection to the performance of this operation. It is that we may have cicatricial contraction and occlusion of the os; but this rarely occurs, because the os is usually so much larger than it should be.

I shall not perform the operation on the perineum to-day, for we may have secondary hemorrhage when the sloughs separate from this large surface, and it will be easier to stop the bleeding if the vulva is not contracted. I have performed both operations at the same time, but I do not think that it is a good plan.

The after treatment will be a mild, supporting one; quinine, if necessary, with milk and beef tea for two or three days. In the course of a couple of days we shall have a purulent discharge, which, probably, will be offensive. I will then use injections of a solution of permanganate of potassium. To-night her temperature will probably be a little high, 100° or 101°. If this continues, I shall use quinine in large doses, twenty or thirty grains during the twenty-four hours, giving ten-grain doses at a time. I think that ten grains of quinine given in one dose exerts a more marked effect upon the temperature than the same quantity given in divided doses. I give it until I have a decided effect—buzzing in the ears, etc.

I never had any trouble from peritonitis following this operation, except in one case. Several years ago I operated, and had a severe general peritonitis follow. I did not get into Douglas' pouch, but I must have come very near it. I am sorry to say that the patient died within forty-eight hours. The principal danger that I fear after the use of the hot wire is the secondary hemorrhage, and I am not certain but that it would be better to use the cold wire whenever practicable. A disadvantage of the cold wire is that it is more apt to draw in a fold of the bladder or of Douglas' pouch.

From the pressure of this mass there has been a loss of functional power in the perineum, which will probably require a second operation. It may be that the operation I have performed to-day will be enough.

Let us now see how much the womb has diminished in size. I apprehend that it does not measure more than four inches. I introduce the sound, and find that it does not measure four inches, only three and one-half. What is the reason for this diminution; for you see that I have removed not more than an inch and a quarter? I account for this in two ways: in the first place, the womb was, on account of its elasticity, stretched by the weight of this mass, and accordingly the elastic fibres of the uterus have themselves become shorter. In the second place, the heat of the wire has caused shrinkage, by irritation. In the course of six months this womb will not measure more than 2.5 inches.

Communications.

ON THE THERAPEUTIC USE OF DUBOISIA IN EYE DISEASES.

BY DR. M. LANDESBERG,
Of Philadelphia.

The alkaloid, duboisia, has lately been extracted by A. W. Gerrard and Petit, from duboisia myrapoides, an Australian corkwood tree, belonging to the order *Solanaceæ*, which grows especially in New South Wales, Queensland, New Caledonia, and New Guinea. The sulphate salt is of yellowish color, and soluble in water, in the proportion of 1 to 120. The physiological properties are identical with those of atropia. According to Ringer (*Lancet*, March 2d, 1878), duboisia causes dryness of the mucous membranes of the mouth and the throat, gives rise to headaches, reduces the secretion of the skin, and checks effi-

ciently the action of muscarin on the heart. Marmé has found that if dogs are so far poisoned with morphia that the heart's action has fallen to two or three beats in five seconds, and the respiration has become irregular, the injection of small doses of duboisia beneath the skin immediately strengthens and accelerates the heart, and quickly renders the breathing regular (*Medical Times and Gazette*, February 8th, 1879).

The mydriatic actions of duboisia are more powerful and more rapid than those of atropia. Complete mydriasis and paralysis of the muscle of accommodation follows the application of duboisia in a much shorter period than it was ever accomplished by atropia of equal strength of solution. Besides, duboisia has this advantage over atropia, that its protracted use does not irritate at all, or only very little, the conjunctiva of the eyeball, whereas atropia very often sets up irritation to such a degree that its application has in many instances to be desisted from. In such cases of irritation, or in cases where there existed intolerance of or idiosyncrasy to atropia, the attending physician was placed in a very embarrassing position. Could he not dispense with the further use of a mydriatic, he had to recur to the extracts of belladonna or hyoscyamus, either of which is of very little efficiency, or to daturin, a pure preparation of which is hardly to be found, and an impure preparation sets up severe symptoms of irritation. It is, therefore, of the highest importance to the oculistic therapeutics to have found in duboisia a remedy, the therapeutic value of which is not only far superior to atropia, but which may be used without any inconvenience in all cases of idiosyncrasy to atropia, and in those in which the application of the latter is contraindicated by existent symptoms of irritation of the conjunctiva. I commenced the use of duboisia in the spring of the year, induced by the following case:—

U. G., saloon keeper, thirty-five years old, came under my treatment May 8th, 1878, suffering from entropium, trichiasis, keratitis pannosa, and xerosis conjunctivæ of both eyes. He was given a solution of atropia, one grain to three drachms, of which he used in the beginning one drop every hour, afterward two drops daily. The applications were borne without the least trouble until the last days of December, when inflammation and swelling of the lids set in, accompanied by lachrymation and photophobia. The skin of the lids and of the surrounding parts became tense, dry and rough. Erysipelas developed, gradually invading the whole face up to the scalp. After complete recovery had set in, the patient was advised to renew the applications of atropia, which had been discontinued for about three weeks, during the whole course of the morbid process. Half an hour after the administration of one drop of atropia great irritation of the conjunctiva appeared, with swelling and inflammation of the lids, which symptoms subsided within two days, when the further applications of atropia were discontinued. Supposing I had to deal in this instance with an impure preparation of atropia,* I ordered a fresh solution to be made by a reliable druggist, of which I instilled myself one drop into each eye. The immediate effect was burning pain, great irritation of the conjunctiva, which was followed in the course of the day by swelling of the lids and dryness of the skin. These symptoms subsided within two days, to reappear as often as atropia was instilled. I was thus convinced that I had to deal with a case of idiosyncrasy to atropia.

The continuation of a mydriatic being indicated, I resolved to try the effect of duboisia, which had to be ordered, for this purpose, from Paris. During the interval of about two months no atropia was used; lids and surrounding parts remained in healthy condition.

In order to exclude any error whatever of observation, and to avoid even the influence of the imagination of the patient, I tried again the effect of atropia on the eyes, before resorting to the administration of duboisia. March 25th, I instilled one drop of a fresh solution of atropia into each eye, the patient being ignorant of the nature of the preparation. Two hours after the administration inflammation and swelling of the conjunctiva and the eyelids set in, combined with photophobia and considerable headache. Vision became dim; the face red and distended. Pupils remained contracted to the utmost.

March 26th, when the symptoms of irritation were unabated, I instilled into each eye one drop of a solution of duboisia, half a grain to three drachms, repeating the dose in intervals of fifteen minutes. Fifteen minutes after the first instillation there was slight dilatation of the pupils; fifteen minutes after the second instillation there was medium mydriasis, and fifteen minutes after the third instillation there was

* Many druggists of this city keep on hand a strong acidulated solution of atropia, of which they dispense the prescribed dose, the extemporaneous dispensation of a small dose being too troublesome to them. This procedure was revealed to me by a druggist, when I once asked him the cause of many patients complaining of smarting consequent upon the application of atropia.

complete mydriasis. All symptoms of irritation gradually subsided, and the use of duboisia was continued for months, without the least annoyance to the patient.

A second case of idiosyncrasy to atropia, in which duboisia was substituted most successfully, I observed in Miss R., fifteen years old, who suffered from myopia maxima progressiva, combined with slight conjunctival catarrh and blepharodenitis. She was given a solution of atropia, one grain to three drachms, to instill one drop into each eye three times a day. In the first three days atropia was very well borne, but from the fourth day violent irritation of the conjunctiva and the lids set in, followed by considerable swelling of the conjunctiva of the eyeball and eczema of the lower lids. These symptoms abated the moment atropia was discontinued, to reappear again as soon as the instillations were renewed. In spite of the existent condition of inflammation, I ordered a solution of duboisia, half a grain to three drachms, one drop of which to be instilled three times a day. The remedy had the best effect. All symptoms of irritation vanished. Pupils became dilated to the utmost, and mydriasis was maintained for about two months, without the least trouble to the patient.

Another case of intolerance and inefficiency of atropia, in which duboisia was used, with the best result, I had occasion to observe in Mrs. B., sixty-six years old, who had always enjoyed good vision until eight weeks ago, when, consequent upon a violent fit of coughing, a dark cloud appeared before her right eye, the sight of which gradually diminished, in spite of the treatment to which she had been submitted.

In order to make a thorough examination of the background of the eye, I instilled two drops of a solution of atropia, one grain to three drachms. There was no effect whatever after fifteen minutes, and only a slight one after ten drops of atropia had been instilled within half an hour. Patient was ordered a solution of atropia, half a grain to two drachms, one drop of which to instill every two hours.

When I saw the patient the following day the pupil was but very slightly dilated. The anterior ciliary veins were greatly distended. There was considerable episcleral injection, and tension was increased. On instilling two drops of a solution of duboisia, half a grain to three drachms, complete mydriasis set in within ten minutes. The pupil of the left normal eye was somewhat myotic and of very slow reaction. In order to test its reaction on atropia, I instilled, within a half an hour, about five drops of atropia. Pupil became only medium dilated; remained in this condition the following day, gradually and slowly reassuming its normal shape.

Eight days later I took the opportunity to test the reaction of the same pupil on duboisia. Previous to the instillation the pupil was contracted to the utmost. I instilled one drop of a solution of duboisia, half a grain to three drachms. The result was, after five minutes, no effect; after six minutes, beginning of dilatation; after ten minutes, pupil dilated above the medium; after fifteen minutes, pupil dilated almost ad maximum.

The beneficial action of duboisia was also proven in the following case of very violent irritation of the ciliary branches of the fifth pair:—

Mrs. B., thirty-five years old, who was under my treatment on account of myopia progressiva, was suffering for years from intermittent attacks of very violent half-sided trigeminal neuralgia of the face, which caused intense irritation of the respective eye. The symptoms were as follows: Intense subconjunctival and conjunctival injection, intense swelling of the lids, considerable chemosis of the conjunctiva of the eyeball, photophobia and lachrymation. The eyeball was tender to the touch. Vision was not impaired, and background of the eye normal. Paroxysm continued for several days, with unabated violence. Recovery was very slow.

While in the period of the free intervals, mydriasis, consequent upon atropinization, was complete and equal in both eyes, the condition changed the moment a paroxysm broke out. The pupil of the respective side of the face became contracted, and remained so during the whole duration of the neuralgia, in spite of the continued use of atropia. Sometimes the eye remained, even in the free intervals, irritated to such a degree that the pupil could not become dilated at all, or was only medium dilated, in spite of hourly instillations of atropia, whereas complete mydriasis of the other pupil was maintained by two drops a day.

In the course of such a left-sided attack, I resorted, March 27th, to duboisia, using, three times a day, one drop of a solution of half a grain to three drachms. On the following day the pupil was medium dilated. April 1st, there was complete mydriasis, which was maintained in spite of the violence of the paroxysm. The use of duboisia for the left eye was continued in the free intervals, and as it so happened that for the time the patient was under my observation the neuralgia always set in in the left side of the

face, I had ample opportunity to observe in this instance the further effect of the new remedy. In all subsequent paroxysms, mydriasis diminished somewhat, pupil becoming medium dilated; but in no attack mydriasis subsided entirely. Complete mydriasis set in as soon as the acme of the paroxysm was broken. The instillations of duboisia were very soothing to the patient.

The effect of duboisia in conjunctivitis follicularis, consequent upon the protracted use of atropia, was observed in the case of B. W., thirty-six years old, suffering from myopia maxima progressiva. In the course of the treatment with atropia, conjunctivitis follicularis developed, causing very unpleasant symptoms of irritation. The continuation of a mydriatic being indicated, I resorted to duboisia, in the usual solution of half a grain to three drachms, instilling into each eye one drop three times a day. Within two days the symptoms of irritation subsided, and in the course of two weeks conjunctivitis follicularis vanished. Duboisia was continued for more than six weeks, without causing any annoyance.

In no case did I observe the occurrence of conjunctivitis follicularis, or of any irritation of the conjunctiva, consequent upon the protracted use of duboisia. In all cases in which there already existed inflammation of the conjunctiva, the instillations of duboisia were borne without the least injury. Duboisia proved to be a remedy of never-failing action in all those cases of accommodative asthenopia, with spasm of accommodation, in which the protracted use of atropia did not succeed to bring about complete paralysis of the muscle of accommodation. The following cases may illustrate best the action of duboisia in these instances—

1. P. W., tailor's wife, forty-seven years old, of hysteric and nervous constitution, complains of headaches, of permanent pressure in forehead and temples, of great pain in eyes when looking at near objects, of nausea, and even vomiting, when reading or sewing for a few minutes. The affection had existed for about two years. No benefit had been derived from the different kinds of treatment to which she had been submitted. Refracting media are clear. Function of the muscles is normal. Background of the eyes shows venous hyperæmia. V. of each eye $\frac{20}{30}$. Every attempt at reading is followed by spasm of the lids. With concave $\frac{1}{20}$, Jaeger 3 is read fluently.

After a three weeks' use of atropia (one grain to three drachms), in the first day one drop every hour, afterward one drop three times a day, pupils are dilated below the medium, and action of the ciliary muscle is hardly weakened. There is H. R. $\frac{1}{30}$, H. L. $\frac{1}{24}$, V. $\frac{20}{30}$.

A solution of duboisia (one-half grain to three drachms) was prescribed, one drop of which to be used on the first day every hour, and then every two hours. After a three days' use of duboisia, pupils were dilated above the medium, and there was H. R. $\frac{1}{13}$, H. L. $\frac{1}{15}$, V. $\frac{20}{30}$. Three days later, there was complete mydriasis and complete paralysis of the muscle of accommodation. H. R. $\frac{1}{10}$, H. L. $\frac{1}{12}$, V. $\frac{20}{20}$; with + 5 Jaeger 1, at 5″.

On the eighth day after the discontinuance of duboisia, examination showed H. R. $\frac{1}{30}$, H. L. $\frac{1}{24}$, V. $\frac{20}{20}$; with + 17 Jaeger 1, from 7″–13″; Jaeger 3, from $6\frac{1}{2}$″–18″. Pupils of normal condition. Complete recovery.

2. K., brewer's daughter, sixteen years old; is suffering for several months from asthenopic troubles, which prevent her from continuing her studies. Examination shows H. R. $\frac{1}{30}$–$\frac{1}{24}$, V. $\frac{15}{40}$; H. L. $\frac{1}{16}$, V. $\frac{15}{50}$; with + 6 R. E., Jaeger 1, with difficulty; L. E. Jaeger 3; slight strabism divergens of the left eye. A two weeks' treatment with atropia gave the following result: pupils dilated above the medium; H. R. $\frac{1}{16}$, H. L. $\frac{1}{10}$, V. $\frac{15}{40}$. Paresis of the muscle of accommodation. April 3d, I prescribed a solution of duboisia, half a grain to three drachms, one drop of which to be used every hour in the first day, and then every three hours. The result was, April 9th, pupils dilated ad maximum, H. R. $\frac{1}{9}$, H. L. $\frac{1}{12}$, V. $\frac{15}{30}$. April 13th, H. $\frac{1}{12}$, V. $\frac{15}{20}$ of each eye. Complete paralysis of the muscle of accommodation. After the effect of duboisia had subsided, examination, made April 24th, showed H. R. $\frac{1}{24}$, H. L. $\frac{1}{20}$, V. $\frac{15}{20}$. Slight insufficiency of the internal muscles, compensated at reading distance by a prism 2°, base inward, before each eye. With + 18, combined with a prism 2°, base inward, Jaeger 1, from $4\frac{1}{2}$″–10″; Jaeger 3, from 3″–15″. The patient is using the above-stated glasses for about five months, and is able to continue her studies without any trouble whatever.

3. H., music teacher, forty years old, applied to me on account of amblyopia and strabism divergens of his right eye. He wears glasses + 18 to which prisms 5° base inward, were added in the last months by an optician.

Examination made April 7th showed H. L. $\frac{1}{50}$, V. $\frac{15}{15}$, Jaeger 1, from $6\frac{1}{2}$″–15″; H. R. $\frac{1}{40}$, V. $\frac{15}{100}$. Convex $\frac{1}{40}$, combined with concave cylindric glasses $\frac{1}{20}$, H. M., brings V. to $\frac{15}{70}$, Jaeger 7, with + Jaeger 3. Very fine opacities of the

cornea. Strabism divergens of the right eye. An eight days' use of atropia for the right eye had the following result: H. $\frac{1}{30}$, V. $\frac{15}{70}$. Combination with concave cylindric glasses $\frac{1}{20}$, H. M., brings V. to $\frac{15}{50}$. Pupil medium dilated. A seven days' use of a solution of duboisia (one-third of a grain to three drachms), four drops a day, caused complete mydriasis and complete paralysis of the muscle of accommodation. Examination made April 18th showed H. R. $\frac{1}{18}$, V. $\frac{15}{40}$. Cylindric glasses do not improve vision. After the effect of duboisia had subsided, I made, April 28th, tenotomy of the external rectus of the right eye. Examination made March 9th, showed H. R., $\frac{1}{50}$, V. $\frac{15}{30}$, H. L. $\frac{1}{60}$, V. $\frac{15}{10}$; with + 30, R. E. Jaeger 1, from 5″–15″, L. E. Jaeger 1, from $4\frac{1}{2}$″–22″. The patient was ordered glasses of convex $\frac{1}{50}$ for the right eye, and of convex $\frac{1}{60}$ for the left eye, for constant wearing, and glasses of convex $\frac{1}{30}$, combined with prism 1° base inward, for each eye, for reading. The patient is able to use his right eye as well for distant as near work.

4. N. J., carpenter's wife, forty-five years old, is complaining of headaches and pressure in forehead and temples when attempting to read or sew. She had used in a short time different numbers of glasses without getting any relief of her troubles. Examination, made July 14th, showed H. R. $\frac{1}{30}$–$\frac{1}{20}$, V. $\frac{15}{30}$, H. L. $\frac{1}{18}$–$\frac{1}{14}$, V. $\frac{15}{40}$; with + 6. R. E. Jaeger 1, L. E. Jaeger 2. Reaction of pupils very slow. The right pupil is larger than the left, and a normal one. Intraocular pressure and fundus oculi normal. On atropinization, using in the two first days one drop of a solution of one grain to three drachms every hour, then one drop four times a day, there was, July 30th, H. R. $\frac{1}{12}$, H. L. $\frac{1}{10}$, V. $\frac{15}{20}$. Pupils medium dilated. After a three days' use of a solution of duboisia, half a grain to three drachms, in the first day one drop every hour, then one drop four times a day, pupils became dilated ad maximum, and there was H. R. $\frac{1}{7}$, H. L. $\frac{1}{6}$–$\frac{1}{2}$, V. $\frac{15}{20}$. Paralysis of accommodation. The continued use of duboisia for further five days did not alter the above condition.

Examination made August 19th, when the pupils were normal, showed H. $\frac{1}{24}$ V. $\frac{20}{20}$, of each eye; with + 11 Jaeger 1, from 7″–15″. Jaeger 3, from 5″–30″. All asthenopic troubles have vanished. With the ordered glasses the patient is able to work for hours without the least inconvenience.

In several cases of myopia and hyperopia, combined with considerable spasm of accommodation, I applied from the beginning a solution of duboisia, and succeeded, in a very short period, in bringing about complete paralysis of accommodation, and obtaining the real condition of refraction.

In many cases of myopia and hyperopia, without spasm of accommodation, I used duboisia in order to ascertain at the first consultation the whole degree of refraction. Paralysis of the muscle of accommodation was more quickly obtained, and the normal condition much sooner restored than I ever observed it in atropinization.

The efficacy of duboisia in tearing posterior synechiæ was tested by me in two cases, without any success. In the first case I had to deal with a mechanic, thirty-one years old, who had lost his left eye, consequent upon a blow ten years ago. Enucleatio bulbi had been made ten days following the lesion. In the last year the patient began to suffer from inflammation of his right eye. Upon examining him, March 19th, I found slight subconjunctival injection, some posterior synechiæ, and small exudations on the capsule of the lens. On atropinization, the pupil dilated irregularly. Background of the eye showed in its peripheric parts some choroideal atrophies and pigment macerations. The alternate use of atropia and eserine did not produce the slightest effect. But no better results were obtained by the substitution of duboisia for atropia.

The second case was that of a clerk, whose right pupil showed two small posterior synechiæ, consequent upon a fresh iritis. Here also the alternate use of duboisia and eserine did not succeed in tearing the fresh, thin synechiæ. During the treatment of the syphilitic iritis atropia had been used.

General constitutional effects, consequent upon the use of duboisia, I only observed in two cases:—

1. R., merchant's son, nine years old, was ordered hourly instillations of duboisia. After the administration of four drops, slight symptoms of fever set in, increasing on further four drops. When instillations were stopped for one day, fever subsided, and the boy continued to use one drop of duboisia every three hours, without the least trouble.

2. F. C., merchant, thirty-five years old, felt dryness in his throat the first day of his using one drop of duboisia every hour, which spontaneously disappeared the following day, the dose not being diminished. The patient, suffer-

ing from chronic inflammation of his throat, had once been given atropia for his eyes, when such disagreeable symptoms of irritation of his throat set in that the remedy had to be discontinued.

With the view of determining the relative physiological action of duboisia and atropia on normal eyes, I have performed a series of experiments, as follows: I instilled at the same time into the one eye one drop of a solution of duboisia (half a grain to three drachms) and into the other eye one drop of a solution of atropia (one grain to three drachms), noting at intervals of five minutes the effects of either preparation on the pupil and the accommodation of each eye. These experiments, made in fifty cases, showed that the action of duboisia on the pupil and the muscle of accommodation is more powerful and quicker than the action of atropia. Further experiments have convinced me that the effects of duboisia on the pupil and the muscle of accommodation pass away much sooner than those of atropia.

1912 *Arch street.*

NARCOTINE AMAUROSIS, WITH FOUR CASES.

BY L. G. ALEXANDER, M.D.,
Of Hopkinsville, Ky.

There are many obscure diseases of the eye met with in general practice, especially among country and village doctors, where they have not the skilled assistance of their more favored city brethren, and are often in doubt, not finding in their text books analogous cases.

In the following four cases I give my own experience, as occurred in my general practice:—

The first case relates the disease as it existed in myself. It was not until I got my fifth case that I fully realized the cause of the trouble and was able to diagnose correctly why it existed, and the best means of treatment. I now quite often recognize cases of the kind in their incipiency, and by the experience gained can easily relieve them—more properly by removing the cause—with very little medicine; the *vis medicatrix naturæ* is sufficient to the desired end. The use of tobacco is so general that its bad effect can hardly be estimated; so much has been written, pro and con, that to discuss the subject is superfluous. The rapid increase of nervous people, nerve pain, neuralgia, and obscure nervous disease, is seen in practice every day by the physician, and so frequent as to attract the attention of the laity, and it is my belief that the common use of tobacco, as well as alcohol and opium, is the most prominent cause of so many nervous troubles. From observation, I have found that the children of parents addicted to the use of tobacco are more likely to have nervous diseases than others born of parents who do not use it; and if both parents use it, we are almost certain to find the offspring of a nervous temperament, and especially liable to nerve derangement. It is from this class that the drunkards are mostly recruited, growing up with a weak nerve development. Any physical or mental exertion brings on the disease now so common, neurasthenia.

Case 1.—L. G. A., aged 26 years, practicing physician, addicted to the habit of smoking from five to ten cigars a day. February, 1872. On getting up, the morning being very clear, I noticed that there was a slight haze before my right eye. I paid no attention to it. In a few days the visual field was perceptibly narrowing; in the upper right corner of the field the haziness was more decided, the appearance being as if a dense group of cobwebs was immediately over that part of my eye. The condition became more and more distinct. Becoming uneasy, I consulted, by letter, Prof. Gross, who advised me to lose no time, to go to some specialist, which I did. On an ophthalmoscopic examination, he said nothing abnormal could be distinguished, except venous hyperæmia of the retina. He thought the cause to be quinine. I had been taking some for an occasional obstinate tertian intermittent. I never had any venereal disease, nor used alcohol. I was put on a general tonic treatment, and rested from practice. I then consulted another, a German specialist, of well known reputation. He diagnosed malaria as the cause; recommended antiperiodics. My general health was very good, except deficient secretion from the kidneys. For two months this treatment was followed. My sight rapidly grew worse. The enlarged veins, or congestion of the retina, could be distinctly seen by myself (the cornea and sclerotica, in this and all my cases, have been perfectly clear). There was an appearance as if there was water on the retina, or floating strings in the vitreous. On the morning of the 7th of May, when I arose, there was a large extravasation of blood in the retina, evidently from rupture of some of the engorged veins, covering one-sixth of the visual field; in a few days the clot began to break up into small fragments, and was absorbed. This was repeated several times during the ensuing six weeks, and the left eye began to be affected. I then consulted Prof. E. Williams, of Cincinnati. He diagnosed the case as neuro-retinitis, giving me no hope. At this time I

could not read No. xxx of Jaeger or Snellen. The ophthalmoscope showed tortuous vessels; the retina generally hazy, from the excessive hyperæmia. He prescribed mercury and iodide potassa, with the hope, as he said, that it might do some good, with leeches to the temple twice a week; to stop smoking and using quinine, and to come back at the end of four months. These directions were followed out. At the end of six weeks, I, for the first time, saw some improvement in my right eye; the left had decidedly improved. As I began to get my vision, there was a peculiarity which I have found in all my cases; a distant object could be distinguished, if it was black; in my case, I could see a tall, burnt, charred, limbless tree at the distance of a quarter of a mile, when I could not see a large white house at any distance, though in the range of the tree; but if the doors were open, I could readily distinguish the dark places well enough to know and speak of it to those whom I was with. This peculiarity has existed in all of my bad cases. When the disease is developed, if the patient is out in the night, there is a constant appearance as of a branch of a tree, or as if one was running against some object, as a tree or animal. This is a constant recurring delusion, which was, in my case, very annoying. Also a peculiar hyperæsthetic condition of the retina; to look at an object and shut the eye, the impression would be retained for an indefinite period. Flashes of light were constant, and showers of muscæ volantes. A touch on the face anywhere would produce the circular flashes. At the end of three months I had decidedly improved, could see large type, and distinguish objects. From this time on improvement was rapid. At the end of four and a half months I again consulted Dr. W.; could then read No. 1 of Jaeger slowly. He then told me that his opinion when he first saw me was that my disease was tumor of the brain, but that he now was not able to say what had been the cause of the disease of the retina. Ophthalmoscopic examination showed that the retina was nearly normal. At this writing, October, 1879, I have excellent vision, can read the smallest type easily and rapidly. In the right eye there are some enlarged veins, that appear like strings, and one circular spot, where the large extravasation of blood was. The left eye, in the upper and outer field of vision, has a plexus of enlarged vessels, like a bunch of grapes. These are the only remains of the serious trouble which I experienced (at no time was there any cephalalgia or pain). For two years after my eyes were very weak. I wore dark blue eye protectors for two years; now the strongest sunlight does not hurt me.

Case 2.—T. G., farmer, twenty-three years old; good habits; never had venereal; excellent health; an excessive user of tobacco; consulted me at the time I was under treatment myself. He had been treated by several physicians. Disease commenced in the right eye, followed in two months by the left one becoming affected. Trouble began six months before; pupil dilated; responded feebly to light; had to be led; could not distinguish objects, except a dark one, as, for instance, an open door in a barn. I recommended him to consult Dr. N. He was not able to do so. This case resulted in complete blindness. (The right eye first became affected; no pain; cornea and conjunctiva clear.) No ophthalmoscopic examination made.

Case 3.—L. U., farmer, aged forty-two years; general health good; free from all constitutional disease; never had venereal; complains of gradually diminishing vision in right eye; misty and clouded; flashes of light, muscæ volantes; at night appears as if a limb of a tree was across his path, or he was running against some object. The field gradually narrowing; cannot distinguish large type. Sent him to Dr. W. for ophthalmoscopic examination. There was excessive hyperæmia of retina, of venous kind; appears as if there were crystals in the vitreous, or attached to the inner or vitreous side of the retina. Dr. W. prescribed alteratives, mercury and iodide of potassa, leeches to the temple. The treatment was followed out, but no amendment of disease. Soon the left eye began to be affected. I then forbade him smoking, gave iodide of potassa, strychnia and leeches to the temple, when the left eye rapidly cleared up, but the right one was lost. At this time, six years after, his vision is excellent in the left eye. (Disease first in right eye; free from pain; eye clear; pupil responded to light.)

Case 4.—Aged thirty-six years, mechanic; user of tobacco; cloudy or hazy before right eye; forbade the use of tobacco; gave strychnia, iodide of potassa, alternate with bromide of potassa. Result of case: good vision (he had all the symptoms of the three preceding cases, in a milder form, though he never complained of the left eye). It was while treating this case that I, for the first time, began to suspect that it was tobacco that produced the disease. I searched all the text books I had, but could not find any cases of the kind. I accidentally found a translation from the French of Grilliot that explained these cases. Since which I have no trouble in diagnosing and

successfully arresting these cases, which are more frequent than one would suppose; and if the use of tobacco is forbidden, with strychnia, potassa and alteratives, we can arrest the disease. Grilliot says: "Tobacco amaurosis always commences in one eye, and that at first it is never bilateral." Hutchinson is of the same opinion. Grilliot states that the right eye is always the first to become diseased. (This has been my experience.) Apostol and Hutchinson say either may first show disease. In tobacco amaurosis the patient at first sees through a mist or a cloud, which gradually narrows the field of vision, becoming more dense as it progresses; at the same time, with the most of these exists a central scotoma. This is admitted by Apostol and Wecker, but not by Follin. Wecker says there is a diminution of the central acuteness, while the peripheral sensibility remains normal. Follin says we have cephalalgia, which I have never seen to occur. Wecker tells us that the patient sees yellow. I have never known this to exist, unless the circular flashes could be called such, they, in my own person, being of a dull flame color.

Most authors write of confusion of colors (I never found this state to exist); that the patients see better at night, and that the pupils are contracted (I have found the pupils generally normal at first; as the disease increases slight dilatation ensues). Hutchinson says that if the disease progresses with sufficient rapidity, as in Case 2, atrophy of the papilla ensues, but that generally the cases are amenable to treatment; that very soon vision may be promised the patient. Differential points in the diagnosis of this and alcoholic amaurosis are, narcotine begins first in one eye, alcohol in both, though the central scotoma exists in each condition. Muscæ volantes is only found in tobacco amaurosis; in alcohol amaurosis we have confusion of colors, but never in tobacco. Though both diseases may terminate in atrophy of the papilla, the tobacco can be much more rapid in its progress. Alcoholic cases see better at night; narcotine do not. If we take the points into consideration, a clear diagnosis is easily made, and with careful treatment and abstinence from the provoking cause vision is restored. A relapse of all the symptoms is readily induced if the patient goes back to his old habit of using tobacco. The best treatment of the cases is strychnia, with iodide of potassa, bromide, tonics, general hygiene, in some cases leeches, and mercury, the best preparation being corrosive sublimate. Eye protectors should be worn, of dark blue or smoked glass, for months.

A CASE OF TWINS IN A PRIMIPARA; SPONTANEOUS VERSION, ASPHYXIA AND POST-PARTUM HEMORRHAGE.

BY DAVID CERNA, M.D., PH.D.,
Of Philadelphia.

On the 27th of October, at 2.30 A. M., I was hurriedly called to attend Mrs. C., who was in her first labor. On arriving at the house, I found that a living child had just been expelled. On questioning the woman who was in attendance before me pretty closely, I learned that the child had been born without the slightest difficulty, having come into the world in "the natural way," *i.e.* by the head. The pulsations of the cord having stopped, the latter was tied and cut, the placental end being left untouched. There was no hemorrhage of any account. Without suspecting any further trouble, I proceeded to deliver the placenta by Crede's method, but before I applied my hands to the abdomen, to make pressure, I found that it remained unusually large. The pains had completely disappeared.

On making a digital examination, I felt a structure resembling a foot. My suspicions were then aroused as to the existence of a second child in the womb, which were strengthened by further examination. On applying my ear to the abdomen, I detected fœtal heart sounds, very high up, and also a perfect placental bruit. I diagnosed breech presentation, which was proven by a still further and more careful vaginal examination, when I found both feet presenting.

For fully half an hour I waited, but vainly, for the occurrence of the pains. I then gave the lady, by the mouth, a teaspoonful of Gibb's fluid extract of ergot (an excellent preparation). In fifteen minutes after the ingestion of the dose a good pain occurred, followed by others at intervals of ten minutes or so. At 4.20 the bag of waters was ruptured, during a pain. For fifteen minutes after the rupture of the membranes no pains occurred. The index finger of my left hand was then introduced into the vagina, while I made slight friction, with my right hand, over the abdomen. As the result of this, a good and long pain occurred. The uterus contracted most vigorously. Suddenly the woman, almost exhausted, uttered a painful cry; the presenting feet disappeared, as it were, from the touch of my finger, and in a few moments later I discovered *the head of the child presenting, in the first position of the vertex.* The exterior contractions then ceased, but the lady was told to strain as hard as she could, by which method the head was soon afterward delivered. A pain came, and that sufficed to expel the rest of the body. The

child, however, was born in a state of complete asphyxia. Without a second thought, I proceeded to apply artificial respiration. Warm and cold water douches, alternately, to the chest, were employed for a few moments only, inducing by this means a few gasps. Silvester's method was then resorted to, by which, fortunately, I was enabled to bring the child to life. When the rhythmical respiratory movements were established, the cord was tied and cut, and my attentions were then directed to the mother.

Firm pressure with both hands on the fundus of the uterus was sufficient to deliver the placenta, by which also all clots were removed. The bandage was then applied. The placenta, which was a double one, was healthy in every respect, there being two amnionic sacs and two umbilical cords.

I was about to leave the house, thinking all my troubles had ceased for the time being, when the lady told me that she thought she was flowing. On ocular inspection, I saw that she was right. At first the hemorrhage was slight, but as the flow increased I became alarmed. I instantly called for vinegar, which I injected freely into the cavity of the uterus, by means of a syringe. After a few minutes the flow was completely stopped, and no more hemorrhage occurred subsequently.

Eventually the mother and the two children, both females, did well, and continue yet (Nov. 11th) in good health.

Remarks.—As is seen, I think this case presents some interesting features. In the first place, the spontaneous version, which, although it is apt to take place, is, nevertheless, of unusual occurrence. In examining the literature of the subject, I find that few, very few, cases are recorded in which a complete spontaneous version occurred when either the breech or the head was presenting. With regard to the precise mechanism of spontaneous version, nothing is definitely known. No one, as far as I have been able to find out, has given an accurate explanation of this curious phenomenon. Cazeaux thought it is produced by partial or irregular contraction of the womb, one side of it contracting more powerfully than the other, or the latter being apt to remain entirely inert. In my case, certainly, the uterine contractions were irregular, I having to resort to the use of ergot and manual pressure to induce them and endeavor to increase their strength. I also observed that while the right side of the uterus was active, when the contractions were present, the left was almost powerless. A very interesting case is reported by Geneuil (Ann. de Gynécologie, Vol. v, 1876), quoted by Playfair, ("System of Midwifery," page 314, 1878), in which Geneuil was present during spontaneous version, in the course of which the breech was substituted for the left shoulder more than four hours after the rupture of the membranes. Here the uterus was so firmly contracted that the phenomenon of version was impossible. He observed that the side of the womb opposite the head of the child was contracting energetically, while the other side remained flaccid; but eventually the case terminated without assistance, the presenting part being the breech. In the present instance a pelvic presentation, that of the feet, was substituted by the first position of the vertex, the phenomenon taking place about half an hour after the rupture of the membranes, the birth ending without any great assistance.

With regard to the treatment of the asphyxiated child, I chiefly relied on Silvester's method of artificial respiration, although the application, for a few moments, of alternate douches of warm and cold water were employed to induce reflex respiratory movements. This measure, which, I have no doubt, is in many cases of paramount importance, is not, nevertheless, entirely divested of its dangers. I think that the application of heat and cold to the chest, if long continued, may subsequently produce inflammation of the lungs, or of their investing membrane. We cannot be too careful in the employment of these two agents, even when they are imperatively demanded.

The post-partum hemorrhage was successfully stopped by the local use of vinegar. This agent, so greatly recommended by Prof. Penrose, of the University of Pennsylvania, is destitute of *all* danger. According to this skilled and experienced obstetrician, it is the remedy *par excellence* in post-partum hemorrhage, easily obtained anywhere, while it costs comparatively nothing. Country practitioners, especially, should think of this. The vinegar can be applied by means of a syringe, as in my case, or, as Dr. Penrose recommends, by dipping a rag into a solution of the remedy, which is then taken into the cavity of the uterus and wrung there. In either case the intra-uterine application is followed by a complete stoppage of the sanguineous flow. Dr. Penrose says that since he has been using this excellent agent he has never met with a single case of post-partum hemorrhage, from whatever cause, in which it has failed to produce the desired effects. He says it is convenient, efficient, safe, cleanly and antiseptic. (See his

paper on the subject, and the discussion, in the *Transactions* of the American Gynæcological Society, for 1878.) In my case I have no doubt it prevented a fatal issue.

Medical Societies.

NORTHERN MEDICAL SOCIETY OF PHILADELPHIA.

Dr. Jas. Collins introduced the subject of

Abscess in the Region of the Rectum.

In the course of his remarks, he reported three cases presenting the peculiarity of having a large mass of exudation surrounding the fistulous tracts. In two of the cases this mass had been diagnosed by good surgeons as scirrhus. In each of the cases he removed the mass entire, exposing the muscular fibre of the glutei and sphincter muscles with the periosteum of the coccyx. The sphincter was not divided.

The wound healed kindly, and there has been no return of the trouble. The masses, after removal, were examined with the microscope, and pronounced not cancerous, simply exudation.

Dr. Hall called attention to two points in the remarks of Dr. Collins, viz.: Anal fistula has its origin in an abscess exterior to the bowel; and the treatment without division of the sphincter muscle. He believed both these to be contrary to the teachings of many authors, and asked the opinion of the members upon these points.

Dr. H. Rihl said he was always surprised at the large amount of pus that formed in this region without much distress. He related a case in which the fistula was apparently the result of the use of a catheter. The patient had been using the catheter upon himself for a long time, when he saw pus could be forced out through the urethra by pressing in the rectal fossa.

Dr. W. M. Welsh related a case of fistula associated with phthisis, in which tenesmus was the only symptom for several days; then there was slight pain in the region of the anus. Upon opening the abscess, there was a very large discharge of pus, mixed with fecal matter. A very large slough separated, and a little later the whole region became gangrenous. The patient was confined to bed before the commencement of this abscess, and died from the disease in the lung not long after. He did not see any treatment possible in such a case, beyond palliation.

Dr. N. Hatfield had seen many cases of ischiorectal abscess, most of them resulting in a complete fistula. Those with a syphilitic history had an infiltrated mass, like those described by Dr. Collins. He thought the question of operation for anal fistula, when the patient has phthisis, an important one, and asked the opinion of those present. He did not believe in the derivative action of the discharge from the fistula, as given by some of the older surgeons; therefore, he operated upon all cases when he saw them early. After cavities had formed in the lungs, he thought treatment, beyond palliation, to be useless. His method of operating depended upon the internal opening; when that was low down, he cut the sphincter; when high up, he enlarged the external opening and packed the wound.

Dr. Collins replied that his first case had a history of syphilis, and was given thirty grains potassium iodide three times daily. In the other cases he elicited no such history, and, therefore, treated them with simple tonics.

Dr. E. E. Montgomery believed that these abscesses originate in the cellular tissue, and burst into the gut. He had seen one case which had undoubtedly begun in a false passage made by the urethral catheter. In treatment he believed that stretching the sphincter had the same effect as dividing it.

Dr. W. S. Janney. From the account Dr. Collins has given of his cases, he had no doubt that they were syphilitic; all that he had seen with such infiltration had been so. He believed that fistulæ begin in an abscess outside the gut, and burst both ways. He endorsed the treatment of Dr. Collins. Several years ago he operated upon six or eight cases of fistula in phthisical subjects, with an unfavorable result in every case. There is a popular idea that the discharge from the fistula relieves the lung, which agrees with the report his patients made of themselves. The abscess itself is often of a tuberculous nature. Not long ago he removed a tumor from the neck of a young girl, which, after removal, was pronounced to be tubercular. There was no history of phthisis, nor any lung trouble at the time. Six months later she died of lung disease, which the family associated with the operation.

Dr. E. R. Stone had treated one case having a scirrhus mass in the rectum, with seven fistulous openings near the anus. He simply dilated the stricture in the rectum and the fistulæ all closed. He had seen one case treated with the elastic ligature; he thought the suffering was, at least, a hundred times that caused by the knife.

Dr. C. Wittig said the disease, like piles, depended upon a want of aeration of the blood in the lungs, and a checking of the circulation through the liver. The treatment should be directed to the restoration of the proper function in these organs.

Dr. Collins was strongly in favor of operating in all cases, because of the danger of septicæmia. He believed that in phthisical patients death was more frequently the result of the absorption of septic material from abscesses than from exhaustion.

The Southeast Missouri Medical Society

Met at Cape Girardeau, November 4th, Dr. A. E. Simpson, President, in the chair. There was a full attendance, and a number of papers were presented. A resolution was passed endorsing those colleges which have made a three-year course requisite to graduation, and the following was also—

Resolved, That no member of this Association should receive any student unless said student first pledges himself not to enter any medical college in the United States except those requiring a preliminary examination and a three-year course of graded instruction.

EDITORIAL DEPARTMENT.

PERISCOPE.

The Value of Calomel in the Zymotic Diseases of Infancy.

Dr. E. M. Boddy expresses his views as follows, in the *Medical Press and Circular*, October 8th:—

I shall make a few remarks on the advisability of administering calomel in diseases which are specially *peculiar* to infancy, such as scarlet fever, measles, and others of a zymotic type.

In all the zymotic or exanthematous fevers, there is the accompanying eruption or rash, as it is usually called, which, when it has thoroughly exhausted itself, or in other words, when it has finally disappeared, and the desquamation of the cuticle has commenced, then is the time to direct our attention to the alimentary canal, for we shall invariably find after, as well as during the attack, that the alvine excreta are in a most filthy and unhealthy condition, in fact, almost approaching a poisonous character, and, as some believe, contain an element highly infectious to the last degree, and especially when the patient is suffering from typhoid fever. Regarding these infectious, or non-infectious characteristics, I have nothing to do; but, parenthetically, I may say, they develop gases, exceedingly offensive and injurious if inadvertently inhaled; they must, therefore, be extremely detrimental to the recovery of the sufferer, for if they are poisonous when ejected or exposed to atmospheric influences, what must they be when allowed to remain in the intestines, pent up in a confined space, with the mucous membrane absorbing the impurities resulting from the effects of the fever, besides the impure liquid portion of the fæces; what must be the result, I say—a protracted recovery, or a certain death?

Therefore, it behooves us, immediately on the disappearance of the rash, to administer purgatives till we have eliminated the fever poison which has been germinating and stagnating in the fecal contents of the intestinal canal, and the only purgative which is at all capable of thoroughly cleansing out the intestines is calomel; for, owing to its dual properties, it not only purges the patient, but by virtue of its chologogic action, it cleanses out the human cesspool, viz.: the liver, which, in all fevers, is a reservoir for everything impure and unhealthy.

If we do not pursue this course, the inevitable result is diarrhœa, which, instead of being regarded as a good omen, as indicating that nature requires assistance, and that she is trying to accommodate herself to the force of circumstances, we go diametrically opposite to her, and regard the efforts of nature as significant of approaching evil; and so we resort *instanter* to astringents, and if that is not sufficient (and it very seldom is), we inject up the rectum certain astringent compounds, which is as unscientific as the insertion of a cork would be; we know, or can guess the result—the child dies, presumably from the fever, though I cannot help thinking that the child succumbs to the deleterious action of the astringents.

Pharmaceutical Use of Gelatine.

Gelatine, according to the editor of the *Pharmaceutical Journal*, is not suitable as a vehicle for tannin in pessaries or suppositories. A decomposition occurs, with the formation of tannate of gelatine, and the otherwise gelatinous vehicle breaks down in the preparation. In those instances where medical men require a gelatine vehicle, it would be better that they left the most suitable relative proportions of the ingredients for that vehicle to the dispenser. It is usual to keep a gelatine medium ready prepared, in proper proportions; and on liquefying this for the addition of the medicament, the pessaries are moulded in the usual manner. The usual vehicles for pessaries and suppositories are cacao butter, or some such substance, as a basis, on the one hand, and gelatine on the other; and it will be better for the prescriber to specify one or other of these, leaving the relative proportions to the dispenser, the writer of the prescription proportioning only the medicament. Very rarely do medical men give suitable proportions for the vehicle desired. The same may be said of pill masses. A dispenser is often at his wits' end in too literally interpreting the excipient and its quantity ordered in a prescription. The ingredients being written, those minor details—in fact, the mode of combining those ingredients so as to form a pill mass—may well be left to the practical experience of the dispenser.

Ipecac. in Dysentery.

Of this treatment Dr. A. A. Woodhull says, in the *Western Lancet*, October—

There are a few conditions to be observed, and then the practice is simple, and in nine cases out of ten successful. In my own moderate experience I have never known it to fail. The conditions are: 1. A pure drug. There is much adulterated ipecacuanha in the market, where harsh and irritant emetics are mixed with or substituted for the true root. The best security for the character of the powder is the character of the druggist. 2. Administer it on an empty stomach, either first giving an intentional emetic, or let the patient fast at least four hours. Fasting is not always successful, for a weakened stomach will often contain undigested substances for a longer period, and then the first dose will act emetically. 3. Give simultaneously, or a few minutes before, from ten to fifteen minims of laudanum, or a proportional quantity of paregoric, and a few minutes afterward apply a mild sinapism or a coating of tincture of iodine to the epigastrium. 4. Give the medicine in pill form, or, better, in the least possible amount of water, with a few drops of some aromatic, to disguise the taste. With care twenty grains may be suspended in two fluid-drachms of water. 5. Insist

upon recumbent rest and abstinence from all food or drink for four or six hours. The first dose may be rejected, in which case repeat as soon as the stomach is quiet. From fifteen to forty or more grains may be given at a dose, but twenty or twenty-five is the proper size in a moderately severe case. It may be repeated in four, six or eight hours, according to circumstances. It is the exception not to have decided relief after the second dose,and the more ill the patient is the better is the medicine, especially in very large doses, tolerated. The name of the drug should not be made known, in order to avoid the moral effect following the popular notion that ipecac is necessarily emetic. It will be observed that this treatment is essentially non-emetic, although should vomiting occur once or twice no harm would be done. For my own part I look upon dysentery as more surely and more promptly checked by ipecacuanha than are the malarial fevers by quinine. Scorbutic dysentery alone may be an exception.

Acute Poisoning from Ergot.

This drug is given so freely that much interest attaches to the following case, reported in the London *Medical Times and Gazette*, from St. Mary's Hospital, London:—

Mrs. W., aged forty-eight years, a stout, healthy looking woman, was admitted on October 21st, 1878. She had been married twice, first at the age of seventeen, afterward at the age of forty. She had two children by the first marriage, but none subsequently, and her last pregnancy was twenty years ago.

Eight years before admission here she was under the treatment of Dr. Meadows, at Soho Hospital, for fibroid tumor of the uterus. During that time she took ergot twice. The first time it affected her severely; but on the second administration it failed to act on the uterus at all. She was in Soho Hospital at that time for three months, and left cured. In March, 1878, she came to St. Mary's, suffering from menorrhagia, and was examined by Dr. Meadows, who detected a growth in the uterus. She was subsequently admitted in October; and on the 23d of that month, patient being under the influence of chloroform, a fibro-cystic polypus was removed from the anterior wall of the uterus.

On October 31st, pulv. ergotæ, ℥ ss, was ordered, with the view of bringing down any shreds of growth which might remain. The effects of this drug were very marked, as in ten minutes powerful uterine contractions were set up, and continued for two hours, when, on vaginal examination, a large tumor, of the size of an orange, was found presenting. In addition to the very strong uterine action, there was marked depression, and she complained of severe nausea and headache. The face was deeply flushed, and the eyelids were swollen, the right one especially. The left arm and hand were greatly increased in size—so much so, that a ring she wore on her finger was completely hidden. The pulse, usually rather weak, was scarcely perceptible at the wrist, the artery being quite soft. The rate of the heart's action was not much influenced, but was slightly hurried. The swelling of the arm and hand did not disappear until the next day, when she was in all respects well. Dr. Meadows removed the tumor (which was attached to the fundus by a narrow pedicle) by means of the écraseur.

November 7th. Ergot was given again, as it was found that another tumor was present. As one dose did not act at first, it was repeated in six hours, and the symptoms already noted appeared again, but in an exaggerated form. The pain was so intense that she was ordered a hypodermic injection of one-fourth of a grain of morphia, with the result of easing pain and checking uterine action. The tumor presented, but as operation was not then convenient it was not removed, and gradually receded.

On November 24th ergot was again given; but three half-drachm doses, administered at intervals of six hours, produced no effect beyond the swelling of the face and arms, depression and nausea. Patient was then unsuccessfully galvanized, with the view of stimulating the uterus to contract and expel the growth.

Experiments with Diuretics.

Dr. Maurel, a naval surgeon, communicated a paper to the Société de Thérapeutique (*Jour. de Thérap.*, September 10), giving an account of a number of careful experiments which he had performed upon healthy individuals, in order to ascertain and compare the effects of various reputed diuretics. His general conclusion is that the practitioner can rely only on three of the diuretics among those which have been under investigation, viz., chlorate of potash, salicylate of soda, and digitalis, the first two even of these having but a feeble activity. The other medicinal substances reputed as diuretics—nitrate and acetate of potash, iodide of potassium, squill, and colchicum—are either devoid of action or produce effects of no importance. The reporter, commenting upon this conclusion, observes that he cannot agree with it, having no doubt that nitrate and acetate of potash and squill are energetic diuretics, from what he has observed when they have been employed in suitable cases. The indication for their employment is the point of importance. If, in place of experimenting upon healthy men, Dr. Maurel had given some of these diuretics, which he accuses of inertia, to subjects infiltrated with serosity, and having abundant collections of water (collections whence the circulation might largely draw to produce abundant diuresis), he would have been less positive in his conclusions, and would have admitted that these substances are excellent diuretics in certain cases of dropsy, when there are no hyperæmic or inflammatory lesions of the kidneys. The reporter terminates with a remark which is often lost sight of by those who are content to draw their conclusions solely from experiments on healthy men and animals. If, he observes, the study of medicinal agents, etc., on healthy men has its great value, it does not suffice for the establishment of a complete measure of their therapeutical power. It is still essentially necessary that clinical observation should intervene in order to obtain a complete history of these substances.

Alkalies and Acids in Treatment of Rheumatism.

Dr. F. M. Garlic writes, to the *Michigan Medical News*—

The clinical history of rheumatism is not completely known, and as yet we have no true criterion by which to determine the therapeutic effects of medicine upon this disease. Our treatment is based upon individual experience, and often in seeking new remedies we overlook that which is really meritorious. I have used salicylic acid and salicylate of soda in the treatment of rheumatic fever, but failed to get as good results as with bicarbonate of soda and potassa, which I esteem highly as therapeutic agents in the treatment of this disease.

The combination of these agents with a solution of citric acid or lemon juice, makes a very agreeable effervesceent drink. I have treated several cases of acute rheumatism with these remedies, and always with good results. The following case will best illustrate my general plan of treatment: Mrs. E. A., aged twenty-seven years; first visit March 11th, 1877; pulse 100, temperature 103½, tongue very much coated, urine scanty, bowels constipated, wrist, shoulder and ankle of left side swollen, red, sensitive to touch or motion, and very painful. I prescribed as follows:—

℞. Bicarbonate of potassa, ℥j
Bicarbonate of soda, ℥vj. M.

Divide into 15 parts and put up in blue papers.

Citric acid, ℥ss.

Divide into 15 parts and put up in white papers.

Sig.—Dissolve one of each kind in one-third tumbler of water, mix and drink while effervescing.

℞. Fl. ext. aconite, gtt.xx
Water, ℥iv. M.

Sig.—Teaspoonful every hour.

March 13th. Patient quite easy; continued effervescing powders; discontinued aconite; prescribed two grains of quinine ever four hours, alternating with effervescent powders. March 16th. Patient convalescent; continued effervescent powders once in six hours, alternating with quinine. March 20th. Patient quite well, and at work.

I have followed this treatment in quite a number of cases, and with good results. I sometimes have to treat complications, but place my reliance on the potassa and soda as general remedies in this disease.

Syphilis in Old Age.

The Boston *Medical and Surgical Journal*, in a review of recent syphilology, states that, contrary to the general belief, Dr. Sigmund, of Vienna, regards syphilis acquired late in life as of special mildness. He has made one hundred and eighteen observations of such cases, in men of over forty-five, and in women of over forty-five years of age. The period of incubation is longer than in young people, three to six weeks being required for the sclerosis of the initial lesion and the corresponding adenitis. The characteristic manifestations of ulterior stages were also delayed, as to their appearance, to a period much later than is common in the syphilis of young life. Early secondary eruptions were usually slight and superficial, tubercular or deep exudative formations were rare. They appeared also without fever, and though often with vertigo, insomnia, and cephalalgia, never with an epileptic attack. Generally, he thinks, the hair and the nails did not seem influenced by the disease. There was no caries of the nasal bones, of the jaw, or of the laryngeal cartilages. People already enfeebled sometimes showed profound disturbances of nutrition, and three cases were of grave prognosis. In forty per cent., after adenitis and roseola no further symptom was developed. It was only where severe symptoms appeared that anti-syphilitic medication, properly so called, was used. Otherwise Sigmund made hygiene the basis of his treatment of these cases. In about half the cases local applications alone were employed, in the other half mercurials internally and externally. Twenty-one patients showed general amelioration, without perfect cure.

Reviews and Book Notices.

Notes on Current Medical Literature.

——Our Exchanges.

Littell's Living Age. There is none more welcome, and none more regular on our list of exchanges. We never open its pages without a certainty of finding the choicest and best selected articles on the various literary topics of the day. If a family can take but one of the various and charming magazines of the times, let that one be *Littell's Living Age.* It is a library in itself, treating on scientific, critical, biographical and political subjects, in the most admirable manner, at the same time that it presents the most charming stories and choicest poetry. As a weekly periodical, it is a marvel of cheapness.

The Agriculturist; price $1.50 a year, and worth that alone for its engravings. Every year it improves in style and appearance, and we should think it invaluable to the farmer and gardener.

The Germantown Telegraph. The best family newspaper in these parts, if not in the country. Not a farmer's family that can get it should be without it. Its selections of serial stories are always of a high order, perfectly pure in thought and language; just such as one would read aloud to wife, sisters and daughters.

The Vermont Chronicle is another family paper, of a high order. Especially suited, in its agricultural articles, for the more northern States, we

would commend it as a high-toned literary newspaper, interesting alike to the old and young.

The Cincinnati Gazette (weekly). We always welcome it as a western friend, and would commend it, as a family paper, to all who have western interests and associations.

The Trenton Gazette. A good local paper, always welcome on our table.

The Independent. An ably edited and always interesting weekly. We would call especial attention to its coming winter numbers, as containing Rev. Joseph Cook's valuable lectures. They will be esteemed, by many, worth the subscription of the paper.

The Evangelist is a regular and welcome visitor, and stands among the first and best of religious newspapers.

The Presbyterian Banner, of Pittsburgh, and *The Presbyterian*, of Philadelphia, are especially excellent denominational religious papers. Also *The Christian Advocate* and *Zion's Herald*, which are regular, well edited, and always welcome. P.

——The *Proceedings* of the Association of Medical Officers of American Institutions for Idiotic and Feeble Minded Persons, at the annual sessions of 1878, 1879, fill a pamphlet of 108 pages. Besides the minutes, the volume contains the following papers: Intemperance as a Cause of Idiocy, by Dr. G. E. Shuttleworth; on Temporary Loss of Speech from Shock, by Dr. F. Beach; Offspring of First Cousins, by Mrs. C. W. Brown; Recent Progress in the Training of Idiots, by Dr. Seguin; the Relation of Speech or Language to Idiocy, by Dr. H. B. Wilbur; on Internal Hydrocephalus, by Dr. H. M. Knight; and Juvenile Insanity, by Dr. I. N. Kerlin. (J. B. Lippincott & Co., Philadelphia.)

BOOK NOTICES.

A Ministry of Health, and other Addresses. By Benjamin W. Richardson, M.D., F.R.S., LL.D., F.S.A., etc. pp. 354. New York, D. Appleton & Co.

This is a collection of Dr. Richardson's addresses, nine in all, which, in the last few years, he has delivered on various public occasions. They are on the following topics: the necessity, in a civilized nation, of having a cabinet minister to look after the public health; a biographical sketch of William Harvey; the relations of the medical to the clerical profession; the influence of study on health; the element of vitality in nations and individuals; the influence of medical men in social and political life; the various methods of disposing of dead bodies; the value of a registration of disease; a sketch of ether drinking in Ireland. These are, indeed, not the titles he gives his addresses; his titles are mostly too epigrammatic to give the reader much notion of his topic (*e.g.*, "A Homily, Clerico-Medical"); or to indicate what his themes are. It is needless to say they are handled with large learning and masterly eloquence; all who have read much of Dr. Richardson's writing will know this; but it is not amiss to warn the younger reader that the author is an enthusiast, who is sometimes carried away by the fervor of his feelings, and his devotion to his ideas, to an extent that mars the precision, or, perhaps, we should rather say, the completeness of his statements. He is an advocate, an able and impassioned one, and must be heard as such, rather than as a judicial interpreter of science.

First Lines of Therapeutics, as based on the Modes and Processes of Healing, as occurring spontaneously in Disease; and on the Modes and Processes of Dying, as resulting naturally from Disease. By Alexander Harvey, M.A., M.D., Emeritus Professor of Materia Medica in the University of Aberdeen, etc. 1 volume, 8vo, pp. 278. D. Appleton & Co.

A few years ago we had occasion, in speaking of a lecture by an eminent Canadian physician, to ask the attention of the profession to a thoughtful essay by John Stuart Mill, one of those first published after his death, in which that deep thinker points out the prevailing abuse of the words *nature* and *natural* in modern semi-scientific writing. Would that Dr. Harvey had read that essay before he wrote this book! He always spells Nature with a big N, and sets it over against Art with a big A, as if these *nomina* were as real as the mediæval schoolmen taught. He bewails (page 176) that others are "misled and cheated by words." Has he been on his guard against this himself? We think not.

His book is a straight-out apotheosis of the *vis medicatrix naturæ*. This *vis* has many backers now-a-days; but is it wise, is it correct, to contrast it with art? What Dr. Harvey calls "the first and leading fact in therapeutics" is this: "The living organism is so constituted as to be itself adequate to the Cure of all those diseased states that are in their own nature curable." What is this but the barrenest tautology? Mind, he does not mean that all these curable diseases get cured; he merely means that the cures are

effected through organic processes. He denies wholly to drugs any "specific curative powers;" says they never "operate in a direct counteractive way, but only through the curative powers of the organism." This is fighting windmills. Nobody supposes that drugs expel disease as the exorcist expels a demon; but in antiseptic medicine the drug which destroys a bacillus (if any does) removes the disease, and this is counteractive in the right sense of the word.

His lecture on health and disease as relative states of one living organism is marked by a similar playing with words. He announces it as a discovery that "both of them are *natural* conditions of the organism" (italics his). "Strange it is," he adds, "that a matter so simple should not be seen at once by all" (pages 172–3). Stranger still it seems to us that this learned author cannot see that Art (with a big A), which he flouts so often, stands in no such contradiction to Nature as he thinks. Had he ever read, and pondered on, and understood those wonderful words of Goethe: *Das Widernatürlichste ist doch Natur*, he would not have fallen into these fallacies.

Of course, with these notions to teach, active therapeusis is with him a thing of the past. "Now," he says, magisterially, "now that the reign of the lancet, of calomel and active purgation is at an end," the *vis medicatrix naturæ* is the ruling law of practice. He allows that he will be looked upon as a "Therapeutic Nihilist;" but while he denies the charge, his doctrines result in it.

These strictures on the book are demanded by the prevalence of the errors it teaches, by the *idola fori* which it sets up, by the sophisms of the school that it represents; but we must not part company with Dr. Harvey without adding that he is a man of culture, and commanding a pleasing style, and incidentally imparting many valuable suggestions.

A Biographical Dictionary of Contemporary American Physicians and Surgeons. Edited by William B. Atkinson, M.D., etc. Second edition. 1 vol. pp. 749, 1879. Price, cloth, $5.00; leather, $6.00. Published by D. G. Brinton, 115 South 7th Street, Philadelphia.

The value of contemporary biography, especially when the facts set forth are carefully authenticated, is appreciated by all students of history. What would we not give for such a work as this drawn up, we will say, in the days of Queen Elizabeth, supplying us with trustworthy data of the notables of that epoch so marvelously rich in master minds! We are apt to underestimate the worth of such undertakings when they concern our own times. It was an old saying nineteen hundred years ago, that prophets have little honor in their own country; and it is true of others than prophets.

The compiler and publisher of the work before us state their intention to be to make it a biographical encyclopædia of "all who have visibly and publicly contributed to the advancement of medical science in the United States during the present generation," whether as authors, writers for periodical literature, teachers, inventors of surgical apparatus, discoverers of medical facts, and occupants of official medical positions, or as influential practitioners. The number is necessarily great, and it is not a matter of surprise to find nearly or quite twenty-eight hundred names already in the volume; and it is intended to extend this number to embrace all who have been omitted by oversight or from the difficulty of obtaining the requisite information, until the volume "shall be a complete account of the activity and research displayed by the regular profession of this generation in this country." This will be done by adding a signature to the book from time to time, as material is collected, the arrangement being such as to allow this conveniently.

The interest of the work is primarily, of course, to physicians; through its pages they can acquaint themselves, as by no other means, with the histories and life labors of their professional brethren. But the character of the volume will not confine it to professional readers. As a work of reference, as a history of the times dealing with a prominent profession, as a storehouse of biographical, genealogical and social data, it must have a place in every library pretending to completeness, private or public, on every editor's shelf, in every collection of works of reference.

As in most instances the facts have been obtained from the subject of the sketch himself, or from some of his personal friends, they can be relied upon as correct; and the labor of the editor has been confined to arranging them in the form adopted for their publication. Considering the delicate nature of his task, and the quantity of material submitted, he has certainly acquitted himself in a manner very satisfactory to the reader.

The manufacture of the volume is of the best; fine, tinted paper, careful presswork, and excellent binding go to confer upon it the character of a production of the highest class. Specimen pages are offered by the publisher to all who desire to get an idea of the work before purchasing.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	**$5.00**
Half-Yearly Compendium of Med. Science,	**2.50**
Reporter and Compendium, - - -	**7.00**
Physician's Daily Pocket Record, - -	**1.50**
Reporter and Pocket Record, - - -	**6.25**
Reporter, Comp. and Pocket Record, - -	**8.25**

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,
115 South Seventh Street,
PHILADELPHIA, PA.

THE DOCTRINE OF EUTHANASIA.

To the philosophical observer of the mental changes which have in modern times taken place in the human race, perhaps none is more striking than the vastly increased value set upon human life. It is not many centuries since all the European States compounded murder for blood money; in England a slain serf was paid for in full with twenty shillings, and in France for a less sum. Within the recollection of men yet living a man who stole a pair of shoes might be hanged for it in that same enlightened country.

So much has all this changed that capital punishment is now very rare in Great Britain, and it is almost unknown in France and Italy. War used to be carried on with indiscriminate slaughter, while at present non-combatants are spared, the wounded enemy cared for, and the philanthropist follows close on the soldier. Few objects have enlisted more earnestly the efforts of the charitable than foundling hospitals and incurable wards, where lives that would otherwise almost certainly perish quickly are maintained with the warmest solicitude.

Is this anxiety founded on sympathy and charity, or is it prompted by a secret, unconscious fear that the life we have is the only one we shall get? There are advocates for each view, but we shall leave their discussion of it in order to pass to one of the features of the subject which interests medical men. This is the doctrine of Euthanasia; in other words, the propriety, in certain extreme cases, of shortening the life of patients.

The matter came up for discussion at the last meeting of the South Carolina Medical Association, and elicited different opinions. Supposing that, by all precedent experience, death is certain, and that its antecedent agonies are long and terrible, is it justifiable to shorten the life of the patient? That is the question. Speaking for a committee that had been appointed to report on the subject in its various aspects, Dr. J. F. M. GEDDINGS stated that, morally, humanity might be entitled to the same mercy accorded the brute creation, and have its death artificially hastened to relieve it from an agony which could only end in dissolution; yet should the door be opened to such practice, it would lead to manifold horrible abuses. In its ethical aspect, the committee were met with similar difficulties. They could not report as ethical that which is contrary to the uses of society, the laws of which forbid the taking of human life. In its religious aspect the committee had felt hardly competent to consider the subject at all.

Taking religious views of the matter, Euthanasia, in the sense contemplated, would necessarily be rejected, partly because it was contrary to the generally received opinion that a certain amount of suffering was the Divine decree. The greatest difficulty, however, was encountered in the legal aspects of the subject. According to all codes of civilized men, the law was distinct and clear, "thou shalt not kill." In the present state of society the practice of Euthanasia is illegal, and could only be regarded as the practice of murder. He did not condemn the further investigation of the subject, however,

and thought it would be well to continue its consideration from year to year, when finally a written report, which was not deemed at present to be expedient, could be prepared. Until there was a change in the laws and in society, there would be no possibility of making recommendations upon the practice of Euthanasia.

This moderately conservative report was not quite welcome to either party in the meeting. On what we might call the "extreme left," Dr. T. T. Robertson maintained that the time had come when scientific men should discuss this and similar questions regardless of theologians. Euthanasia was as sure to be accepted as was the doctrine of evolution, and that would be, as surely as the Copernican system in astronomy. Society was not prepared for it as yet, but the time had come to discuss the question as to whether physicians are ever justified in shortening life. He believed they were, and was sure the scientific world would sooner or later come to it. He himself had practiced it. He knew it would shock some and antagonize the theologians. But he was prepared to resort to it again under like circumstances.

Such sentiments promptly brought the "extreme right" to their feet. Dr. Prioleau did not consider it expedient to discuss the question. The community is not now prepared for it. Dr. Buist thought the public should not be enlightened on this subject. He hoped that nothing of the discussion would be published, as it might give rise to wrong opinions.

As the Association concluded that it had nothing to conceal, and had not committed itself to any very startling heresy, this suggestion was not accepted; and we are indebted to its courage, which we applaud, for the entertaining discussion we have referred to.

An essential preliminary, it seems to us, to the fruitful debate of this question, would be to define precisely such hypothetical cases as would allow Euthanasia in the mind of its advocates; and then to proceed to inquire whether there are actually cases which correspond to such hypothetical ones. Does hydrophobia? Does cancer? Does the third stage of phthisis? Yet in all these alleged cures have been recorded. They hardly answer the requirements. But if they do not, what diseases do?

THE DECAY OF THE EMOTIONS.

In reading history, one cannot but be struck with the decay of the emotions which has taken place in the last few centuries, say since the rise of national literatures. Men do not love or fear, hate or enjoy, with the violence they once did. The whole tone of modern life is against such emotional excess. We see in this age the charge of the Light Brigade through a valley raked by cannon shot; but the individual soldier is seized by no such fury as the *Berserkerwuth* of the Northmen. Men pursue their purposes with no less tenacity, and with undiminished unscrupulousness, but the passion of revenge, which played such a prominent part in the days of yore, is now next to obsolete. In the autobiography of Benvenuto Cellini, that great artist informs us that after an insult he was seized with a sort of fever or delirium, which could not be appeased until he had wreaked his resentment.

Many instances are on record of persons dying outright from grief, or joy, or disappointment, while now-a-days such occurrences are extremely rare. Several such are recorded in the *Memoires* of the Marechal de Vielleville, a leading French General of the Sixteenth century. On one occasion he had surprised and captured a young Spaniard who had charge of an outlying post. It was under circumstances of a nature to entail severe censure on the captive, for carelessness. Although unhurt and in good health, he died, of mere grief, the first night of his captivity. Examples are not rare where a courtier forbidden the royal presence presently died of mortification. They seemed less able to hold out against moral reverses than now.

It is evident that to-day men are less apt to act on impulse than formerly. They weigh and ponder more. This powerfully affects their viability, and is unquestionably an important factor in the longer lives that modern generations have. With this comes a much greater tolerance of disease and of unhealthy surroundings. Less easily

depressed, with more hope and better grounds for it, they do not yield to the depressing and often fatal effects of fear and despair.

Evidently, therefore, the decay of the emotions is a hygienic advantage. It means the increased power of the intellectual elements of mind. It is a sign of progress, and as closely associated with g eater tenacity of life, is one which the physician should foster. In marked neurotic temperaments the control of the emotion is the most difficult lesson to learn, but is essential to safety. Self-government is not attained until the actions are guided by thought rather than impulse; and the improvement of the individual or the race is conditioned on personal self government.

Notes and Comments.

Therapeutical Notes.

SALICYLIC ACID IN LUPUS.

An Italian physician, Dr. Ameglio, treats lupus by administering arsenic internally, and painting the part with—

℞.	Acidi salicylici,	ʒ vj	
	Glycerinæ,	ʒ ijss.	M.

The results he reports are that in a few days the readily bleeding vegetations were withered, the ulcerating surface dried and assumed a good character, and complete cicatrization had occurred in one month.

A PROPHYLACTIC IN MALARIA.

The best prophylactic which Dr. Q. C. Smith has found (Pacific *Medical and Surgical Journal*, Oct.) is the following:—

℞.	Pulv. cinchonæ,		
	Potassii iodidi,	āā	ʒ j
	Pulv. ipecac.		ʒ j
	Spiritus frumenti,		Oj. M.

Sig.—A tablespoonful three times a day, after meals.

He says of it that it is a preparation the knowledge of which is certainly well worthy of being perpetuated, as it is certainly very efficacious for the purpose for which it is recommended.

MAIZE STIGMAS IN URINARY DISEASE.

Broom corn tops are familiar as the agent in domestic infusions for urinary disorders; and recently the stigmas of ordinary maize have been highly recommended by Dr. H. Dassein as a reliable remedy for complaints of the kidneys and bladder, inflammation of the gall bladder, and various diseases of the urinary organs. The author used an extract made from the stigmas. The virtues of this extract merit further investigation.

APPLICATIONS FOR BURNS AND SCALDS.

The following application is quoted from German sources, in the *American Journal of Pharmacy*:—

℞.	Iodoformi,	ʒ ij	
	Extracti conii,	ʒ j	
	Acidi carbolici,	gtt. x	
	Unguenti aquæ rosæ,	ʒ j.	M.

Sig.—Spread on lint, and apply to the parts twice daily.

Dr. R. E. Howard (*Medical Herald*, Nov.) recommends a *saturated solution of sulphate of magnesia*, applied on lint, and small doses of it internally. In a severe burn from concentrated lye, he says he never saw a remedy act more promptly and satisfactorily.

Rusty Weapons Refurbished.

For years, in England, the advocates of the extension of venereal disease—we mean the opponents of the Contagious Diseases Acts—have reiterated that the Acts must not, cannot be enforced, except in garrison towns; and now the New York *Medical Record* takes up this rusty weapon and brandishes it anew. It accuses the Reporter of ignorance of these Acts, even to suggest such a thing. In point of fact, with very slight alteration the effective parts of these Acts could be introduced into any American city to day, without interfering with the constitutional right of citizens. We have no doubt the *Record* knows this, but as it cannot deny the excellent results of the Acts, and is presumably too timid to advocate them or any other similar legislation, it has recourse to this avoidance of the issue. We shall, in due time, give attention to the constitutionality of such legislation in this country, about which there was, some time ago, a verbose and labored article in the *Record*, by Dr. Henry M. Lyman, of Chicago.

Failure of Grafts.

The occasional inexplicable failure of grafts is referred to by Mr. John Duncan, Surgeon to the Royal Infirmary, Edinburgh, in a lecture printed in the *British Medical Journal*. The lesion was a burn, situated over the upper part of the abdomen and the lower part of the thorax, in the left mammary line. It was originally more than four inches in diameter, being nearly circular, but at the time of operation had contracted to three inches.

He had attempted to hasten matters by graft-

ing. Several of the grafts took, and were growing well, when, suddenly, one day, without rhyme or reason, they all sloughed, and involved in their destruction a considerable portion of the marginal cicatrix also. "This is an accident," he proceeds to say, "which, in my experience, is not unfrequent. The new grafts, and the epidermic growth which they provoke, are, so to speak, of an exceedingly sensitive character. A very slight digestive disturbance, a little feverishness, as if from a cold in the head, a trivial roughness of manipulation, is enough to destroy them; nay, as in this case, they will occasionally disappear without apparent provocation; and if they do so, the growing epidermis round the circumference of the ulcer invariably sympathizes more or less."

Have a "Hobby."

Such was the advice to his hearers, given by Mr. Sandford, President of the Society of Pharmacy, of London, in a recent address. It is extremely sound advice. Outside of his business or profession, beyond and above the routine work of life, every man should have some pursuit which he follows for the love of it. The greatest and the best men are wont to have such. The man of one idea is next door to the man of no ideas. Be it botany, horticulture, archæology, Greek, theology, or what you will, so that it is far from the daily toil, has nothing to do with the shop, and breaks up the continuity of thought, it will be beneficial, yes, ennobling.

Black Tongue in Children.

Dr. Hirtz, of Strasburg, reports, in the *Gazette Médicale*, of that city, a case of blackness of the tongue in a child of six years, so black that the parents at first thought it was ink stains. The general health was not impaired. It continued a month, and finally yielded to weak washes of corrosive sublimate (1 gr. to water, ℥j). He quotes some other instances of it, and after discussing the etiology of the affection, reaches the conclusion that it is still in doubt whether this discoloration is owing to the presence of a parasitic vegetable growth or to a piliform epithelial hypertrophy.

The Collection of Medicinal Plants.

In the collection of medicinal plants, it is by no means the largest and finest specimens which possess the most active properties. It is well known that although cultivated plants have larger and handsomer leaves than wild ones, their virtues are inferior. This is especially true of plants with narcotic properties. The *American Journal of Pharmacy* very properly criticizes this desire on the part of druggists for elegant specimens. It might go further, and condemn, on the same just grounds, the rage to have all the alkaloids white or nearly so. The bleaching process they are forced to undergo often deteriorates them.

Correspondence.

Lithotomy Operation for Stone in a Female.

Ed. Med. and Surg. Reporter:—

Eight months ago, Dr. B. T. Smith, of Wilmington, Del., was consulted by Mrs. P., a widow woman, aged 38 years, who stated she had been feeling "poorly," more or less, for eight years; had consulted several physicians, both in Wilmington and elsewhere, without relief, and had finally concluded nothing permanent could be done for her, but she only wanted temporary ease. The subjective examination elicited a set of symptoms which made the doctor suspect the bladder to be the seat of trouble, and he desired to make a physical examination, explaining to Mrs. P. why this was necessary. This, however, was repugnant to her, and in default of obtaining her consent the treatment was simply palliative. This principally consisted of anodynes, to allay pain and soothe irritation, and demulcent and diluent drinks, with alkalies. Her symptoms growing worse, pain almost incessant, bladder extremely irritable, etc., she finally consented to an examination, and Dr. Smith, with his partner, Dr. G. R. Henderson, ascertained beyond a doubt, what was previously suspected, viz., stone in the bladder. The medical attendants made the patient understand that the only way to obtain permanent relief was by undergoing an operation. She consented, and on the 13th of the present month (Nov.) it was performed by Drs. Smith and Henderson. Having anæsthetized the patient, she was placed on her back on a hard husk mattress, with the buttocks near the edge of the bed, and the knees sharply flexed. A director was introduced into the bladder, and a straight, probe-pointed bistoury was carried up quite into the viscus, cutting edge toward the pubis. Upon withdrawing the knife, an incision about two lines deep was made through the membranous urethra and the lower half of the neck of the bladder. A pair of short, strong, slightly curved forceps was introduced, and a stone grasped, but the opening was found too small to permit its withdrawal. The knife was again introduced, the opening enlarged, still toward the pubis, and the second introduction of the forceps was more successful, a small stone being in its jaws when withdrawn. This operation was repeated again and again, until *no less than sixteen stones were removed* from the bladder, the largest being an *inch and a quarter* in diameter, and the smallest half an inch in diameter. The stones were of the *oxalic* variety, some of the smallest being of the *hemp seed* shape, and varying in size from a pigeon's egg to that of a Guinea fowl.

The larger stones were round, smooth, and lay in the most dependent part of the bladder; the smaller ones lay well up behind the pubis, and were so impacted together that when the finger was run over them it reminded one of a cobble-stone pavement. Immediately after the operation the bladder was thoroughly washed out with warm water, and an injection of milk, brandy and tincture of opium was administered per rectum. The operation was attended by a very slight hemorrhage; indeed, so slight as to occasion remark. As soon as the patient became conscious, a positive opiate was given her, and a flexible catheter was cut in half, and the end containing the eyelets, to which was attached a long rubber tube, was introduced into the bladder and fixed there, for purposes of cleanliness. On Nov. 15th, two days after the operation, the patient was comfortable. The pulse was 98, skin cool, not much pain, and general condition easy. Opiates were still given, the bowels were kept locked up, and the diet was milk, beef tea, and egg custard. On November 17th the nurse stated that the tube in the bladder had been forced out by a blood clot, but that the patient called for the bed pan when she wanted to use it. And it was a fact that *four days* after the operation the patient could hold *three ounces* of urine in the bladder. This is remarkable, not only for the rapidity with which the parts healed, but because incontinence follows in the majority of cases after this operation. At this date (Thursday, Nov. 20th) the patient is doing well, with every prospect of a speedy and happy recovery.

DRS. SMITH AND HENDERSON.

Infantile Convulsions.

ED. MED. AND SURG. REPORTER:—

In reading your valuable journal, I occasionally see an article upon the subject of infantile convulsions. Allow me to give my experience with the hypodermic method of treatment, by reporting one case which lately came under my care. I was called to attend the six months' old infant of a brother practitioner. He informed me that the child had had two paroxysms, with an hour intervening between the two. After the first fit he gave an enema, hot mustard baths, friction to the spine, potass. brom., gr. v, half hourly, etc., which did not prevent the second paroxysm. Inquiring with regard to the enema, I found the syringe used to have been inadequate for the purpose (a two-ounce glass one). I at once sent for my Davidson's No. 1, and gave an injection of ol. ricini, ℥ j, spts. terebinth, ℥ ij, in one quart of soap suds, which proved effectual in bringing away considerable fecal matter, though, in my opinion, not sufficiently irritating to have produced the convulsions. The paroxysms continued until the fifth, at regular hourly intervals. I at once injected the following solution, hypodermically:—

R.	Hyoscyamine (Merck's),	gr. $\frac{1}{60}$
	Aquæ camph.,	gtt. x.

The child, in course of half an hour, fell into a quiet sleep, which continued for six hours. On awaking it at once commenced nursing, with no further return of the mother's greatest fear, infantile convulsions.

Smith River, Cal. J. F. THORWARTH, M.D.

News and Miscellany.

Method of Preserving Dead Bodies.

Mr. Keysmann, United States Consul General at Berlin, in his dispatch to the Department of State, dated October 30th, communicates a description of a newly discovered process for the preservation of dead bodies. The inventor or discoverer had secured a patent for the process, but the German government, conceiving the high importance of the invention, induced the patentee to abandon his patent. Thereupon the government made public, through the press, a full description of the process, as set forth in letters patent. The following extracts are translated from the German newspapers of Oct. 23d:

The dead bodies of human beings and animals, by this process, fully retain their form, color and flexibility. Even after a period of years such dead bodies may be dissected for purposes of science and criminal jurisprudence. Decay and the offensive smell of decay are completely prevented. Upon incision the muscular flesh shows the same appearance as in the case of a fresh dead body. Preparations made of the several parts, such as natural skeletons, lungs, entrails, etc., retain their softness and pliability.

The liquid used is prepared as follows: In 3000 grams of boiling water are dissolved 100 grams of alum, 25 grams of cooking salt, 12 grams saltpetre, 60 grams potash and 10 grams arsenious acid. The solution is then allowed to cool and filter; to 10 litres of this neutral, colorless, odorless liquid, 4 litres glycerine and one litre methylic alcohol are to be added. The process of preserving or embalming dead bodies by means of this liquid consists, as a rule, in saturating and impregnating the bodies with it. From 1½ to 5 litres of the liquid are used for a body, according to its size.

A California Health Resort.

The Ojai Valley, Ventura Co., Cal., is highly lauded by a writer in the Boston *Medical and Surgical Journal*, November 13th, as a resort for consumptives.

The Ojai Valley is separated from the Pacific Ocean by a mountain ridge, so that there are no direct sea winds. From July to October it is too warm for comfort, for some days, or even weeks, but the nights are delightful. From October to July the weather is said to be perfect. The altitude of the lower Ojai Valley is one thousand feet. The upper valley is about fifteen hundred feet; the mountains five hundred feet higher. The religious and educational advantages are good. A seminary has been recently opened, where any one can be fitted for college. San Buenaventura is the nearest seaport, fifteen miles, over a very good stage road; thence access to San Francisco, by steamer, is easy. Probably there is no place where the patient can safely pass so much time out-of-doors, in the year, as here.

Prophylaxis of Scarlatina and Diphtheria.

Dr. E. M. Snow says, in his last report as City Registrar of Providence—

The occasional occurrence, during the past month, of scarlatina and diphtheria in the same house, and of both diseases, one following the other, in the same child, seem to indicate that the local causes of the two diseases are similar. We may safely say that impure air is one of the factors *necessary* for the propagation of either of the two diseases. We may also say, with positive certainty, that there is very much less danger of either scarlatina or diphtheria in those houses where the premises, and especially the sleeping rooms of the children are free from the impure air arising from sink drains, cesspools and privy vaults. This fact, of which I have no doubt, ought to furnish a guide for immediate and efficient action on the part of parents and others.

A Home for Invalids.

Physicians who have patients expecting to come to this city for medical advice are frequently asked about proper boarding places, where good nursing and quiet can be had. The lack of such facilities has led Dr. A. T. Livingston, 260 South Sixteenth street, to arrange, in the house he occupies, for the reception of a limited number of invalids, who can there be sure of the most attentive care, and receive the visits of any physician they prefer. Dr. Livingston was, for a number of years, Assistant Physician at the New York State Lunatic Asylum, and the profession can have every confidence in referring patients to him. For terms, etc., he may be addressed as above.

Items.

—The daily papers state that diphtheria prevails in Brooklyn to an extent that has alarmed the health board, and undertakers have been instructed that the bodies of all persons dying of the disease must be buried within twenty-four hours after death, and that the funeral services must be private. Children are forbidden to attend school from houses in which there are persons sick with diphtheria.

Prof. J. Aitken Meigs.

WHEREAS, The Philadelphia County Medical Society has lost, by the death of Doctor James Aitken Meigs, an old and highly valued member and ex-President of the Society, who has been taken suddenly away from his career of usefulness; And, *whereas*, we have ever recognized in him one who, from his first entrance upon the field of medical science, devoted his time and talents, with exceptional zeal and industry, to the acquisition of knowledge, of whatever kind and from whatever source attainable, that could in any degree prepare him for a more perfect and conscientious discharge of the duties of a most responsible profession; And, *whereas*, the fulfillment of his exalted aims has been signally manifested in the success of his earlier and later efforts in behalf of rational and scientific medicine, establishing for himself, as he did, by devotion to the investigation and solution of intricate questions pertaining to medicine, a reputation, not only co-extensive with our own, but that has extended to foreign lands. Therefo e.

Resolved, That it is eminently proper that this Society should, and hereby does, express its sense of the loss sustained in the sudden death of one who, with talent of no ordinary character, and acquirements that only a few possess, was yet so simple in manner and conversation, so unassumaing, affable, and frank in deportment, as to attract and interest all with whom he came in contact.

Resolved, That a copy of these preambles and resolutions be transmitted to the aged and bereft parent of the deceased, and that they be published in the medical and in the daily papers.

QUERIES AND REPLIES.

Black Tongue.

Subscriber, Mich.—"Please state what is meant by 'black tongue,' which I see by the papers is prevailing in some parts of the country."

Ans.—The name is usually applied, in the Western States, to a form of epidemic erysipelas, which attacks the fauces and tongue. Dr. George Sutton, of Aurora, Ind., wrote a description of it a number of years ago. There is also a non-malignant form, probably owing to a parasitic growth on the tongue; and malignant scarlatina appears also at times to have been so called. See p. 482.

Dr. B., of Vt.—Your letter will be referred for reply, as directed. Your description seems to correspond to a case of spina bifida. The treatment of this malformation by iodine injections is the most promising.

Dr. T. M. M., of Texas.—The best books for a young man to study, who desires to become a pharmacist, are the U.S. *Pharmacopœia*, the *Dispensatory*, and Parrish's *Pharmacy*.

Advocate.—The blood has been classed by some physiologists among the "tissues;" but it is straining the word to do so.

Cerebrum.—The weight and size of the brain bear no ascertained relation to intellectual power. The complexity of the convolutions appears more important.

MARRIAGES.

FERGUSON—HILLMAN.—In Princeton, Mass., Oct. 21st, by Rev. E. C. Ferguson, Dr. Merritt S. Ferguson and Miss Elizabeth A. Hillman, both of Hadley, Mass.

GRAYDON—MEEKER.—At Dauphin, Pa., Nov. 4th, by Rev. D. C. Meeker, Dr. Andrew Graydon, of Philadelphia, and Miss Leila Meeker, daughter of the officiating clergyman.

KERR—GROVES.—On Thursday, Oct. 9th, at the residence of the bride's parents, by Rev. Thos. S. Park, John W. Kerr, M.D., and Nannie T., daughter of Jonas Groves, all of Springfield Tp., Jefferson Co., Ohio.

KNIGHT—HOWARD.—On November 7th, at Canton, Mo., by the Rev. J. W. Barrett, Geo. P. Knight, M.D., and Miss Eudoxia Howard, both of Monticello, Mo.

DEATHS.

BAKER.—On the 10th instant, Catharine S., relict of the late Dr. William Baker, of Wilmington, Del.

BLOOM.—At. Martinsburg, Pa., Oct. 10th, Mrs. Mary, wife of Dr. F. G. Bloom, in the 52d year of her age.

BOND.—On Oct. 25th, at Polkville, Warren county, N. J., Dr. Thomas Bond, formerly of Philadelphia.

DECKER.—Nov. 9th, Dr. John G. Decker, of Cambridge, N. Y., formerly of Jersey City, N. J., son of Benjamin W. Decker, aged 22 years and 9 months.

ROBINSON.—Entered into rest, at Flatbush, Long Island, Friday Nov. 7th, John Robinson, M.D., in the 71st year of his age.

WHITE.—At his residence, in New York, Dr. Oliver White, in the 70th year of his age.

HORSFORD'S

Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges.

MANUFACTURED BY THE

RUMFORD CHEMICAL WORKS,

1155-1206 PROVIDENCE, R. I.

A MANUAL OF

EXAMINATION OF THE EYES.

A COURSE OF LECTURES DELIVERED AT THE "ÉCOLE PRATIQUE,"

BY DR. E. LANDOLT,

Directeur-Adjoint of the Ophthalmological Laboratory at the Sorbonne, Paris.

TRANSLATED BY

SWAN M. BURNETT, M.D.,

Lecturer on Ophthalmology and Otology in the Medical Department of the University of Georgetown, and Ophthalmic Surgeon to the Central Dispensary, Washington, D. C.

REVISED AND ENLARGED BY THE AUTHOR.

1 vol. 8vo, pp. 307. With numerous Illustrations and a large Chart. Price, cloth, $3.00.

PUBLISHED AND FOR SALE BY

D. G. BRINTON,

No. 115 South Seventh Street, Philadelphia.

NEW REMEDIES.

FLUID EXTRACTS.

Coto Bark.—From BOLIVIA. Almost a specific in acute and chronic diarrhœa, cholera, cholera morbus, etc.

Cascara Sagrada.—(**Rhamnus Purshiana.**) From the PACIFIC SLOPE. A certain remedy for habitual constipation; and very useful in all cases where a laxative or cathartic is indicated. Beware of the fluid extracts of spurious varieties of this bark.

Folia Carobæ.—From BRAZIL. A powerful alterative, which exerts a marked curative action in syphilis, scrofula and kindred disorders.

Rhus Aromatica.—A remedy in diabetes, and other diseases of the genito-urinary organs.

Damiana.—(**Turnera Aphrodisiaca.**) From MEXICO. The best known aphrodisiac. Of great value in impotence, spermatorrhœa, and loss of sexual appetite.

Boldo.—(**Peumus Boldo.**) From CHILI. The new tonic. Very useful in dyspepsia, hepatic torpor, yellow fever, etc.

Berberis Aquifolium.—From CALIFORNIA. Has marked alterative and tonic powers, and has been used with extraordinary success in salt rheum, psoriasis, eczema, scrofula and syphilis.

Black Haw.—(**Viburnum Prunifolium.**) From the UNITED STATES. Employed to prevent abortion and miscarriage.

Grindelia Robusta.—From CALIFORNIA. A valuable curative agent in asthma and diseases of the air passages.

Grindelia Squarrosa.—From CALIFORNIA. Anti-malarial. Used in enlarged spleen and other malarial diseases.

Cereus Bonplandii.—(**Cereus Grandiflorus and Cereus McDonaldii.**) From MEXICO. Heart sedatives. Very useful in controlling functional and organic disturbances of the heart.

Kaki.—(**Diospyros Kaki.**) From JAPAN. Peculiar action on the mucous surfaces. Useful in mucous dyspepsia, typhoid fever, etc.

Cercis Canadensis.—Indigenous. A positive remedy in chronic diarrhœa, dysentery, etc.

Jaborandi (diaphoretic). **Guarana** (sick headache). **Fucus Vesiculosus** (anti-fat).
Bearsfoot (enlarged spleen). **Coca** (nervous stimulant). **Kava Kava** (Gonorrhœa).
Eucalyptus Globulus (antiseptic and anti-malarial). **Yerba Santa** (coughs).
Yerba Reuma (catarrh). **Wood Betony** (dyspepsia). **Ustilago Maidis** (oxytocic).
Penthorum Sedoides (catarrh). **Soap Tree Bark** (tooth wash).

CRUDE DRUGS.

Goa Powder (ringworm and diseases of the skin). **Gurjun Balsam** (a substitute for Copaiba).
Alstonia Constricta (a substitute for Calisaya).

SUGAR-COATED GRANULES.

Calcium Sulphide 1-10 gr. (for the cure of boils and carbuncles).

Our limited space prevents our describing in detail the history and application of each remedy, but to those interested in NEW REMEDIES, we will say, that we can furnish interesting information relative to the above new drugs.

PARKE, DAVIS & CO.,

DETROIT, - MICHIGAN.

Our New Remedies can be procured of the Drug Trade throughout the United States. By specifying "**P., D. & Co.'s**" in all cases, you will ensure reliable preparations of the **true drugs.**

W. H. SCHIEFFELIN & CO.'S

SOLUBLE

Pills and Granules.

UNEQUALED FOR

Purity in Composition, Solubility in Coating, Uniformity in Size, Perfection in Form and Finish.

1. The best materials are used in their manufacture.
2. No article required by a formula is omitted on account of its high cost.
3. No Pills are deficient in weight.
4. The Pills are Coated while soft.
5. There is but one Coating, which is perfectly soluble, and there is no sub-coating of resinous character.
6. The Coating is so transparent as to clearly reveal the color of the mass, and its solubility is not impaired by age.

Our list of Pills and Granules embraces those made according to the formulæ of the U. S. Pharmacopœia; also most of those in common use among the profession.

Trade supplied in Philadelphia by

1161-12 5eow ROBERT SHOEMAKER & CO.

JOHN C. BAKER & CO.'S

WITH

EXTRACT of MALT,

A combination we have lately added to our list, in response to a demand from physicians of this city, who have used our **Pure Cod Liver Oil** and other preparations. The praise accorded by all who have used it induces us to seek a wider market by calling general attention to it.

A Trial is Respectfully Solicited.

Our facilities for the manufacture of

THE EXTRACT OF MALT

are unsurpassed, and perfect reliance may be placed on the article bearing our label.

Above are in full pint bottles, and with our other specialties:—

Baker's Pure Cod Liver Oil,
" *C. L. O., with Phosphate of Lime,*
" " " *and Wild Cherry,*
" " " *Hypophosphites of Lime and Soda,*
" " *and Malt with Syr. Iod. Iron,*

Are supplied by the drug trade generally.

An astringent and balsam combined, in most convenient form for application. Rapidly becoming popular with physicians. Descriptive circular and endorsements mailed on request. Boxes of 14 suppositories to physicians, 75 cts., by mail.

HYSTERO-CHOREA.

BY HENRY C. BŒNNING, M.D.,
Interne in the Philadelphia Hospital.

The following case of hystero-chorea occurred in the wards of the Philadelphia Hospital, and its many interesting features have induced me to place it upon record:—

October 18th, 1879. Charles Webb, sixteen years old, born in England, a schoolboy, and who came to this country five years ago, has convulsions without loss of consciousness. Interrogation of the mother elicits the following history: The boy's father died last fall, of gastric cancer. The brothers and sisters of the patient are perfectly healthy, and the only case of any neurosis in the family occurred in a cousin, who had epilepsy. The birth of the patient was unattended by any difficulty, the labor was natural and easy. When he was about two months old he had what the attending physician called "congestion of the brain." At nine months he was afflicted with "fever," of which Mrs. Webb recollects the existence of obstinate constipation in the patient, the febrile state, but nothing else. Eleven years ago he received a severe blow on the side of his head, and in about one hour's time was noticed to become pallid, unconscious and rigid; soon clonic spasms developed, froth covered the mouth, and the fit terminated by a long, deep sleep. These convulsive paroxysms were repeated about three times a year until the present time, but in addition he has had, since his twelfth year, the peculiar malady for which he was admitted to the hospital. Four years ago Webb's father promised to punish Charles, but kept him in a state of agitation and suspense for two days, when, becoming violently incensed at his son for the non-performance of certain school tasks, he struck him on the head. For some time preceding he was noticed to twitch and move restlessly about, "as if he were ill at ease," and almost immediately following the above occurrence the patient had a series of paroxysms, of the same character as they were when he entered the hospital a few days ago. His fits manifest themselves only while he is awake, and his consciousness is never lost. From three to six paroxysms an hour will represent the frequency of his attacks, which are ushered in in the following manner: Suddenly his left forearm is drawn at right angles to his arm, and stands, resting on the elbow, midway between pronation and supination. Rigidity, with slight tremor, is developed, and the hand approximates the left shoulder. The muscles of his left leg are in a state of marked contraction, the feet being decidedly flexed and somewhat inverted. He has pleurothotonus of the left side. The face is directed upward, and the chin points toward the right shoulder. The orbicularis palpebrarum, the zygomatici and the sterno-cleido-mastoid, of the left side, become rigid, but the muscles of the tongue, the masseters and the buccinators are unaffected. The jaws are slightly apart, readily moved, and when requested to do so he protrudes his tongue, which does not deviate. From ten to thirty seconds the muscles remain in this state of tonic contraction, which is suddenly displaced by the clonic convulsions, in which all the parts previously rigid rapidly

twitch. The circulation and respiration are somewhat accelerated during the attack, subsiding, however, to the normal at its cessation. The pupils undergo no change. Evacuation of the bladder or the rectum does not occur. Prior to two weeks preceding Webb's admission to the ward he was able to leave his bed and recline during the day in an easy chair; constant watch, however, was absolutely necessary, to prevent him from falling from the couch, or chair, or bed. At times the patient would, weeks ago, make attempts at walking, but would succeed so poorly that recently he had been kept almost constantly on his back. Pain in the right frontal region seems to have been a standard complaint with Webb, and a tendency, when he was stood upon his feet, to lean toward the right side was also observed.

The physical condition of the patient is as follows: He is well nourished and formed, the organs are free from organic disease, and functional disturbance of any of the thoracic or abdominal viscera is not apparent. The temperature in the axilla is $98\frac{6}{10}°$. The patella-tendon reflex in the left leg was absent, in the right leg diminished. The dynamometer registers as follows: L. H. 0.; R. H. 53. There is diminished sensation over the whole of the left side, excluding the left side of the tongue and penis, with positive loss of sensation over the outer surface of the left leg. Webb's position in bed is constrained, and his body forms an arc (of a circle possibly seven feet in diameter), whose convexity is on the right side. With reference to the patient's intellect, it appears to be developed in direct ratio to the instruction he has received. For four years Webb would not voluntarily move his left leg or arm.

Oct. 22d—four days after admission—the nurse's report reads: "By actual count, the patient has had thirty-five paroxysms this day." Told him that unless the paroxysms were markedly less the following day I would apply the actual cautery to his spine.

Oct. 23d. Report: Eight paroxysms. Patient eats and sleeps well. Showed him a galvanic needle, and explained its effects, and impressed him that unless his malady be speedily abolished, I should certainly make numerous issues.

Oct. 24th. No paroxysms. By sternly directing him to raise his arm, which had not obeyed his will for many months, and assisting my order with an occasional application of the galvanic needle, I was gratified to see that my surmise of the cause of his trouble was correct; his arm was raised to the height of about four inches from the surface of the bed. The apparently useless leg was treated similarly, and the result was about the same as that obtained in the arm.

Oct. 25th. The nurse's report reads: "Improvement still going on." The arm can be raised higher; the leg moved with greater facility. A few days later the patient was out of bed and walking around in an awkward and uncertain manner.

Oct. 28th. Dynamometer L. H. 15, R. H. 50. Sensation has returned to the left leg.

Nov. 8th. Sensation everywhere normal. Dynamometer R. H. 60, L. H. 38. When he is under observation or excited his left hand and fingers twitch, and any voluntary movement is executed in a hesitative manner; though he is daily improving, having the choreiform movements still in the left arm, but only to a very moderate extent.

The medicines administered were sodium and potassium bromide, 20 grains three times a day, for a few days after admission; then a prescription was ordered, containing 5 grains each of bromide and chloride of sodium. At present, and for several days past, he is taking 5 grains of the placebo sodium chloride, three times a day. *The* treatment, however, was a purely psychical one; threats and the infliction of pain determined the cure. Without *severe* discipline we could have accomplished nothing.

An interesting feature is the patella reflex sign, which was carefully studied. When Webb entered the ward it was *absent;* at the time I write it is almost completely restored; proving that as an exponent of organic trouble the objective sign referred to cannot invariably be trusted.

ERGOT IN FIBROUS TUMORS OF THE UTERUS—DEATH DURING A FIT OF EPILEPSY.

BY H. V. FERRELL, M.D.,
Of Carterville, Ill.

Mrs. E. A. G., aged 33 years; married ten years. Two children; youngest 6 years old. No miscarriages. Puberty established at fifteen; duration of flow at the beginning five days, and profuse. Became irregular at twenty-three; duration of flow increased to seven days, and most profuse; never painful. Has been an epileptic for eight years, but has not been troubled with it much for two years past. Fits of anger or excitement have appeared to act as exciting causes of an epileptic seizure. Felt a "lump" just behind the "cross bones" about five years ago, since which time, with the exception of about

two months during the past summer, she has been a constant sufferer from menorrhagia and metrorrhagia. Last February her attending physician, after examination, diagnosed pregnancy. To relieve the pains of the uterine contractions which occasionally occurred he was in the habit of giving morphia.

I was called to see her October 20th, 1879. Upon inspection, I found the abdomen occupied by a tumor extending upward to near the ensiform cartilage, and laterally to the ilia. Per vaginam, the cervix was found about an inch in length, fissured laterally, low in the pelvis, and the os not dilated enough to admit the point of the index finger. Per rectum, the posterior surface could be felt hard and nodular. The entire mass was quite movable, and carrying with it, in all directions, the uterus. Posteriorly and laterally, to the anterior segment, the uterine probe was arrested just behind the os internum. Anteriorly, it passed upward to the extent of five and a half inches, where it became arrested. Diagnosis, submucous fibrous tumor of the uterus. I applied tampon, and gave tr. cinnamon and gallic acid to arrest the hemorrhage.

October 24th. The hemorrhage not being arrested, I introduced a sponge tent, and ordered Squibb's fl. ext. ergot, gtt. xx every four hours.

October 29th. Powerful uterine contractions; hemorrhage still continuing; patient much exhausted; pulse 132, weak; had a severe epileptic convulsion.

October 30th. Os dilated to the size of a silver dollar, and occupied by the presenting tumor. Only one sponge tent was introduced, which remained about eighteen hours. The tumor was exceedingly vascular, bleeding freely when seized by the tenaculum or volsellum, which I did, hoping to remove it by Emmet's method of traction, which was found in this case to be impracticable.

Hemorrhage still being profuse, and threatening the life of the patient daily, the uterine cavity was copiously injected with warm water, followed by two drachms of Churchill's tincture of iodine. After this we had no more trouble from hemorrhage. On the evening of October 30th the tumor was found to be disintegrating and coming away. The uterine contractions were kept up by the ergot, which was now ordered in thirty-drop doses every six hours. When the contractions would partially subside, they were always promptly aroused by the ergot. After the permanent arrest of the hemorrhage, the patient improved in strength, the tumor was growing less and less, masses as large as the thumb were washed away daily, besides a constant discharge of putrilage.

Sunday morning, November 2d, I visited her, in company with Dr. Harris, of Crainville, who kindly assisted me in all the treatment. She expressed herself as feeling stronger than usual; had taken more nourishment than common. Skin normal; pulse 96; tumor on a level with the umbilicus We were intending to postpone washing out the uterus and vagina till our usual time in the afternoon, but on examination we found the discharge of the broken down masses to be more abundant than common, and decided to proceed at once. Sims' speculum was introduced, and through a gum-elastic male catheter we injected nearly a gallon of warm carbolized water. The os was well dilated, and the water returned freely. The patient made no unusual complaint. Uterine contractions increased in force. After the washing was completed, and before she was replaced in bed, she was seized with another severe epileptic convulsion, with nothing special to mark it from others of the same kind, till the long-drawn, stertorous inspirations which usually indicate the termination of the fit began to grow more and more infrequent, the lips livid, the eyelids partially open, the pupils dilated, cold sweat standing out upon the face—and our patient was dead.

Among the more prominent features of this case we may note the fact that the injection of warm water and the tincture of iodine promptly and permanently arrested the hemorrhage after all other means had failed. Ergot produced and kept up powerful uterine contractions, which, by interfering with the nutrition of the morbid growth, doubtless were rapidly causing its disintegration and expulsion.

What should be the treatment of such tumors occurring in epileptic subjects, where the uterine contractions may act as an exciting cause of the paroxysm? The arrest of the hemorrhage is absolutely essential to the life of the patient, and in that, as well as in the removal of the tumor, by whatever means it may be done, contractions of the womb, I think, are indispensable. Can any treatment be instituted that will control the epilepsy, and at the same time not interfere with the other treatment? I think it possible; but from the exceeding rarity of a fatal termination in a paroxysm of epilepsy, I was not led to suspect such a result in this case, else I should have instituted such treatment after the first paroxysm. If I was treating another such a case, I should treat it in the same way as this, with that exception.

Hospital Reports.

JEFFERSON MEDICAL COLLEGE HOSPITAL.

CLINIC OF PROF. GROSS, OCTOBER 4TH, 1879.

REPORTED BY FRANK WOODBURY, M.D.

Treatment of Fractured Clavicle by the Silicate Bandage.

A man, giving the history of a recent injury of the shoulder, caused by a fall from a wagon, was brought before the class, to exhibit the manner of dressing fracture of the clavicle. After pointing out the usual position of the fracture, about the middle of the clavicle, and calling attention to the characteristic deformity of the bone, caused by the riding upward and backward of the inner fragment and the depression of the shoulder, Prof. Gross spoke of the principles which should guide the treatment. The elbow must be brought in front of the chest, the fingers of the injured side resting upon the sound shoulder. In this position, if the elbow be well supported, it will be found that the deformity has disappeared, and the fracture is perfectly reduced. To keep the parts in this position until union takes place, some form of retentive dressing is required. He frequently uses, and prefers, the silicate of soda dressing, the solution being applied with the hand to the ordinary roller bandage. The patient keeps on his ordinary gauze undershirt, or the dressing is applied over a layer of cotton wadding, which keeps the silicate from the skin and makes it last longer. Indeed, one application of this dressing is generally sufficient, the union being sufficiently firm, at the expiration of a month or six weeks, to permit its removal. In this respect it has an advantage over the plain roller, applied as directed by Desault, as the roller becomes easily disarranged and requires frequent removal. Prof. Gross formerly used adhesive straps, but had concluded that the soluble glass was a better application; plaster of Paris might be used for this purpose, but on account of its weight it is not so good as either of the others previously named.

Diastasis of Humerus.

"This child, three years of age, is said to have fallen down stairs a few days ago, and was brought yesterday to the Out-patients' Department, where an injury of the arm was detected and an appropriate bandage and splint applied. We observe considerable swelling of the arm above the elbow, and on motion, pain and abnormal mobility are found to exist, and grating or crepitus elicted. This is not a true fracture of the bone, but is a separation of the epiphysis or articular extremity of the bone from the shaft or diaphysis. There is obvious parting, here, of the condyles from the shaft of the humerus, at the situation of the cartilaginous layer. This separation is termed a *diastasis;* in young subjects it is more common than fracture of the bone, and may occur at any time prior to the sixteenth or seventeenth year, when the condyles unite with the shaft, and the cartilage becomes ossified. The upper epiphysis, or head of the humerus, does not unite with the shaft until some time later, generally about the twentieth year. Cases like this are to be treated as ordinary fractures, by padded angular splints. Union may be expected earlier than in ordinary fracture of the humerus occurring in adults.

Removal of Part of Tonsils for Hypertrophy.

"As a result of repeated attacks of inflammation, this little girl, four years of age, whose constitution is not very strong, has marked enlargement of the tonsils, which interferes with her breathing, particularly at night. Her mother informs us that she lies with her head extended, or thrown backward as far as possible, and that she snores lustily. The entrance of air being impeded by these large tonsils, she retracts the head so as to bring the upper air passages nearly in a line with the trachea, so as to breathe more freely. Owing to the increased efforts at inspiration, the child also sweats at night; not perspires, but *sweats*, which is the only proper term to use to describe the condition.

"Cases of enlarged tonsils present three peculiarities; (1) lying with the head thrown back, (2) snoring, and (3) sweating. This affection is most common in children of a delicate habit of body; especially those laboring under, or predisposed to, a strumous taint. Associated with the state just named, we generally have cold extremities, a capricious appetite, tumid or enlarged abdomen, flaccid muscles, pallid face, and everything denoting a weak condition of the system. This disease of the tonsils manifests itself very early in childhood, nearly always before the tenth or twelfth year, and I have found it congenital in a number of instances. I would not be surprised if it came on in the present case soon after birth.

"As regards treatment, it might be observed that in its earlier stages improvement may be expected from remedies directed to the general system; a course of chalybeates, good, nutritious food, and occasional laxatives; with a local application, from time to time, of a solution of nitrate of silver—

℞. Argenti nitratis, gr. x to xij
Aquæ, ℥j M.

To be applied every other day, and subsequently twice a week. This should be gradually increased to twenty or thirty grains, if necessary, and will be found quite efficient. The mother should also be directed to frequently rub the tonsils with her finger, which will have the effect of producing the absorption of the inflammatory deposits to which the enlargement is due.

"When the condition has existed for a long time, nothing save the excision of a portion of the gland will prove of any service; but only the part of the gland protruding between the pillars of the fauces is to be removed. In the adult this may be readily performed, without an anæsthetic, by grasping the prominent portion of the gland, drawing it away from the arches of the palate with a volsellum, and excising it with a blunt-pointed, curved bistoury, introduced with its back to the tongue, cutting upward and inward. In young children a little chloroform is needed, to prevent struggling. Before the introduction of anæsthetics I was in the habit of wrapping a sheet around the little patient, so as

to confine the extremities, and make a cylinder of his body; thus completely controlling a child who otherwise would be exceedingly troublesome; even then, with the child as immovable as possible, it was often a difficult operation, from the crying and perverseness of the patient.

"For operating upon children, an instrument termed the guillotine or tonsillotome has been devised. The redundant part of the gland is to be included in this fenestrum, and by withdrawing the blade it is removed. Where you have perfect control of your patient it may be used with advantage. The difficulty is in getting off enough of the gland in this way, and for this reason I generally prefer using the bistoury.

"The operation is a very simple one. First seize hold of the gland with the toothed forceps, or volsellum, as it is called; then draw the gland out from the arches of the palate, in which it is buried; and finally, with the curved, probe-pointed bistoury, cut away the portion that is considered necessary. Both tonsils may be operated on at one sitting, but where there is a good deal of bleeding the second may be deferred until a future period.

"A small amount of bleeding is beneficial, as it relieves the engorgement of the parts, but sometimes it is excessive, the parts being very vascular. Long continued irritation gives rise to plethora here, in the same manner that the constant irritation accompanying stone in the bladder produces a similar result in old persons; there is an enlargement of the veins of the tissues around the neck of the bladder, so that the operation of lithotomy may be followed by profuse hemorrhage.

"The hemorrhage after this operation is generally checked by gargling with cold water, or vinegar and water, and holding the mouth open, so that there is free access of the air. Soft diet must be used for a few days, and the child carefully protected from cold.

Incipient Hip Joint Disease. Remarks on the Nature of the Affection and its Appropriate Treatment.

"As this child enters the room, we notice that he shrinks from the light, and on looking at his eye we find a white speck, due to a superficial ulcer of the cornea. I have no hesitation in pronouncing this a case of constitutional taint, or in diagnosticating the affection as one of a scrofulous nature; especially after hearing that he has been ailing for some time; and also, upon examination, finding a defective condition of the upper incisor teeth. He does not, however, come on account of the condition of the eye, but his father brings him because there is some lameness as he walks. This was first noticed about six months ago, but for the last six weeks it has appeared to be more marked.

"His legs seem to be of equal length, and the heels on the same level. His muscles are rather softer upon the right side than upon the left; this is most marked in the muscles of the thigh, producing flattening of the nates upon this side, but there is no great alteration in the contour. The gluteo-femoral crease, as I am in the habit of calling it, is less evident upon the right side than it is in the left. This I regard as very important in the diagnosis of hip-joint affections; as a slight change in this crease is easily observed. Now, let him walk, that we may watch the movements of the limbs. As he goes around the amphitheatre, it is observed that he bears more weight upon one limb than upon the other, and throws the affected limb out a little more than if it were perfectly sound.

"The father tells us that the child sometimes starts up and cries out in its sleep; he appears bewildered and frightened, and the parents have to go to him and quiet him.

"This child has all the symptoms of early hip-joint disease. Notice, as he stands erect, the outline of the back and the marked curve in the dorso-lumbar and sacral regions, a compensating curve required by the position in which the child is obliged to place himself in order to take the weight off from the right foot.

"One of the earliest symptoms of hip-joint disease is pain in the corresponding knee; and I do not recall that I ever saw a case in which it was not present. This pain is worse during damp states of the atmosphere, for reasons which are not clear, except that it may be connected with electrical conditions. This knee-pain continues for two or three months, and we then find it ascending to the hip; and at the same time the patient walks with more and more difficulty; the limb apparently is longer than the sound one; though only apparently, as there is no actual difference, until the later stages of the affection, when the head of the thigh bone becomes destroyed by ulceration, and the limb correspondingly shortened. The apparent lengthening is due mainly to tilting of the pelvis, and the dragging of the limb in walking.

"The inflammation generally commences in the synovial membrane, or in this membrane and the underlying articular cartilage. Sometimes the disease begins in the head of the thigh bone, in the spongy tissue. From the original focus, it soon spreads to the surrounding parts, so as to involve in succession all the proper structures of the joint. Pus forms, caries or necrosis follows, producing an abscess, which may point in front of the thigh, but more frequently discharges posteriorly, or on the outer side of the hip. The accumulating pus may burrow a considerable distance, dissecting the muscles from each other, and produce disorganization of surrounding parts. At this stage of the disease there is always serious trouble in the head and neck of the thigh bone, from progressive ulceration; sometimes necrosis takes place, from the violence of the disease, but more often the head and neck of the bone disappear entirely, as a result of caries.

"If the pus do not meet with ready outlet, it may discharge into the pelvis, and find its way into the bowel or bladder; or, in the female, it may appear in the vagina.

"At this stage of suppuration there is always fever, of a hectic character, resembling that of pulmonary consumption; and if the diseased head of the bone be not removed by surgical operation, the patient is almost sure to perish, the tendency being to a fatal termination. I will speak of the nature of the disease more fully at a future time, and need only state at present that it is essentially of a scrofulous character; a term

commonly used by surgeons in speaking of diseases presenting certain well-known appearances, although they do not all agree concerning its cause. I have come to the conclusion that this disorder is unquestionably of a strumous nature, and look upon it as a remote outgrowth of syphilis. I have long taught that there can be no disease of this kind without a previous taint of the system, and I have always maintained that where this predisposition exists the disease may be called into existence by comparatively slight causes, such as blows or falls, or suppression of the cutaneous perspiration, which, in a healthy subject, could not be followed by such peculiar manifestations. When this tendency is present, trivial causes may produce severe consequences. I know that my friend, Dr. Sayre, of New York, who has given a great deal of attention to this subject, holds that hip-joint disease may arise from ordinary injuries in a healthy constitution, but I cannot agree with him. We cannot, by slight means alone, give rise to pulmonary consumption; there must be a constitutional predisposition, or else the tubercular deposit will not appear. It is the same with hip-joint disease. In the present case, we learn that a sister died with consumption, and another child died with marasmus. I have made a practice of making complete post-mortem examinations in cases of death from hip-joint disease, and I have always found tubercles coexisting in other parts of the system, and I have published such cases. Bear in mind, then, that a constitutional predisposition of a peculiar kind always accompanies hip-joint disease.

"What treatment shall be recommended? There is no serious disease as yet. We shall, however, insist, unconditionally, upon rest for this joint—perfect rest. The child shall be placed upon a comfortable mattress, and care shall be taken to have the sheet perfectly smooth beneath him. Extension shall then be applied to the affected leg, by the ordinary lateral strips of adhesive plaster, just as in the case of a fractured femur, and four or five pounds weight shall be used. A roller bandage will be run from the foot to the hip. This dressing will keep the muscles quiet, and prevent them from falling into spasms, which would draw the head of the bone violently against the inflamed acetabulum, and cause severe pain and nervous irritation. The foot of the bed shall be a little raised, in order to make the weight of the body produce counter-extension.

"His diet shall be nutritious, but not too stimulating, with as little medicine as possible. Perhaps once or twice a week he would be benefited by a gentle purge:—

℞. Hydrarg. chlorid. mitis, gr.ss
Pulv. jalapæ, gr.iij. M.
Sig.—At night.

"Or he could take one part of calomel to three or four of jalap. This is essentially the treatment of the late Dr. Physick, who considered rest of paramount importance, as does every surgeon of prominence at the present day.

"When an abscess forms around the joint, the proper treatment is to remove the matter at the earliest possible moment, by a free incision, not allowing it to accumulate. In the later stage when the head and neck are very much diseased, the proper method is excision, not amputation; the caries or necrosed bone must be removed, or the patient will inevitably perish by hectic and exhaustion.

"The digestion and appetite of the patient shall be looked after, and tonics given. Quinine and iron, or the syrup of the iodide of iron, will be of great benefit. His diet shall consist largely of milk, eggs, and a little of the red meats; indigestible food, such as pastry, shall be rigidly excluded. If it is found to agree with the stomach, cod-liver oil, or some of its preparations, may greatly improve the nutrition of the little patient, and hasten his recovery."

Myeloid Sarcoma of the Inferior Maxilla.

This little girl, six years of age, from May's Landing, New Jersey, for the last six months has been laboring under some affection of the lower jaw. She had scarlet fever three years ago, but, it was believed, recovered without sequelæ.

"This has been thought to be a case of necrosis of the jaw, which, as you know, frequently occurs, as a result of ordinary causes, acting upon a slightly depraved constitution, or one disposed to strumous disease. Where this taint is present, the slightest causes may give rise to ulceration or necrosis of the bone, as in the preceding case. I have not examined the child yet, but wish to direct attention first to the constitutional condition.

"There is a history here of toothache, and it is possible that the teeth may be necrosed too. Examining the parts, we notice evidences of disease in the teeth, gums and bone; there is a tumor here, resembling epulis. Various foreign growths may occur in this situation; the tumor may be fibroid, cystic, epitheliomatous, carcinomatous, or some form of sarcoma. It seems to extend into the body of the lower jaw, which is decidedly enlarged. There are no enlarged lymphatic glands under the jaw, so that the growth is probably sarcoma rather than cancer.

"Administering a little ether, and attempting to remove the growth, I find that it occupies the middle of the lower maxilla, under the incisor teeth, which have been displaced. The bone is reduced to a mere shell. The tumor evidently took its rise in the spongy portion of the bone, and in its development pushed aside the two layers of compact tissue. The cavity left by the removal of this growth can be packed with cotton wet with a dilute solution of subsulphate of iron. It will heal by the granulating process. I do not think it probable that there will be any bleeding of consequence.

"The tumor will be examined microscopically, and from the report we shall be able to determine whether the growth will be likely to return. Some forms of sarcomatous disease of bone are scarcely less malignant than carcinoma itself."

[Sections of the tumor, made by Dr. MacConnell, demonstrated the growth to be a myeloid or giant-celled sarcoma.]

Medical Societies.

AMERICAN PUBLIC HEALTH ASSOCIATION.

The seventh annual meeting of the American Public Health Association was held in Nashville, Tenn., commencing at 12 o'clock, noon, on the 18th ultimo, and continued in session four days. Nearly two hundred members were in attendance, and the proceedings were generally harmonious throughout the session.

President J. L. Cabell, M.D., of the University of Virginia, presided, 1st Vice President J. S. Billings, U. S. A., and 2d Vice President, Samuel Choppin, of New Orleans, sitting upon his right and left, while Dr. E. H. Janes, of New York, Secretary of the Association, occupied the clerk's desk.

After an appropriate prayer by Rev. O. P. Fitzgerald, editor of the Nashville *Christian Advocate*, and the reading of the list of members so far as they had been registered, the subject of the National Medical Library was taken up, and the committee appointed to memorialize Congress in regard to the publication of the index catalogue of the library made its report. It was shown in the report, that as a result of the memorial and personal efforts of the committee, Congress appropriated $20,000 for printing and binding the first and second volumes of the Library of the Surgeon General's office: the report recommended that the committee be continued, with instructions to urge upon Congress the necessity for providing for the completion of the work.

In adopting the order of business as laid out by the executive committee, it was resolved that, after the leading paper on each subject was read, all discussion should be limited to ten minute speeches.

Dr. E. M. Hunt, of New Jersey, chairman of the Publication Committee, reported that the publication of last meeting's transactions was unavoidably delayed, but would soon be forthcoming. Adjourned till 3 P.M.

AFTERNOON SESSION.

On reassembling, Col. Geo. E. Waring, of Newport, Rhode Island, read a paper upon "The Drainage and Sewerage of Cities," taking the position that there should be a distinct separation between the application of sewerage to the removal of domestic and manufacturing wastes and soil water, and the construction of conduits for the protection of public and private property against the action of storm water—the one a sanitary and the other an engineering measure. He believed that waste pipes should not be over 6 inches in diameter, until the contents at highest rate of flow half filled the pipe; that the sewage was better carried off in small pipes, and that it could be more readily utilized for agricultural purposes if not mixed with storm water, besides being much cheaper to construct, and easier to ventilate. He thought that perfect sanitation was more important than quarantine, as, by such measures, yellow fever would not be capable of coming into a city. He regarded this disease a minor one, and stated there were others more fatal, but which were equally preventable by proper sanitation.

A discussion of the subject was participated in by Drs. Ames, of Boston; Wite, of Milwaukee; Compton, of Evansville, Ind.; A. N. Bell, of New York; Elisha Harris, of New York; Ezra Hunt, of New Jersey; E. Lloyd Howard, of Baltimore; Col. T. S. Hardee, of New Orleans; Dr. Tadlock, of Knoxville, and Dr. Gihon, of the Navy.

Invitations were received by the Association to visit Belle Meade (Gen. Harding's stock farm, near Nashville), the Young Men's Christian Association rooms and library, and Ward's Female Seminary; and the "freedom of the wires" was tendered members of the Association by J. Compton, Esq., the Superintendent of the Western Union Telegraph Company.

The Association adjourned till 7.30 P.M.

EVENING SESSION.

In the evening Gov. A. S. Marks delivered a welcoming address to the Association, and was followed by Dr. E. M. Wight, President of the Tennessee State Medical Society, on behalf of that Society. The Mayor of the city, Thomas Kercheval, Esq., also delivered an address of welcome, after which Dr. Cabell, President of the Association, delivered his annual address, which was an exhaustive exposition of the organization and trials and hopes of the National Board of Health. This concluded the first day's proceedings.

Second Day.

The Association met at 10 A.M., President Cabell in the chair. Proceedings were opened with prayer, after which a list of new members was read and approved; an invitation to visit the residence of Mrs. Jas. K. Polk, between 1 and 2 P.M., was accepted.

The first paper of the day was prepared by Elliott C. Clark, Civil Engineer, of Boston, and read by Dr. Folsom, of that city, in the absence of Mr. Clark, the subject being "City Scavengering at Boston." The paper explains, at length, the plan adopted, which includes the removal of house effects, ashes, and dry house dirt; cleaning of streets, and street catch basins, and cleaning of privy vaults and cesspools; for each of these a special and separate provision is made, at a total cost of $340,000, for a population of 360,000 souls. The work devolves upon a committee of five members of the City Council, who control the annual appropriation and its expenditure. The superintendent of the work is appointed by the Board of Health and approved by the Mayor, and the system has been found to work well, the secret to success being that very few changes are made in the superintendent and those who do the labor. All the men employed are fitted for it by long training, the foremen having been promoted from subordinate positions, and many of the laborers having been employed for five, ten, and twenty years.

Dr. Hugh M. Thompson, of New Orleans, read a paper on the "Disposal of the Garbage of New Orleans," showing that while in former years it was used to fill up vacant lots, it is now carted on to scows and carried two miles down the river, where it becomes food for fishes.

The foregoing papers were discussed by Drs. Ames, of Boston: Brewer, of New Haven; Bell, of New York; Campbell, of Augusta; Barr, of Abingdon, Va.; Col. Waring of Rhode Island; Drs. Wight, of Milwaukee; Otterson, of Brooklyn; Hunt, of New Jersey; Durgin, of Boston; Thompson, of New Orleans; Harris, of New York; Taury, of Baltimore; and Folsom of Boston. The question of utilizing the garbage, etc., being the point at issue.

"Municipal Sanitation," by Dr. E. G. Janeway, and read, in part, by Dr. Janes, Secretary of the Association, came next in order. It suggested, with reference to construction of dwellings, that plans be filed, with application for license to build, and that the kind of material, nature of ground to be built upon, treatment of exterior of foundations, plans of plumbing, drainage, etc., should be stated. Reference was made to a new law in New York, requiring the inspection of tenement houses; also provision in regard to the building of future houses, etc. Referring to facts in the study of contagious diseases, Dr. Janeway regards limited observation dangerous, and attaches more value to isolated cases in country places than large numbers in crowded cities; he thinks it quite important to have a uniform system for collecting and publishing health statistics, and referring to the death rate, said that irregularities occurred from estimating the population, or from basing it upon the last census. A number of resolutions were offered in this paper, for adoption, looking to uniformity in health statistics, but no action was taken. Adjourned until three P.M.

AFTERNOON SESSION.

Upon reassembling Dr. A. L. Gihon, U.S.N., read a paper upon "The Protection of the Innocent and Helpless Members of the Community from Venereal Diseases, and their Consequences." The subject was ably presented, and brought out considerable discussion, which was participated in by Drs. Sternberg, of the Army; Bailhache, of the Marine Hospital Service; and Gibbs, Campbell and others; at the conclusion of which a motion was made by Dr. J. M. Keller, of Arkansas, that the President appoint a committee of three to prepare a plan for protection against venereal diseases. Adopted.

The subject of certain amendments to the Constitution was then brought up by the Executive Committee, in a report, wherein it was resolved by said committee that the Association reject the proposed amendments, and that an Advisory Committee, of which the President of the Association shall be Chairman, be nominated by the Executive Committee, for appointment by the President, to be confirmed by the Association; this committee to be constituted of one member of the National Board of Health, one from each State [Board of Health, one from each State not having a State Board of Health], and one from the medical departments of the Army, Navy, and Marine Hospital Service. This resolution was adopted, after striking out that portion included in brackets.

Dr. Hunt announced that he had received the published volume of the transactions at Richmond. Adjourned.

EVENING SESSION.

Dr. Alfred A. Woodhull, U. S. A., who was unable to attend, presented, through Dr. Hunt, an elaborate paper on the subject, "May not Yellow Fever Originate in the United States," and giving an etiological study of the epidemic at Savannah in 1876. Dr. W. claims that this epidemic did unquestionably originate in Savannah, and was not traceable to importation. He brings forward many ascertained facts, and supports his argument in a most elaborate manner, and to the entire satisfaction of those who believe in the endemicity of this disease. Even a synopsis of the paper would occupy more space than this report contemplates.

Dr. T. J. Tyner, of Memphis, followed, with an interesting paper on the "Etiology of Yellow Fever in Memphis, and Remarks on Quarantine," in which he took the position that "yellow fever originated in Memphis and other cities of America *de novo*; or, admitting that it is an exotic, I believe its spread is absolutely dependent upon some local condition;" and he believed that quarantine could only be enforced by martial law. A lively discussion of the above two papers followed, in which Drs. Early, of Kentucky; Hayes, of Florida; Wise, of Memphis, and Stillwell, of Kentucky, ranged themselves on the side of endemicity, and Drs. Elliott, of Savannah; Austin, of New Orleans; Campbell, of Augusta, and Bell, of New York, took the ground it was an exotic; and each side proved its position by a multitude of evidence and incontrovertible facts! Adjourned.

Third Day.

The Association was called to order at 9.30 A.M., President Cabell in the chair. After prayer by Rev. T. G. Jones, a list of new members was read and approved.

The election of officers of the Association for the ensuing year was then entered upon, and resulted in the choice of the following gentlemen: President, John S. Billings, U.S.A.; First Vice President, Samuel Choppin, of New Orleans; Second Vice President, R. C. Kedzie, of Lansing, Mich.; Treasurer, J. B. Lindsley, of Nashville; Executive Committee, Drs. C. B. White, New Orleans; J. L. Cabell, Virginia; E. M. Hunt, New Jersey; J. D. Plunkett, Tennessee; C. F. Folsom, Massachusetts; A. L. Gihon, U.S.N. Dr. Cabell subsequently declined, and Dr. J. G. Thomas, of Savannah, was elected to fill his place on the Executive Committee.

While the election of officers was in progress, Dr. Wm. H. Brewer, President of the State Board of Health of Connecticut, read a paper upon "Rotten Wood," and gave an account of some experiments made upon various kinds of wood, showing the amount of soluble matter they contained, and the effect of decaying wood upon health.

Invitations for the next meeting of the Association were received from Evansville, Ind., and New Orleans; the latter was accepted, the date to be fixed by the Executive Committee.

The following committee was appointed by the Chair, to devise and suggest some plan for the control of the spread of venereal diseases, and report the same at the next meeting: Drs.

A. L. Gihon, W. B. Griffith, J. M. Keller, Sternberg and P. H. Bailhache.

Dr. J. D. Plunkett, President of the State Board of Health of Tennessee, read a paper upon "Cotton as a Fomite," in which he took the ground that it was capable (ginned or unginned) to absorb or imbibe pestilential virus, and gave the names of many prominent authorities on the subject, adding that "the recognition of cotton as one of the class of extra hazardous fomites is well nigh universal, as its capacity to transmit or communicate yellow fever, or other infectious diseases, has, up to this time, scarcely been questioned."

Dr. G. B. Thornton, President of the Memphis Board of Health, read a very interesting paper upon the "Memphis Yellow Fever Epidemic of 1879." After stating that the question of importation or of local origin of the disease is not definitely settled by the resident profession, and adding that he is unable to satisfy himself as to the date and exact locality of the first case, he goes on to say that in every previous epidemic no trouble exists in tracing it to importation. He then gives a history of the epidemic, and of the condition of the city, doubting the prevailing opinion that the vaults, etc., gave virulence to the disease, and rather favoring the idea that it was the result of last year's visitation.

Adjourned till 7.30 P.M., there being no afternoon session, as the Association had accepted an invitation to visit Belle Meade.

EVENING SESSION.

Dr. Henry F. Campbell, of Augusta, Ga., read a paper on the "Yellow Fever Quarantine of the Future," and stated, while he at first disliked the idea of a national or "central" quarantine, yet he now believed it to be imperatively demanded, and that a national quarantine against yellow fever was the quarantine of the future.

A discussion of the paper followed, participated in by Drs. Holliday, of New Orleans; Dake, of Nashville; Thornton, of Memphis; Rauch, of Chicago; Thompson, of Memphis; Bell, of New York; Waterfield, of McKenzie; Harris, of New York; Hargis, of Pensacola; Clapp, of Memphis; Taney, of New Orleans; Hunt, of New Jersey; and Peters, of New York. The discussion took a very wide range, covering not only the question of quarantine, but all known and some unknown theories of contagion, infection, etc., and only proved, as was stated by Dr. Taney, of New Orleans, that, "from the earliest times to the present day, there has been no progress made in positive knowledge, or anything settled in regard to yellow fever and how to quarantine it." Adjourned.

Fourth Day.

The Association was called to order at 10 A.M., President Cabell in the chair. After prayer by Rev. F. A. Shoup, the list of new members was read and approved. The Treasurer's report was referred to an auditing committee, composed of Drs. Smith, Bell, and Elliott.

The following papers were read by their titles, and referred to the Publishing Committee: "Post-mortem Examinations and their Relations to Public Health," by Dr. E. G. Janeway, of New York; "Action of Vegetable Acids on Tin," by Prof. Chas. E. Monroe, U.S.N.; "Water Supply," by J. Chandler, of Memphis; "International Quarantine," by Dr. B. W. James, of Philadelphia; "The Most Effective Way of Preventing the Spread of Venereal Disease," by the same; "On Sanitation of Nashville," by J. B. Lindsley, M.D.

Dr. R. G. Jennings, of Little Rock, read a paper on "Quarantine and its Results in the State of Arkansas, in 1879," in which he gave a history of the precautions taken, and concluded by saying that "no other inference can be drawn but that a thorough system of quarantine, rigidly enforced, guarantees a certain degree of protection, if not exemption, of the people from the visitation of yellow fever, proportionate to the vigilance of the officers and guards who are charged with the enforcement of its regulations."

Dr. D. C. Holliday, of New Orleans, made a report from the Committee of the New Orleans Medical and Surgical Association, on the subjects submitted by the Executive Committee of the Public Health Association, covering the points: 1. How to deal with a city in the yellow fever zone; 2. How to prevent the importation of a first case; 3. How to deal with a first case; 4. The duty of local boards to report such cases, even though doubt exists as to diagnosis; 5. Relative to moving unacclimated population from an infected place; 6. Measures of isolating dangerously infected places; 7. Organizations for relief and treatment of the sick; 8. Measures of preventing spread of the disease by railroads, including management of transfer stations; 9. Inspection of steamboats, and should stations be established by the National Board of Health? 10. Result of the coöperation given by said Board. The report was satisfactory to the Association and very flattering to the National Board.

Col. John F. Cameron, of Memphis, read a paper upon "Camps and Depopulation of Memphis, Epidemics of 1878–9," giving a description of the camps, and the manner of conducting them.

Dr. A. N. Bell, of New York, read a paper upon "Steamboat Inspections," illustrating his remarks with drafts of the holds of various kinds of vessels, and showing how the filth collected between the "ribs" of the vessels, from the keelson to the deck.

A number of preambles and resolutions were then presented by the Advisory Committee, eulogistic of the National Board of Health.

The subject of yellow fever at New Orleans in 1879, and the enforcement of quarantine, were discussed, during which Dr. Jerome Cochrane suggested the following "problems of yellow fever." 1. That yellow fever was the product of specific poison. 2. That the poison was something introduced into the person. 3. That it was material. 4. That it could be carried from place to place and give rise to outbreaks of fever where it had not previously existed.

President Cabell announced the appointment of the Advisory Committee, as follows:—

Alabama, R. D. Webb. California, Dr. Henry Gibbons. Florida, Hon. S. C. Cobb, Pensacola. Georgia, Dr. H. F. Campbell. Illinois, Dr. J. H. Rauch. Indiana, Dr. J. F. Hibberd. Mississippi, Dr. Wirt Johnston. Louisiana, Dr. D. C. Holliday. Maryland, Dr. James A. Stewart.

Massachusetts, Dr. Azel Ames. Pennsylvania, Dr. Henry Hartshorne. Ohio, Dr. T. C. Minor. Missouri, Dr. Homan, of St. Louis. Rhode Island, Dr. E. M. Snow. Tennessee, Judge J. W. Clapp. Virginia, Dr. L. S. Joynes. Michigan, Dr. H. B. Baker. West Virginia, Dr. James E. Reeves. District of Columbia, Dr. Toner. New York, Dr. Elisha Harris. North Carolina, Dr. J. F. Wood. South Carolina, Dr. C. W. Chamberlain. New Hampshire, Dr. L. F. Conn. Vermont, Dr. H. D. Holtar. Texas, Dr. Rutherford. Wisconsin, Dr. E. L. Griffin. Minnesota, Dr. C. N. Hewitt. New Jersey, Hon. L. Lilly. Arkansas, Dr. A. L. Breysacker. Kentucky, Dr. Pinckney Thompson. Delaware, Dr. Bush. United States Army, Dr. McParlee. United States Navy, Dr. B. F. Gibbs. National Board, Dr. Stephen Smith. Commissioner of Education, General Eaton. Adjourned.

AFTERNOON SESSION.

The Treasurer's accounts were reported correct by the Auditing Committee, and turned over to his successor.

The conflicting theories of quarantine and the isolation of Yellow Jack occupied the afternoon session, and the most diverse opinions were expressed. Hon. E. E. James, of Chattanooga, covered the subject, when he said: "From the conflicting opinions of the many gentlemen so distinguished in medical and sanitary science, I have been convinced that yellow fever is epidemic, endemic, exotic and indigenous, foreign and domestic, climatic and anticlimatic, national and international; and so believing, I am in favor of that government having the longest purse and greatest power taking charge of it." Adjourned.

EVENING SESSION.

The committee appointed last year to distribute money to the widows and orphans of physicians who died during the epidemic, reported that no action had been taken, as no cases requiring relief had been brought to their notice, but that Dr. Peters, of New York, had collected and distributed money in that direction. Dr. Peters stated he had acted as agent of the Medical Association of New York, and that a considerable sum had been distributed, but that the Society did not wish to become the head centre and distributor of such a fund, but desired each State should look after its own needs.

The discussion of the resolutions laudatory of the National Board of Health, offered at the morning session, consumed the remainder of the evening, and were finally adopted, after which the usual resolutions of thanks were passed, and the Association adjourned, to meet in New Orleans at a date to be announced by the Executive Committee.

The following are the preamble and resolutions referred to:—

WHEREAS, The National Board of Health has, in accordance with the law which created it, requested the advice of the American Public Health Association regarding the form of a permanent national health organization of the United States, including its relations to quarantine, both maritime and inland, and,

Whereas, The opinions of the Advisory Council of the Association, upon the subject of health legislation, collected and presented to this body through Dr. J. M. Toner, Chairman of the Council, have been duly considered; therefore,

Resolved, 1. That in the opinion of the American Public Health Association, the present National Board of Health has been of such vast service to the country that it is not expedient to make any essential change in its organization, and that any minor improvement in details should be left to the Board itself.

2. That the investigations which have been commenced by the Board are approved and should be continued, and that similar investigations should be undertaken by it into the consideration and prevention of other diseases, as well as yellow fever.

3. That Congress should appropriate sufficient funds to enable the Board to employ the best talent and apparatus in such scientific and practical inquiries.

4. That the operation of the existing quarantine law, and of the rules and regulations prepared by the National Board of Health on that subject, have accomplished great good, and that no change in the law should be made without the most careful and serious consideration.

5. That in the opinion of this Association, the execution of the quarantine laws of the United States should be under the direction of the National Board of Health and of an executive committee to be selected by that body.

6. That this Association has no suggestions to make with reference to any amendments to existing legislation in regard to quarantine, preferring that they should come from the National Board of Health, as the most competent body to advise whatever may be best.

7. That it is expedient for the National Board of Health to call an international congress for the discussion of the very important subjects of international sanitary quarantine, etc.

8. That it is the duty of the General Government to build, equip and conduct, at the mouth of the Mississippi river, a quarantine station, at such a place as may be designated by the National Board of Health.

9. That the Secretary of this Association be instructed to forward to the National Board of Health a certified copy of these resolutions, together with the reports and documents of the Advisory Council, and that the Executive Committee be instructed to take such action, during the next session of Congress, as may seem best suited to promote legislation in accordance with these resolutions.

Dr. Folsom also read the following resolutions, but said that, as the points contained in them were included in those of the Advisory Committee, they were not recommended for adoption:—

By Judge J. W. Clapp, of Memphis: Whereas, the appearance of yellow fever as an epidemic in Memphis, Tenn., during the last two summers, has created an apprehension that the ill-fated city may continue to be visited by this scourge, the effects of which extend far beyond the infected locality, and assume national importance, not only as regards the public health and safety, but as affecting our inter-State commercial relations; Therefore,

Resolved, That this Association recognizes the fact that the sweeping epidemics which have occurred in Memphis during the past two summers have been of such a character that they are no longer local in their bearings, but *national*; therefore, it is respectfully urged upon Congress the early consideration of measures looking to the prevention of similar epidemics at that point.

By Dr. Gibbs, U. S. Navy: Be it resolved by the American Public Health Association, that it shall be the duty of the National Board of Health to designate, for the information of the President of the United States, such foreign ports as shall, by said Board, be deemed infected, in the sense that all vessels arriving from the same into the seaports of the United States, shall be subject to quarantine laws. The previous sanitary history of said foreign ports, based upon consular and other information, shall be considered by the National Board of Health in designating such infected ports or localities.

Be it further resolved, that it shall be the duty of the President of the United States, upon being so advised by the National Board of Health, to cause a general proclamation to issue, in which a list of such ports and localities shall be declared infected in their commercial relations with the seaports of the United States for a period of six months, viz.: from the first day of May until the first day of November.

Carbonate of Ammonia in Suffocating Disorders.

In the *Medical Biweekly*, Dr. B. H. Riggs speaks favorably of this agent in the suffocative stages of bronchitis of the smaller bronchial tubes (capillary bronchitis, or suffocative catarrh of some authors), and of pneumonia, given in large doses and at short intervals. It is especially useful in these pulmonary complications of the exanthemata. He says:—

My attention was first called to the use of this agent in these disorders by Dr. J. P. Thomas, of Pembroke, Ky. His valuable suggestion has stood me well in hand on some trying occasions. Once, I remember, a fond father came to my office, barely able to articulate, from distress, and asked me to go to his house immediately, as he believed his little son was dying. I had seen the infant, of six months of age, late the preceding afternoon, and had prescribed a purgative dose of castor oil, to be followed by a muriate of ammonia expectorant mixture, the hot foot bath and derivatives to the chest. Early next morning this hasty summons came, and I repaired to the house to find the child suffocating, drowning, from pulmonary engorgement; his head thrown back and spinal column bent backward like a bow, to take pressure off the chest; the face pallid, with a purplish tinge to the cheeks; lips white; nostrils distended; eyes of pearly whiteness; finger nails purple; respiration rapid and panting, and pulse quick, frequent, and feeble; temperature in the axilla, 105°. Here was a case of pulmonary congestion, resulting from acute bronchial catarrh of the smaller bronchial tubes. The treatment adopted to relieve this child was attended with marked success; he is now hearty and well, over fourteen months after his attack. I gave him, a child six months old, two grains of ammonia carbonate, dissolved in water, every two hours, in doses of two grains every thirty minutes' interval, the hot mustard foot bath every two hours, and repeated mustard plasters to the chest. In order to give an infant of this tender age two grains of carbonate of ammonia every two hours, I have found it best to give it in this way: Send to the drug store your prescription for a solution of two grains to the drachm, and direct the attendants to put one teaspoonful of the solution in a wineglass, and add three spoonfuls of pure water thereto, and give the child one teaspoonful of this weakened solution every thirty minutes, by the watch; thus you get the two grains every two hours.

In these distressing cases there is much satisfaction to be obtained by giving the remedy in this way. It is hardly ever necessary to give it longer than twenty-four or thirty-six hours in this way, as this stage of the disease rarely lasts longer than twenty-four hours.

In the congestive stages of acute bronchitis and pneumonia of adults the remedy acts equally well. The average dose for the adult is twenty grains, dissolved in water and taken every two hours. Twenty grains to the tablespoonful of water, added to a wineglassful of water, is not an unpleasant dose.

Posterior Parietal Engagement of the Fœtal Head.

The following, translated from an article by Dr. J. Veit, is taken from the *American Journal of Obstetrics*:—

The diagnosis of this presentation is tolerably simple; the presence of the sagittal suture close behind the symphysis, or the mere existence of a wide expanse of bone (the posterior parietal) without suture at the os uteri, will strike any careful observer. The slighter grades, however, are not so easily recognized, but in such cases an error is not of so much practical importance.

The therapeutical expedients are, rectification, forceps, expectancy, craniotomy and version. The author never succeeded in rectifying the position; even in those of his cases which ended spontaneously, the result was not at all aided by attempts to assist rotation. Rectification must consist either in improving the attitude of the head while yet it is movable above the brim, or in hastening the natural process of engagement. For the former, the manipulation must be essen

tially external; the abdominal wall should be lax, the labor should not have lasted long, and the pains should be moderate. Prolonged attempts of this sort may lose us the favorable moment for version. The second method is more likely to succeed. Backward pressure may readily be made upon the prominent sagittal border of the posterior parietal bone, prominent on account of the great overriding which takes place; but such pressure either fails of the purpose, from the fact that the pains restore the head to its previous attitude, showing that something else is necessary to the engagement than a mere backward movement of the sagittal suture; or else it succeeds at once, producing full engagement, as perhaps the next pain alone would have done. In short, the first method is to be recommended only when the pelvis is exceptionally roomy, the os uteri comparatively small, and the diagnosis made positive early in the labor; the second method is worthy of trial before applying the forceps, and *a fortiori* before craniotomy.

The forceps is to be avoided so long as the abnormal attitude persists, so long, therefore, as the head has still to undergo rotation. After the latter has been accomplished, there is no further objection to the forceps.

In well-marked cases, where the os uteri is sufficiently dilated, version would always be indicated, were it not for the danger of causing rupture of the uterus, by any intrauterine operation, in cases of distention of the lower segment —a danger which is much increased if the distention be unilateral. The indication for version is therefore limited. It should be done early in labor, before the above-mentioned distention has become excessive—never when the latter condition has supervened, even if the os uteri be well open.

Perforation may be resorted to, in the mother's interest, in cases where version is contraindicated, but it should not be performed until the mother's condition plainly demands it.

Indications from the Fœtal Cardiac Pulsations.

In an article in the *American Journal of Obstetrics*, October, Dr. Paul F. Mundé says—

The therapeutical indications to be derived during labor, from irregularities in the fœtal cardiac pulsations, are exceedingly simple. During the normal uterine contractions or labor pains, the placenta is compressed and its circulation more or less interfered with, as long as the pain lasts; naturally the fœtal heart is affected thereby, and its pulsations become, for the time, faint or diminished in frequency, to regain their normal strength and rhythm as soon as the disturbing compression ceases. From this normal intermittent irregularity the fœtus in no wise suffers; should the uterine contractions, however, become so severe, constant, or rapidly recurrent as to continue this depression of the fœtal circulation for some length of time, the fœtal heart sounds do not regain their normal power and rapidity, but grow fainter and fainter, and more and more irregular and infrequent, until they finally cease entirely. This is apt to be the case in the spasmodic condition known as tetanus uteri, and after the use of large doses of ergot during the second stage of labor. The indication to check the excessive contractility of the uterine muscular fibres by narcotics and antispasmodics, and if unsuccessful therewith, to effect the delivery of the child as rapidly as possible, if its life would be saved, is urgently imperative. Further, any constant and increasing irregularity of the fœtal pulsations, during a severe or tedious labor, where the head is subjected to severe and lasting pressure, will demand the speedy extraction of the child, as does also a non-reducible prolapse of the umbilical cord when the child is still alive and its heart shows signs of failing. As the fœtal heart is the evidence of the life and health of the fœtus in utero, it is evident that it should be carefully watched by repeated examinations during every labor, in order to detect and remedy any danger to the child as soon as it occurs.

Hyoscyamine in Epileptic Excitement.

In an article in the *Lancet*, on this alkaloid, Dr. Prideaux writes:—

In the excitement incidental to the epileptic status, hyoscyamine is preëminently useful. It both controls and diminishes the excitement, which is often most furious in its nature, it restricts the time over which it extends, and greatly lessens the number and frequency of such attacks. The following case affords an illustration of the change it produces:—

M. K., a female, forty-six years of age, suffering from epileptic mania of sixteen years' duration. She had attacks of the most violent excitement, lasting about a fortnight, which recurred every three or four weeks, and she was indeed seldom free from them, except for a week or ten days in every four or five weeks. During these attacks she was the terror of the gallery, and frequently was obliged to be secluded during a great part of the time. She would attack any one on the slightest provocation. Her habits were disgusting in the extreme. She would eat her own excrement and drink her own urine, while she had not the slightest regard for decency; tore her clothing to shreds, and her conversation was filthy. She had delusions of various kinds at this time. These conditions of excitement sometimes culminated, though not always, in a succession of fits. About nine months ago, at the commencement of one of her attacks of excitement, she was ordered one-sixteenth of a grain of hyoscyamine three times a day. The effect of the first doses was complete bodily prostration, with all the symptoms of the physiological action of the drug, and entire arrest of the excitement, which, however, returned if the effects were allowed to pass entirely off before a repetition of the dose. She took the medicine (increased to one-eighth of a grain when a certain amount of tolerance was established) for about a month, when she had a violent attack of vomiting, lasting some days, which, however, quickly subsided when the medicine was omitted. A few weeks afterward she was once more threatened with an attack, but a reëxhibition of the hyoscyamine warded it off. On this occasion, also, after persevering with the medicine for some weeks, another attack of vomiting took place. During the past nine months she has only had three

attacks of excitement, which the use of the drug has not entirely warded off; each attack lasted only a few days, and was of a very mild character, so much so that it was remarked by those around her how much she had changed, and what a relief it was. During the whole of this period it was usual to commence giving her one-sixteenth of a grain on the first appearance of the symptoms of excitement; first once a day, gradually increasing to one-eighth of a grain three times a day. At first she was obliged to recur to the medicine every few weeks, and continue for a week or a fortnight, but the periods intervening between the appearance of symptoms of excitement have gradually lengthened, and the last interval has extended over nearly three months, while. after a few doses, she reassumes her natural condition. During the times when she is taking the drug her pupils are fully dilated, and she complains greatly of the dryness of the throat and tongue, and there is frequently some degree of incoherence in the speech. The drug always acts very rapidly, dilating the pupils to their fullest extent, in a short time. There is no doubt but that the drug produced the attack of vomiting, which invariably took place if she continued its use for three or four weeks three times a day; but, beyond the inability to retain food on the stomach for about forty-eight hours, it produced no ill effect. This condition has occurred in several other cases after the continued exhibition of the drug; but it has never produced hæmatemesis, although two such cases are recorded.

Resection of the Elbow Joint.

M. Ollier, in a paper at the French Association, on this procedure, gave the following as the indications for the operation: In young children the operation must be performed only in exceptional cases, because at their age nature possesses exceptional resources, and a case of arthritis in a child is almost always successfully treated by maintaining the limb in an immovable posture, cauterizing it, improving the hygienic surroundings, and regulating the diet. In older children and in adults who are not yet twenty-five years old, it is advisable to perform the operation at once, for the following reasons: 1. The articulation, as a rule, forms again. 2. The patient in most cases gains a strong and healthy member instead of the diseased one, especially if the olecranon afterward grow. 3. Speedy recovery. When the patients are older than twenty-five, it is better not to act rashly, as there is reason to fear that the new articulation may be weak, and consequently useless.

A peculiar diathesis does not necessarily constitute a counterindication to the operation, unless the patient's health has been seriously affected by it. M. Ollier has performed resection of the elbow-joint on a tuberculous woman, who had cavities in the lungs, but this is an exceptional fact. It seems, however, as if in a tuberculous patient the resection of the elbow seemed temporarily to arrest the progress of the pulmonary affection. He held that the operation ought to be performed in all cases of suppurative arthritis. In cases of fungous arthritis, he thought it better not to operate as long as one might hope to preserve the diseased articulation; if this hope failed, he allowed himself to be guided by the patient's age.

Experiments on Disinfectants.

In a recent pamphlet by Dr. J. L. Notter, of the British Army, he relates a number of experiments with various disinfectants.

The facts ascertained (*i. e.*, the results) may be thus simply stated in relation to the agents experimented with:—

Carbolic acid subdued the offensive odor, while the activity of the quite free bacteria is persistent, though diminished.

Chloride of lime destroyed the putrefactive odor and the bacteria themselves, no free bacteria being visible.

Permanganate of potash (Condy) presented similar microscopic characters, but the bacteria seemed to elongate, and torulæ were developed.

The terebene preparations destroyed the odor and precipitated the bacteria in flaky masses, but left some free, isolated, and almost motionless ones in the field.

Very similar characters were presented by M'Dougall's disinfecting liquid—the odor being affected to a very small extent, while the activity of the bacteria, though very slightly diminished, is persistent in the interspaces; while some are precipitated, others appear in the zoogloœa form.

Burnett's fluid acted similarly, but a very slight odor remained.

This abstract may possibly assist medical men, and others, to a satisfactory choice of some disinfectant.

Traumatic Tetanus Successfully Treated with Atropine.

A case of this, in the London Hospital, under the care of Mr. James Adams, is given in the *Lancet*. It was of a blacksmith, wounded over the right eye. The tetanic spasms affected the muscles of the abdomen and back and the flexors of the legs; the chin was drawn down to his sternum, the teeth could not be separated more than a sixth of an inch, and the facial muscles of the left side frequently twitched. No contractions ever occurred on the side of the facial paralysis. The spasms of the spinal muscles were the most intense, so that he had opisthotonos, which lasted with varying degrees of intensity throughout.

Immediately on admission (Jan. 7th) the treatment was commenced by injecting one-sixtieth of a grain of atropia under the skin every four hours. By the 19th the jaws could be opened sufficiently to allow him to take fluids freely from a feeder (he having been previously fed by a tube), but otherwise the spasms were no better. On the evening of the 20th he was delirious; pupils not dilated. He was very violent in the night. Next morning he constantly moved his arms, and seemed to think he was working at his trade. In the night there had been marked opisthotonos, and the house surgeon gave the usual injection of a sixtieth of a grain of atropia, repeating it in two hours, after which he was much quieter. In the periods of remission his abdominal muscles became more relaxed, but toward

evening the symptoms increased in severity; about 6 P.M., and at 10 P.M. the spasms were very severe; temperature 104°. The injections were given at 6, 8, and 11 P.M.

On the morning of the 22d he was much quieter. Temperature 100°. The muscles were still rigid. At 4 P.M. one-fifteenth of a grain of atropine was injected. At 11 P.M. the temperature had risen to 103° F. There was marked increase in the frequency and severity of the spasms. Again a fifteenth of a grain was injected, after which he was quiet for an hour. Later on he became restless, the spasms increasing, and attended with marked opisthotonos. The pupils were not dilated. A fifteenth of a grain was again injected, being three hours after the last. Temperature 105°. Next morning the patient was still restless, and had low muttering delirium and picking at the bedclothes. The pupils were dilated. Temperature 103°; pulse 120; respiration 36. He answered incoherently. The muscles were still rigid, but with much fewer and slighter exacerbations. Altogether, one-third of a grain had been injected within the previous twenty-four hours. Atropine was discontinued.

From this time no more atropine was used. The delirium passed away in a few days. At first the tetanic spasms appeared to increase in severity, but it soon became apparent that the patient was slowly improving. The abdominal muscles, as usual, were the last to relax, but at the end of three weeks the man was practically well.

The Apex Beat of the Heart.

According to Prof. Filehne and Dr. Penzoldt, of Erlangen (*Centralblatt Med. Wiss.*, Nos. 26 and 27, 1879), the usually accepted view, that the apex beat is due to a systolic downward and forward movement of the heart to the left, is false. By their experiments on animals (rabbits, guinea-pigs, and dogs), they believe they have proved that this phenomenon, systolic in point of time, is due to a change in form of the contracted heart, by which it rotates *to the right* and moves *upward and forward*. They explain the difference between their conclusions and those of former observers, Skoda, Bamberger, and others, by the latter having confused systole with diastole, owing to the rapid movements of the heart. Their own method of experimenting is exceedingly ingenious, and obviates this difficulty. After exposing the heart, they irritate the peripheral portion of the vagus nerve, and so diminish the number of cardiac pulsations. The movement which now first occurs after the interval between two pulsations is undoubtedly systolic, and that which immediately follows the first, and is itself succeeded by an interval of rest, is diastolic. By simultaneously irritating the central end of the pneumogastric nerve all disturbance of the experiment by respiratory movements is temporarily abolished. By such observations as Drs. Filehne and Penzoldt have as yet been able to make on the human subject, notably in a woman with exposed heart following pneumothorax, they believe what is true of the above-named animals is true also of man.

Wolfe's Operation for Cataract.

The *London Medical Times and Gazette* states that Dr. Wolfe's method of obviating the risk of failure in cataract extractions is thus noticed in the current number of the *Centralblatt für Practische Augenheilkunde*. In cases of infantile cataract, Dr. Wolfe opens the capsule, and two or three days later he removes the softened lens with a broad needle, rendering, thereby, the use of pumping instruments unnecessary. In senile cataract he makes, two or three weeks before, a narrow iridectomy downward, in such a manner as not to interfere with the ciliary border of the iris. For the removal of the lens he uses speculum, forceps, and Graefe's knife, with which he opens 1‴ more than the third part of the corneal circumference at its scleral border, leaving a narrow bridge. Speculum, knife, and forceps are then put aside, the capsule is opened, the bridge divided with a very small cornea knife, and the cataract removed by soft digital pressure. The use of chloroform is avoided. Traumatic cataracts, when *in situ*, are treated in the same manner: when dislocated forward, they are extracted without iridectomy; when luxated backward, they are brought into the anterior chamber and then removed. We recently had an opportunity of witnessing the elegant performance of this operation, and convincing ourselves of the safety of the method.

Reviews and Book Notices.

NOTES ON CURRENT MEDICAL LITERATURE.

——Dr. Roswell Park, of Chicago, in a neat reprint, presents a conspectus of three different forms of acute inflammatory cardiac disorder, to wit, endocarditis, myocarditis and pericarditis.

——Laryngeal syphilis is the subject of a reprint by Dr. Ethelbert C. Morgan, of Washington, D. C., in which he especially gives the methods of Prof. Johannes Schnitzler, of Vienna, to whom he has recently been assistant.

——The *Proceedings* of the Pennsylvania Pharmaceutical Association contain the Constitution, By-Laws and minutes of the meetings of the Association, and several volunteer papers. An interesting one is a contribution to the history of poisons, by Prof. H. G. Debrunner. Much of it is concerned with the poisons of "the subtle Venetians." Mr. G. W. Kennedy describes the Aspidium Marginale, an indigenous tænicide of considerable efficacy. The value of such an association of intelligent pharmacists will be apparent, and it were well for those in all States to form such connections.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Half-Yearly Compendium of Med. Science,	2.50
Reporter and Compendium, - - -	7.00

Reporter and Pocket Record, - - -	6.25
Reporter, Comp. and Pocket Record, - -	8.25

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,
115 South Seventh Street,
PHILADELPHIA, PA.

THE RELATION OF THE DISEASES OF ANIMALS RAISED FOR FOOD TO THE PUBLIC HEALTH.

As Americans are decidedly a meat-eating people, it behooves them to look closely to the quality of the meat they eat, and acquaint themselves with the result of consuming that which is from unhealthy animals. It is well known that veterinary science in this country is in its infancy, and that public sanitary science is hardly born, at least, in most States of our Union. With all this, hardly a country in the world suffers more from epidemic and sporadic diseases among its animals raised for food. American pork has a bad repute for its trichinæ, and American cattle for pulmonary degradation.

Malignant pustule is not unfamiliar to our stock raisers; and it is worth while quoting an instance to illustrate the disastrous results of consuming the flesh of an animal which was killed while suffering from it. It was an ox, and the account is contained in the *Revue des Sciences Médicales*, for July last. Two hundred and thirty-three individuals were taken ill with violent headache, vomiting, diarrhœa, colic, and syncope. Eight of the patients have since died. Ninety-four persons partook of raw meat; of these, thirty-eight became seriously ill; twenty-nine presented milder dangerous symptoms; and four died. Of fifty individuals who ate the meat stewed, one was dangerously ill, four were less seriously so, and forty-five presented only slight symptoms of poisoning. Thirty persons were taken ill after eating sausages which had been prepared with the blood and liver of the diseased animal; four of these were very seriously ill, three seriously, and twenty-three only slightly indisposed; two died. Twenty-seven individuals ate the meat roasted; eight of these were very ill, and nineteen only indisposed. Three persons were poisoned by partaking of smoked sausage; two of these were dangerously ill. The same meat, salted and then boiled, only produced slight symptoms of indisposition in two individuals.

Not less serious are the results from trichinous pork. A number of cases of poisoning from that source have been recorded during the last half year; several by Dr. WM. MADDEN, in the *Proceedings* of the Kings County Medical Society; five by Dr. E. P. GILPIN, in the *American Practitioner*, of which two were fatal; while in the *Medical Record* Dr. WENDT has shown that a chronic affection of the muscular system can be traced to the same cause. Not less frequent has it been abroad. According to the official documents analyzed by Mr. EULENBERG, there were, in 1877, 172,800 cases of trichinized pork in Prussia. In the district of Stettin ninety-eight cases of disease were observed in man, of which fifty-four occurred in the city of Stettin itself. In the district of Mersburg three small epidemics of trichinosis were observed in villages. Generally, the meat had been consumed slightly smoked, but uncooked. At Hoxter, Westphalia, there were fifty-two cases. To prevent the country from being literally invaded by trichina, the Government has been obliged to have recourse to very energetic measures, requiring every pig which is slaughtered to be certified by an expert

to be free from trichina, after microscopic examination of a portion of muscle. This work is rather severe, and falls rather hardly upon the district medical officers, of whom one alone asserts that he was called upon in two days to examine 503 hams, three tons of lard, and 46 pigs.

It is gratifying to note that the dangers from this source are not overlooked by our medical bodies. For instance, we note that at a late meeting of the Michigan State Board of Health a communication was presented from A. J. Murray, veterinary surgeon at Detroit, relative to "cattle diseases in Michigan," and their relation to public health; also, a part of a letter from a member of the National Board of Health, on a similar subject. These communications were referred to the new standing committee on "diseases of domestic animals as relates to public health," a committee from which we hope a full and careful report will be forthcoming in time.

The interest of the National Board of Health in the subject will, no doubt, be fruitful of good results. It has the facilities for thorough investigations, and will, doubtless, apply them, with excellent advantage to the people.

LEGISLATION FOR INEBRIATES.

There is in England a "Society for Promoting Legislation for the Control and Cure of Habitual Drunkards." Its objects are to secure the enactment of statutes under which confirmed and habitual drunkards can be sent, by municipal and other local authorities, to "retreats," or institutions especially designed for this class, where they will receive regular and appropriate treatment.

The objections which have been urged to these aspirations are that such enactments encroach on individual liberty, which is so dear to all English speaking people; that they would be liable to abuse, for the sake of gain; that they involve the maintenance of large and costly institutions; that confirmed inebriates are almost never really "cured" by treatment in such institutions; that owing to domestic inconveniences such laws would be but partially taken advantage of; that drunkenness is a moral perversity, and ought to be met by moral and religious teaching rather than physical restraint; that the diagnosis of "habitual drunkenness" is vague and uncertain; and the like.

It is not worth while to do more than mention these various objections. Their consideration is occupying the attention of specialists of this branch in most civilized countries. The importance of taking some active steps to foil "the demon intemperance" is very generally recognized.

There are not wanting enlightened and thoughtful men in this country who have espoused the cause with enthusiasm; and were the powerful temperance organizations which flourish among us enlisted in the struggle, we should not wait long to see such enactments spread on the statute books. The editor of the *Quarterly Journal of Inebriety* says, in his last issue—

"The time has come for an intelligent recognition of all the means of relief. Every town and city is menaced by an army of inebriates, who are rushing down to ruin, breaking up all order, morals and industry, and leaving entailments of disease and degradation that centuries cannot eradicate.

"The great principle of self protection must be recognized practically in this statement, that whenever a person habitually fails to exercise self-control in the use of alcohol and other narcotics, he is either a dangerous person or a public nuisance. It is the duty of the authorities to take care of such men, to protect them and society from the consequence of their excesses. They should be isolated in asylums, the same as in cases of infectious diseases, and if to this can be added means of self support, it is demanded, as a measure of the highest wisdom and economy to all.

"Inebriety must be regarded as a physical disease, if we would understand the hidden forces which govern its march along the lines of civilization."

This last sentence is not quite clearly expressed. In physical diseases we do not forcibly shut up patients; rather let us say that the inebriate suffers from a mental disease, that he is of alienated mind, in the eye of the law, *non compos mentis*. True enough, that advanced alienists claim mental disease as merely a sign of cerebral pathology; but we now use terms in their ordinary and legal senses.

As a dangerous person, the confirmed drunk-

ard should be isolated, less for his own benefit than for the safety of those around him, less as a means of promoting temperance than for the protection of the social state. The excuse for every violent encroachment by government on individual liberty, it must always be borne in mind, is not "to make an example," nor to reform, but solely to protect the well doing in their legitimate pursuits. As the occasional inebriate, when "drunk and disorderly," is forthwith shut up in the station house until he grows sober, so the constant inebriate, who is drunk and more or less dangerous substantially all the time, should, with like legality, be put behind the bars for a much longer time. Take the instance of a woman, a girl, or a wife and mother who is an habitual sot; what disgrace and destruction to herself and her family she may work! Yet no one has the strict legal power to remove her from the temptation she cannot resist. If she is of good family, a point will be stretched, and she will be sent to a private asylum, on a certificate of insanity; but if poor, she will drag down with her all her family. What physician of extended practice cannot recall various examples of this kind? They call loudly for action by the properly constituted authorities.

Notes and Comments.

Therapeutical Notes.

TO RELIEVE ITCHING.

℞ Acidi carbolici, gtt. x
Glycerinæ, ℥ j
Aquam, ad ℥ j. M.

Sig.—To be used in an atomizer, five minutes at a time, several times daily.

This is used by Dr. Rigaut, of Paris, in itching from all causes, in lichen, eczema, prurigo, etc., and with very general success wherever the irritation is nervous rather than mechanical.

FOR EXTERNAL PILES.

℞ Unguenti gallæ comp.,
Extracti belladonnæ, āā equal parts, M.

Dr. David Young, of Florence, says, in the *Practitioner*, October, that of all the plans which he has adopted, none have yielded such satisfactory results as the following, viz.:—

To bathe the part thoroughly with water, as warm as can be borne, together with the free use of Castile soap, and afterward to apply the above ointment. The operation must be repeated every three or four hours, till the pain subsides. Usually the first application gives great relief. Without the previous bathing with soap and warm water the application of the ointment is of little service.

ENEMA FOR DYSENTERY.

When ipecacuanha cannot be given by the mouth, Surgeon W. G. King says, in the *Lancet*, he has derived the greatest advantage from the following:—

℞ Bismuthi subnitratis, ʒ ij
Tinct. opii, ♏ ss
Pulv. ipecac., ʒ ij
Mucilaginis, ℥ iij. M.

Sig.—For an enema, to be thrown up after first gently cleansing the bowel by an enema of lukewarm water.

PICROTOXIN IN NIGHT SWEATS.

In doses of $\frac{1}{120}$ to $\frac{1}{60}$ of a grain, Dr. William Murrell found picrotoxin to arrest the night sweats of phthisis, in nineteen out of twenty cases. He gave the dose mentioned in simple aqueous solution, at bedtime (*Practitioner*, Oct., 1879).

How to Select a Hypodermic Syringe.

The following advice on the selection of a hypodermic syringe is given by Dr. W. S. Greenfield, in the *Lancet*:—

First of all, to fulfill all the conditions, it is essential that the needles should be fine, with a grooved and very sharp point, that they should be made of polished steel, and that they should be kept well tempered and scrupulously clean. The syringe should be rather large, made of glass, with metal fittings, and the piston always well soaked. The junction of the needle with the syringe must be thoroughly air-tight. It is essential that the operation of puncture should be as nearly as possible painless, that we may be able to tell the patient that it is less than a pin prick, and justify our statement. The needles should not be less than one and a quarter, nor as a rule, more than one and three-quarter inches in length. The diameter should not exceed one millimetre. These details are not unimportant, for a very large number of common hypodermic syringes do not fulfill these indications, and they are essential if the pain is to be reduced to a minimum. Where it is desirable only to remove a moderate quantity of fluid, from one to one and a half ounce (even a smaller quantity may sometimes be removed in empyema of infants with advantage), one may employ a larger syringe, holding about an ounce, which is screwed on to the needle *in situ* after screwing off the small syringe.

Why Hebrew Reads from Right to Left.

Most Aryan nations write from left to right; most Semitic nations from right to left. A physiological reason for this has not heretofore been suggested. Dr. Erlenmeyer proposes a very simple one, to wit, that the ancient Semites wrote with the left hand, and as the only convenient way of writing is by a movement of the hand *from* the body, a right-handed person will naturally begin at the left side of the page, while a left-handed one will begin at the right side of the sheet. Not only does Dr. Erlenmeyer propose this, but he has come upon evidence in proof that this was the case. In a passage in the Talmud, it is enjoined that certain inscriptions of prayers should be written only with the right hand. Hence, it has very justly been assumed by commentators that these inscriptions were written commonly with the left hand. Dr. Erlenmeyer might have adduced the evidence which is to be gleaned from the Hebrew books of Scripture in support of the theory of original Hebrew left-handedness. By both Jacob and Job pre-eminence was given to the left hand. The former, we are told, "wittingly" placed his left hand on the head of his eldest grandson. And other examples could be quoted.

Relation of Impure Milk to Infant Mortality.

In an article in the St. Louis *Courier of Medicine*, Dr. P. V. Schenck makes the following forcible observation, which ought to attract the attention of all sanitarians:—

From the statistics which I prepared as Health Officer, in 1874–5, it is clearly shown that in cities where swill-milk is sold and in-town dairies allowed, the infant mortality is by far the greatest. The infant mortality is greater in the West than in the East, greater in the cities than in the country, greater in cities surrounded by grain-growing districts, greater in proportion to the number of distilleries, and greater in proportion to the use of swill food. The healthy city of Milwaukee, where we would think our children should be sent to avoid the enervating effect of high summer heat, looms up with an infant mortality of sixty-one per cent.

Confidential Communications to Physicians.

The public weal would be consulted by all States passing statutes protecting physicians who decline to reveal professional confidences. Dr. W. F. Sandford, of Brooklyn (*Proceedings* of the Kings County Medical Society), says there is in New York a statute intended to cover this point. When a physician in that State is called to testify as to any such confidential disclosure he must plead his privilege. He must bear in mind that it is the privilege of his patient, rather than his own, and it can be waived only by the express consent of the patient. It has been decided that it does not survive the decease of the patient, and hence cannot be raised in regard to the capacity to make a will, upon a question of probate. The following are not considered confidential communications within the meaning of the law:—

(*a*) Communications made before employment as a physician, or after such employment ceased.

(*b*) Where, being consulted as a physician, the doctor refuses to act as such, and hence is applied to only as a friend.

(*c*) Where a fact merely took place in the presence of the physician.

(*d*) Where the matter communicated could in no sense be considered in its nature private.

The Physician's Pocket Record and Visiting List.

The excellent *Pocket Record* arranged by the late Dr. S. W. Butler has been brought out this year thoroughly revised, with new stereotype plates, a posological table, in both the apothecary and the metric systems, additional matter of various kinds, and bound in American Russia, with a patent spring clasp. All who have used it before cannot fail to be pleased with these improvements; and those who have not are invited to make a trial of it. A leading advantage in its arrangement is that entries can be commenced at any time in the year, and one whole year's entries can be made from any date. For sale at the office of this journal.

The Relation of Intemperance and Temperance to Violent Deaths.

A paper before the last meeting of the British Social Science Association stated that "it was significant that Italy, a most temperate nation, had annually only 240 per million of violent deaths, while England, an intemperate nation, had 757 per million."

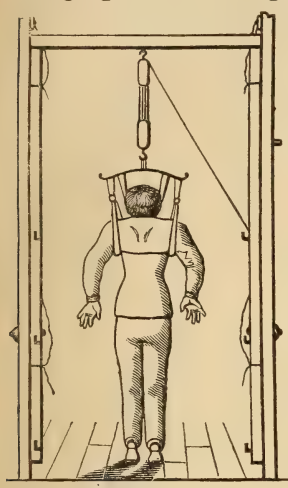
It doubtless is significant, and no question that to intemperance is chiefly due this difference; but it is the reverse of an argument for teetotalism, as the Italians drink large quantities of wine; indeed, it takes the place of tea and coffee, and almost of water in most localities. It is a strong argument for light, pure wines, and this interpretation should not be concealed by temperance reformers.

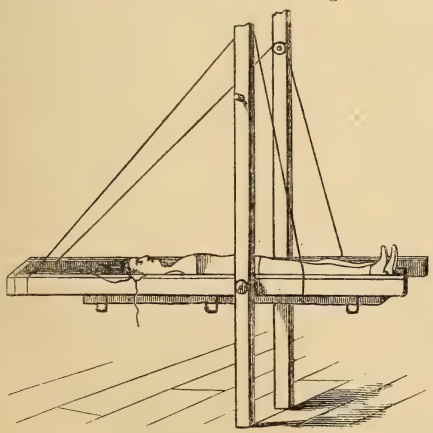
Correspondence.

Method of Applying Fixed Bandages in Spinal Affections.

Ed. Med. and Surg. Reporter:—

No doubt every one who has applied plaster of Paris or silicate bandages has had more or less trouble in laying the adult patient down after the bandage has been applied, to prevent shoving together the bandage, or misplacing it, thereby rendering the jacket useless, if not painful to wear. Having experienced the above difficulties and uncertain results, I have invented a frame to suspend the patient in while applying the bandage; after which a belt is attached to the inside frame, behind the patient, and the whole let down by pulleys, keeping the patient stretched until in a horizontal position; then the pulleys on the head and shoulders are loosened. The patient lays comfortably upon the couch until the jacket is hard enough to set him upon his feet. The wood cuts represent the frame while the jacket is being applied and after the patient is laid down. There are two frames, one within the other, bolted together, about thirty inches from the floor, leaving the inside frame free from the floor so as to turn upon the bolts on either side; it is kept in a perpendicular position by a pin through both frames, or uprights. The outside frame is fastened to the ceiling and floor.





It will be observed that iron bars, with a hook, are attached to the movable frame, to place the cross bars or slats of the bed upon. This apparatus is very simple, and easily controlled; the patient can be laid down in a few seconds, in case of sickness or fainting, as frequently occurs with patients not accustomed to being suspended, and then drawn up again, and the jacket finished. I have found this frame to be of great service to me, and therefore I present it to the profession for their inspection, and will be glad to have them test it, practically, if they wish.

D. R. Greenlee, M.D.

Meadville, Pa.

Obscure Convulsive Disorder in Infants.

Ed. Med. and Surg. Reporter:—

Having recently had several cases of an obscure character in my practice, I send you a description of one of them

Oct. 4th, at night, I was called to see an infant female child of Mr. Harris, a neighbor. I found it with breathing almost suspended, hoarse respiration, pulse almost imperceptible, with great palpitation of the heart; its bowels tympanitic and costive; its skin moist, but clammy; its eyes set, only closing them once in five minutes. When put to the breast, it would take hold of the nipple and suck greedily for a moment or two, and then suddenly throw its head back with great violence; at the same time strong spasmodic jerkings of the left hand and foot would set in. There was also spasmodic twitching of the right side of the face, with a drawing to the right of the head. Occasionally it would take a spell of hiccup, and then the croupous and rattling noise in the trachea would supervene. Its thumbs were firmly and tightly grasped on the palmar surfaces of the hands by its fingers. Its big toes were also tightly drawn down and inward on the anconal aspect of the metacarpus, left hand, and on the rotular aspect of the metatarsus of the left foot a remarkable tumor was visible, having a considerable degree of roundness and elevation. These tumors had a livid, mottled or purplish color, and did not pit on pressure or pain the child; in fact, it did not seem to have any feeling whatever. We gave it a warm bath of five minutes, rubbed it dry, wrapped it in flannel, laid a blister on the nape of the neck, and one behind each ear: rubbed the spine with chloroform and laudanum liniment; gave an enema of oil of turpentine, starch and water, and by the mouth castor, oil ½ oz.; croton oil, 1 drop; calomel, 5 grains. This treatment was all done at 1 o'clock that morning. At 4 o'clock following the bowels acted twice, with very large, dark, jelly-like discharges, very offensive, with a few pieces of worms. At 4 o'clock, we gave it quinine, 10 grains; Dover's powder, 10 grains; calomel, 5 grains; bismuth subnitrate, 30 grains; to be made into 10 powders; one every two hours; warm bath to be repeated every five hours. With all this, it was to have lime water and milk, with weak toddy every hour or two. It had been having diarrhœa, with white, watery discharges.

The history of the case was this: At birth the child had these spasmodic jerkings of the left hand and foot. The old woman midwife told me that when the head and arms of the body were

barely through the vagina, she discovered the jerking of the shoulder and arm, and that the jerking of the hand and foot was so great that she was compelled to have assistance in tying the cord—some one to hold the child. In other words, the spasm continued for three days and nights. They bathed it in warm water, and put salt in its mouth, which checked the spasms, as they claim. From that time until the first of October last the child had pretty fair health, but on October 1st its bowels began to run off, and nothing would check them, the old woman said, until they stopped themselves, on the 4th. On that night the child awaked its mother with the croupous rattling in the windpipe, and the spasms of hand and leg. They believed the child had croup, and sent for me. I found it as above, and not understanding perfectly the case, I did what I thought best, and the treatment we gave seemed to do good; at least, as soon as the bowels moved two or three times it was quiet, breathing easier and freer; spasms suspended; eyes closed, and the heart did not palpitate so fast. We continued the bath every five hours, with powders of quinine, calomel, Dover, and bismuth, every two hours; milk and lime water, with toddy, every two or three hours.

On the evening of October 5th I saw it again; it was doing well, apparently, had taken most of its medicine, with considerable nourishment. Breathing free and regular; bowels moved three times since the morning of the 4th; discharges still black or greenish in color, and gelatinous in consistency; skin warm and moist; kidneys acting well; eyes looking normal; no spasm of foot or hand; would take the breast and suck freely. I continued the quinine, Dover, calomel and bismuth, with directions to give castor oil and turpentine next morning, if the bowels did not move any more till then.

On the morning of the sixth I saw it again. I found all the old and bad symptoms redeveloped. No action from the bowels since the morning before; skin cold and clammy; pulse imperceptible; heart palpitating terribly; eyes staring; spasm of left hand and foot bad; one jerk after another, in rapid succession; head thrown back and to the right, with now and then general spasm of the whole body, drawing the body in a complete bow, resting on the back of the head and heels, opisthotonos in full; breathing only once in two or three minutes, and when it did get a breath it was with a long-drawn sob or sigh. The tumors of the metatarsus and metacarpus were redeveloped also. We bathed its feet and legs in hot water; applied cold cloths to the head; gave bromide potass, five grains; bromide ammonium, five grains; chloral hydrate, five grains, every three hours, in simple syrup; half ounce at a dose. We cupped the spine, with blisters between the shoulders, but to no avail. It died at 8 o'clock P.M., on the evening of October 6th, 1879.

The above is the third case of the kind which I have treated. The other two cases were almost exactly like this one, only not born with the carpopedal spasm, and they both got well, and are now hale and hearty children. They were treated as the above; gums lanced well; both blisters and purgatives, strong ones at that, followed by sedatives. Should this be called carpopedal spasm, or a spasmodic affection of the chest and larynx in young children, accompanied with general or partial spasms or convulsions? DR. DAVIES.

Roxton, Texas.

Dr. Carpenter, the Sanitarian.

ED. MED. AND SURG. REPORTER:—

You very naturally, in your reference to Dr. Carpenter, at the Sanitary Congress at Croydon, confounded two very distinct yet valuable physicians. Dr. Alfred Carpenter, Lond. C.S.S., Camb., who was the most efficient agent in the Congress, is a gentleman of high acquirements as a naturalist and sanitarian; he is also the President of the Council of the British Medical Association; he was long connected with St. Thomas' Hospital, and after serving this old and valuable institution for many years, was invited to Croydon, where he has a most select practice, with two assistants; he is also a magistrate. For years he has given much and careful attention to the sanitary condition of Croydon, which has grown from a few to sixty thousand inhabitants, and by his persistent and watchful attention has entirely done away with epidemic typhoid fever, which prevailed, and was owing to the impurities in the water supplied to the tenement houses by improper plumbing and the penurious character of the landlords. At one time he created so much enmity that, at their instigation, the Doctor was burned in effigy; yet nothing deterred him from his philanthropic labors, and he was ultimately successful in having a proper ordinance passed, by which each family was supplied with pure water.

Dr. Alfred Carpenter is an admirable public speaker, and is always ready to say the proper words in the proper season. He is the balance wheel of the British Medical Association, and by his aid and judicious counsels produces peace and harmony in this large and useful Society.

He is the author of a very useful volume, which, I am sorry to say, is not well known in this country; it is entitled, "Preventive Medicine in Relation to Public Health; being Lectures and Addresses delivered at St. Thomas' Hospital, and elsewhere."* They are suggestive rather than exhaustive in their character, and are intended to direct the workers in sanitary science as to the lines they should pursue. One of the most useful papers is "on the power of soil, air and vegetation combined to purify sewage." There are also some very practical observations on the management of sewage farms, a subject which should excite the interest and active co-operation of the practical sanitarians of our city. Dr. Carpenter has also published several pamphlets on various other sanitary and medical subjects, and his lecture before the late Congress is replete with carefully collected facts on sanitary progress. It is published in full in a recent number of the *British Medical Journal*, an abstract of which I hope you will give for the benefit of your numerous readers.

Philadelphia. L. TURNBULL, M.D.

* London, Simpkin, Marshall & Co., 1877, pp. 367.

News and Miscellany.

Sir Thomas Watson, M. D., on Animal Vaccination.

On the subject of vaccination with bovine virus, the eminent London physician, Sir Thomas Watson, writes to the *Pall Mall Gazette:* "Several letters have lately appeared in the *Times* newspaper, respecting what is called animal vaccination. In one of the numbers of the *Nineteenth Century* vaccination on and from the calf was earnestly advocated by me, as carrying with it the potential extinction of the only valid objection that can be alleged against vaccination in general; and justifying, therefore, the needful compulsion of vaccination by force of law. The anti-vaccination party have attempted to enroll me among the writers who have adopted their views. I ask leave, therefore, to inform you and your readers that my sole object has been, and is, to prove that by vaccination, properly and universally effected, the hideous, disfiguring, dangerous, and in a great majority of cases fatal distemper, smallpox, may with certainty be extirpated from this country—I might say from this world."

The Nuisance of Inset Advertisements.

A prominent physician of this city writes us—"In reference to 'A Nuisance,' in to-day's issue (Reporter, p. 460), may I state that in complaining of it personally to one or two editorial friends, I was met with the reply that 'it is the advertisements, and not the subscribers, that pay for the journal.' The cause of the nuisance is evidently not in the interests of medical literature."

As the primary object of a periodical—at any rate, of a scientific journal—ought to be the interest, convenience and advantage of subscribers, we suggest to them that they notify such editors that unless this annoyance of inserting advertisements among the reading matter is stopped, their subscriptions may be expected to end.

Syphilis in Russia.

Syphilis, says Dr. Podolinski, is the principal scourge of the rural populations of nearly all Russia, but its ravages are greatest in the South, in the Governments of Kiew, Poltava, and Theringnon. In some of the villages a third of the inhabitants are contaminated. In Taroslawka, of 120 families, 30 are certainly syphilitic, and 64 only are *known* to be healthy. The influence of the disease on the degeneration of the population and the increase of mortality is very great. There is scarcely an example of a member of an infected family having passed the age of sixty, and the death-rate among the syphilitic is more than one-half greater than that of the remaining population.

Reception to Surgeon General Wales.

A reception to Surgeon General Wales, U.S.N., was given on the evening of Nov. 20th, by Dr. William A. Hammond, late Surgeon General U.S.A., at the latter's residence, in New York city. A large number of gentlemen prominent in social, military and literary circles were present, and the evening was spent in the most enjoyable manner. Dr. Wales' appointment is an excellent one, and although it has given rise to some feeling in certain quarters, it is indisputable that the efficiency of the service was well consulted when he was chosen.

Staufer's Uterine Instruments.

The valuable series of uterine instruments, including pessaries, supporters, sounds, specula, examining case, etc., made in hard rubber, by the above mentioned inventor, have now stood the test of a number of years' trial by many physicians, with most satisfactory results. Of many favorable opinions, we may quote one just received from Dr. L. Van Bender, of New York. He writes: "I have tried almost all kinds of uterine appliances during a practice of over twenty years, but have not found anything in the shape of a supporter that gives more perfect satisfaction than yours. I am also very much pleased with your examining case."

From our own experience with the hard rubber appliances we can endorse this praise as well merited in every respect, and can recommend them, without reserve, to the profession.

Personal.

—Mr. Erasmus Wilson, the English specialist on diseases of the skin, is about to give $100,000 to erect a sea bathing infirmary for the scrofulous. It will be remembered that he paid for the erection of Cleopatra's needle in London.

Items

Correction.—Dr. W. G. Carter, of Richmond, writes us that the ℞ for gleet (Reporter, p. 436) should be made up with *Chio turpentine*, instead of the ordinary oil of turpentine, as given by us.

—The sanitary inspection of steamboats on the Mississippi and its tributaries, urged by the National Board of Health, has met with the hearty approval of the principal municipalities along those streams.

—A pretended case of arsenical poisoning from a dental filling is reported from West Chester. A homœopath and an Indian herb doctor pronounced it such. The patient, in fact, died from Bright's disease.

—In the University of St. Petersburg 77 women have entered, this winter, as medical students; 14 have joined the London School of Medicine for Women, making 37 in attendance there.

—Several persons in New York city were lately taken ill after eating "lemon meringue pie." The symptoms were not unlike those of bilious cholera, and some of the sufferers said that they felt "as if they were on fire inside." One of the victims died. It is supposed to have been owing to a poisonous flavoring material.

—At St. Petersburg, phthisis, which fifty years ago held the fourth or fifth place on the bills of

mortality, has now outstripped all other diseases, and takes the first rank. Whether this is owing to the relative diminution of preventable diseases (smallpox, typhus, etc.,) or to an actual increase in tuberculous cases, we are not informed.

—It is estimated that where physicians are in the proportion of one to two thousand inhabitants, medical men can make a respectable living. In the United States, it is alleged that there is one practicing physician to every 600 inhabitants. Isn't this significant to young men deciding on their vocations?

—Forty-four and four-tenths per cent. of the white people who took the yellow fever during the late epidemic in Memphis died; of the black people sixteen and six-tenths per cent. died. There were altogether 1537 cases of fever and 487 deaths, a total death percentage of thirty-one and six-tenths.

OBITUARY NOTICES.

—Dr. French Weems died, at the residence of his daughter, in Louisville, Ky., last week. He was born in Prince William county, Va.,in 1797, and passed his childhood in that State. He graduated a physician in New York, and practiced his profession there a few years before removing to Louisville. On the occasion of the departure of General Lafayette for home, from New York, Dr. Weems delivered a complimentary address. His father, Dr. John Weems, was a consulting physician during the last illness of General George Washington.

—Dr. Henry F. Quackenbos died, a few days since, in New York city. He was born in 1817, received his diploma in 1840, entered the French service in Algeria, and subsequently practiced in New York city.

—Dr. John A. Brown, of Bellefontaine, Ohio, died, of heart disease, while out hunting, November 23d. His body was found by his friends, after a long search. His dog had remained by its dead master, and worn a path around the body while keeping guard.

—Dr. Freeman J. Bumstead, well known as a prominent physician, and author of the standard work, "Bumstead's Pathology and Treatment of Venereal Diseases," died, November 28th, of dropsy. He was born in Boston, April 21st, 1826; was graduated from the Harvard Medical School, in 1852, studied for three years in Paris, and since 1855 has practiced in New York city.

QUERIES AND REPLIES.

Dr. W. H. K., of Illinois, asks:—Are tinctures made from fluid extracts as reliable as those made according the U. S. P.?

Ans.—We have inquired of pharmacists as to this, and they assert that when made from standard extracts, the tinctures are just as good; we confess that tinctures from fresh leaves, when so ordered, would, in our opinion, be more likely to hold in solution the active principles, than those from extracts.

Pharmacist.—The *Batiator* root, about which you inquire, was suggested last year, by Dr. Stanislaus Martin, as a substitute for ipecac, in dysentery. We believe its botanical position has not been defined.

Dr. Haller, of O.—The caul is that portion of the membranes which occasionally covers the head of a child at birth. Cauls are still dried and sold as amulets or charms, and advertisements of them may not rarely be seen in Philadelphia papers.

Vaccinator.—Bovine Virus should always be used where there is the least suspicion of disease in the child from which vaccine matter is taken. Otherwise, you might expose yourself to an action for damages.

Franklin.—There are private establishments in this city where ladies can be boarded and attended to during confinement. For particulars, you should apply by mail, inclosing postage stamp for reply.

MARRIAGES.

FRENCH—WILSON.—On Wednesday, Nov. 19, by the Rev. W. T. Langford, Thomas R. French, M.D., of Brooklyn, and Helen M., daughter of the late John A. Wilson, of Elizabeth, N. J.

MAYHEW—CHAMBERLIN.—Monday evening, November 10, by the Rev. Henry Tuckley, at the residence of the bride's father, Delhi, O., Miss Helen E. Chamberlin, only daughter of J. V. Chamberlin, Esq., and Dr. George S. Mayhew.

McFARLAND—SIMCOX.—By Rev. D. A. Newell, at the Presbyterian Manse, Clarksville, Pa., Oct. 16th, L. R. McFarland, M.D., and Miss Mary E. Simcox, both of Transfer, Pa.

MULLER—HULL.—On Wednesday, November 19, at Christ Church, Oyster Bay, Long Island, by the Rev. George R. Van De Water, Richard W. Muller, M.D., of New York, and Alice, third daughter of Richard Hull, Esq., Hillside, East Norwich, Long Island.

NEEL—BROWNING.—On Oct. 28th, by the Rev. T. A. Nelson, of Brooklyn, H. A. P. Neel, M.D., of Titusville, N. J., and Miss Clara E. Browning, of Brooklyn, N. Y.

O'NEILL—CHANDLER.—On Thursday, November 20, at St. James Church, by Rev. Henry J. Morton, D.D., assisted by Rev. W. Neilson McVickar, J. Wilks O'Neill, M.D., and Florence Emilie, daughter of William Penn Chandler, all of this city.

RANKIN—VOORHIS.—On Tuesday, Nov. 11th, at Trinity Chapel, New York City, by the Rev. Thomas G. Peters, D.D., Dr. Francis Huntington Rankin, of Newport, R. I., and Grace, daughter of the late Jacob Voorhis, Jr., of New York City.

TROUT—COOPER.—Oct. 21st, by Rev. J. Mateer, D.D., Dr. D. P. Trout, of Leechburg, and Miss Mina, second daughter of John Cooper, Esq., of Cochran's Mills, Armstrong Co., Pa.

WILLIAMS—CAREY.—At the residence of the bride's parents, No. 256 Everett Street, Cincinnati, Ohio, by the Rev. Thomas Lee, assisted by Rev. D. H. Moore, D.D., David T. Williams, Esq., and Miss Mollie T. Carey, daughter of Dr. M. T. Carey, all of this city.

DEATHS.

BALFOUR.—In this city, on the 20th ultimo, Dr. Gilbert Balfour, aged thirty-six years.

BROWN:—On Nov. 7th, Dr. John Brown, brother of Dr. Charles D. Brown, No. 251 West 23d St., New York.

HENRY.—In Everett, Pa., October 4th, Dr. James Henry, aged seventy-six years and six months. At evening time it was light.

HILDENBRAND.—In this city, on the 18th ult., Mary Elizabeth, beloved wife of Dr. Louis William Hildenbrand.

HOMEYARD.—On Thursday evening, Nov. 20, at the residence of his son-in-law, Charles E. Lawrence, New Brighton, Staten Island, John C. Homeyard, M.D.

LEVY.—In Trenton, Tennessee, on the 14th ultimo,, with serene resignation and holy faith, Louis Levy, M.D., oldest son of the late Lewis and Ann Levy, of this city.

HORSFORD'S
Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges.

MANUFACTURED BY THE

RUMFORD CHEMICAL WORKS,

1155-1206 PROVIDENCE, R. I.

DE DUDLEY'S EMULSION DE
OF PURE
NORWEGIAN COD LIVER OIL
PANCREATINE
AND
DE LACTO-PHOSPHATE OF LIME DE

FORMULA.—Each fl. oz. contains six grs. of Pancreatine, sixteen grs. of Lacto-Phosphate of Lime, twenty-five per cent. of Glycerine, and **fifty** per cent. of Norwegian Cod-liver Oil.

THE ONLY PANCREATIC EMULSION MADE IN THE UNITED STATES.

This preparation is respectfully submitted to physicians as being **always** reliable. Although well aware that Cod-liver Oil Emulsions have fallen into deserved disrepute, yet we are confident this will stand any test or trial it may be subjected to. It contains no GUM ARABIC, TRAGACANTH, ALBUMEN, SACCHARINE OR ALKALINE MATTER; therefore, it will not SAPONIFY, FERMENT nor RANCIDIFY. The addition of **Pancreatine** insures rapid and complete assimilation, enabling patients with very weak stomachs to easily retain and digest it.

Guaranteed to keep in any climate. Physicians supplied with samples (express paid) on application.

DUDLEY & CO., Pharmaceutical Chemists,

Laboratory, 397 and 399 Pearl Street. **423 Fulton Street, Brooklyn, N. Y.**

MESSRS. DUDLEY & CO.: *Dear Sirs*—Though your EMULSION has not been before the profession a long time still I have used it quite extensively in my practice, and can truly say I think it one of the most elegant preparations of Cod-liver Oil I have ever prescribed. I find it can be readily taken and borne by the most delicate stomach, and the PANCREATINE and PHOSPHATES make its administration desirable in a large number of cases other than phthisical. In fact, there are few cases of mal-assimilation and general debility in which its administration will not do good; and it gives me pleasure to recommend it to my professional brethren.

1179- HOMER L. BARTLETT, M.D., Brooklyn, N. Y., Consulting Surgeon Kings County Hospital.

NEW REMEDIES.

FLUID EXTRACTS.

Coto Bark.—From BOLIVIA. Almost a specific in acute and chronic diarrhœa, cholera, cholera morbus, etc.

Cascara Sagrada.—(**Rhamnus Purshiana.**) From the PACIFIC SLOPE. A certain remedy for habitual constipation; and very useful in all cases where a laxative or cathartic is indicated. Beware of the fluid extracts of spurious varieties of this bark.

Folia Carobæ.—From BRAZIL. A powerful alterative, which exerts a marked curative action in syphilis, scrofula and kindred disorders.

Rhus Aromatica.—A remedy in diabetes, and other diseases of the genito-urinary organs.

Damiana.—(**Turnera Aphrodisiaca.**) From MEXICO. The best known aphrodisiac. Of great value in impotence, spermatorrhœa, and loss of sexual appetite.

Boldo.—(**Peumus Boldo.**) From CHILI. The new tonic. Very useful in dyspepsia, hepatic torpor, yellow fever, etc.

Berberis Aquifolium.—From CALIFORNIA. Has marked alterative and tonic powers, and has been used with extraordinary success in salt rheum, psoriasis, eczema, scrofula and syphilis.

Black Haw.—(**Viburnum Prunifolium.**) From the UNITED STATES. Employed to prevent abortion and miscarriage.

Grindelia Robusta.—From CALIFORNIA. A valuable curative agent in asthma and diseases of the air passages.

Grindelia Squarrosa.—From CALIFORNIA. Anti-malarial. Used in enlarged spleen and other malarial diseases.

Cereus Bonplandii.—(**Cereus Grandiflorus and Cereus McDonaldii.**) From MEXICO. Heart sedatives. Very useful in controlling functional and organic disturbances of the heart.

Kaki.—(**Diospyros Kaki.**) From JAPAN. Peculiar action on the mucous surfaces. Useful in mucous dyspepsia, typhoid fever, etc.

Cercis Canadensis.—Indigenous. A positive remedy in chronic diarrhœa, dysentery, etc.

Jaborandi (diaphoretic). **Guarana** (sick headache). **Fucus Vesiculosus** (anti-fat).
Bearsfoot (enlarged spleen). **Coca** (nervous stimulant). **Kava Kava** (Gonorrhœa).
Eucalyptus Globulus (antiseptic and anti-malarial). **Yerba Santa** (coughs).
Yerba Reuma (catarrh). **Wood Betony** (dyspepsia). **Ustilago Maidis** (oxytocic).
Penthorum Sedoides (catarrh). **Soap Tree Bark** (tooth wash).

CRUDE DRUGS.

Goa Powder (ringworm and diseases of the skin). **Gurjun Balsam** (a substitute for Copaiba).
Alstonia Constricta (a substitute for Calisaya).

SUGAR-COATED GRANULES.

Calcium Sulphide 1-10 gr. (for the cure of boils and carbuncles).

Our limited space prevents our describing in detail the history and application of each remedy, but to those interested in NEW REMEDIES, we will say, that we can furnish interesting information relative to the above new drugs.

PARKE, DAVIS & CO.,

DETROIT, - MICHIGAN.

Our New Remedies can be procured of the Drug Trade throughout the United States. By specifying **"P., D. & Co.'s"** in all cases, you will ensure reliable preparations of the **true drugs.**

LAWTON'S

ABSORBENT COTTON

FOR

HOSPITALS, DISPENSARIES, PHYSICIANS, DENTISTS, DRUGGISTS, PHOTOGRAPHERS, ETC., ETC.

The article furnished by us will be found superior to any other, on account of the facilities we possess for the manufacture, and the care taken at every step of the process.

Not only in general surgery, but especially in gynæcological practice, Absorbent Cotton has found great favor. It differs little from ordinary cotton in appearance, except in its uniformly fine quality and pure white color, freedom from all impurities — being entirely cleansed from oil, resin and all foreign matter.

The property of instantly absorbing liquids, its exquisite softness and great cheapness render it an invaluable substitute for Patent Lint, Charpie or Sponge.

We put up our Absorbent Cotton in neat and convenient packages, containing one pound, one-quarter pound, and two ounces.

A descriptive Circular will be forwarded on application. Samples containing two ounces will be sent, free of postage, on receipt of twenty cents.

PEPTONIC PILLS.

Pepsin, Pancreatin with Lacto-Phosphate of Lime and Lactic Acid.

(COPYRIGHT SECURED.)

This pill will give immediate relief in many forms of Dyspepsia and Indigestion, and will prove of permanent benefit in all cases of enfeebled digestion, produced from want of proper secretion of the Gastric Juice. By supplementing the action of the stomach, and rendering the food capable of assimilation, they enable the organ to recover its healthy tone, and thus permanent relief is afforded. One great advantage of the mode of preparation of these pills is the absence of sugar, which is present in all the ordinary Pepsin and Pancreatic compounds. In this form, the dose is much smaller, more pleasant to take, and is less apt to offend the already weak and irritable stomach. The results of their use have been so absolutely satisfactory, that we are confident further trial will secure for them the cordial approval of the Medical Profession and the favor of the general public.

Each pill contains one grain of pure PANCREATIN, which is equivalent to 10 grains of the ordinary or Saccharated usually prescribed and dispensed. Physicians will appreciate the great advantage of this mode of administration, the increased benefit to the dyspeptic being due to a full and effective dose of each, freed from unnecessary bulk, and really hurtful addition of sugar. A single pill will give immediate relief.

DIRECTIONS:—Take one pill immediately after eating or when suffering from Indigestion, Lump in the Throat or Flatulence. For children, reduce the pill to powder and give one-fourth or half, according to age.

THE ACTION OF ERGOT, PARTICULARLY AS IT RELATES TO MEDICAL JURISPRUDENCE.

BY JOHN MORRIS, M.D.,

Of Baltimore, Md.

(Read before the Baltimore Academy of Medicine.)

Forty years ago ergot was used solely in cases of labor; within the past ten years there is not a single malady or form of malady in which it has not been tried, and for the relief of which it has not been recommended. It would be an amusing study, were it not damaging to our art, to look over the medical periodicals of the day and observe the many suggestions they contain in regard to its use. "Rusticus" writes to a journal to obtain a remedy for some intractable trouble that has baffled his rural skill. "Medicus" and a host of other scribes reply at once, "Give ergot a trial; its action on the capillaries, through the vasomotor system of nerves, or its well known influence on unstriped muscular fibre, indicate its use. Try it at once, and the case will certainly improve." This is the kind of advice daily tendered to puzzled leeches, no matter what the character of the disease or the organs involved. In consultations, too, when it is discovered that the attending medical man has tried all the usual remedies, the consulting physician will, as a dernier resort, suggest the employment of ergot. The more obscure the case the more likely is this suggestion to be made. In looking over the journals on my own table, for the past year, I find recommendations of ergot for the following diverse maladies: Intermittent and remittent fever, trichinosis, coma, cerebral apoplexy, keloid and cystic tumors, cholera, diabetes, tonsillitis, etc. I find it also suggested as an antipyretic, and it is said, by its advocates, to be a preferable remedy to quinine or digitalis. Bartholow, our most recent authority in therapeutics, recommends it also in chronic diarrhœa and dysentery, hemorrhoids, relaxation of the sphincter ani, prolapsus of the rectum, enlarged heart, various forms of hemorrhage, vertigo, epistaxis, headache, tinnitus aurium, mania, migraine, epidemic cerebro-spinal meningitis, acute myelitis, inflammation of the conjunctiva, blepharitis, phlyctenular ophthalmia, incontinence of urine, spermatorrhœa, paralysis of the bladder, as well as various uterine troubles not necessary to name. The alienists, too, not to be behindhand, have added it to their scanty repertory, and it has become a favorite remedy in troubles of the brain and spinal cord.

In view of this condition of things, is it not time that a careful examination should be made of the merits of this many-sided agent, to the end that its true powers be understood, and a proper place given it in our therapeutics? As the case now stands, its employment is wholly empirical, and, as a consequence, unscientific. It is important, then, for the sake and in the interest of those who are about entering into professional life, that some well settled, well defined views should be laid down for its use, and these views, to have any weight, must be based on active bedside experience. Theory is all very well; investigations on healthy frogs and rabbits, and comparative experiments of every character, should have due weight, but clinical facts are of more importance and of greater practical value. I

shall, therefore, very briefly submit to your consideration the results of my own observation and practice.

As I said before, ergot was only used, for a great number of years, in certain conditions of labor, and in wise hands afforded certain and most useful results. After a time it came to be used in cases of abortion, to hasten the extrusion of the fœtus; next a theory in relation to its power to contract the capillaries was advanced and received with favor, and it was generally employed, and is still employed, by a large number of practitioners, to check hemorrhage, in cases of threatened abortion. How far it is useful in these conditions will be discussed hereafter. In a few years the extent of its powers became enlarged, and it was tried very generally in hæmoptysis, pulmonary and other forms of hemorrhage. This was twenty-five or thirty years ago. Since that time its powers have amplified in a most marvelous manner, as the statement heretofore given most markedly proves. It has reached a point now, I think, in which a reaction is imminent—a reaction which, in my judgment, must prove salutary.

Though the chief object of this paper is to discuss the merits of ergot as an oxytocic agent, and its relation in this respect to matters of medical jurisprudence, I shall briefly allude to its virtues as a remedy in the treatment of diseases independent of the uterus. I am sorry to state that in all cases of hemorrhage not of uterine origin, when tried independently of other means, it has utterly failed in my hands, and I should greatly regret to have to depend on it for success in the treatment of such cases; and further, were I a teacher of medicine, I should not urge upon my students its employment in the treatment of hemorrhages of a serious or alarming character, certainly not to the exclusion of the mineral acids, ice, tannin, acetate of lead, opium, etc. In a recent case that came under my observation, through the kindness of Dr. I. H. Hartman, of this city, a case of passive pulmonary hemorrhage, well suited to test its powers, it proved thoroughly valueless. The patient was a young lady, the daughter of Judge W., of the Eastern Shore of Maryland. Dr. Hartman administered teaspoonful doses of Squibb's extract of ergot for several days, and also employed it hypodermically in large doses, without the slightest apparent benefit. This was done, too, in conjunction with absolute rest.

Ergot has been highly recommended for enlarged prostate, with vesical atony of the bladder, and Langenbeck claims to have seen surpassing results from its use in this condition. I much doubt its efficacy. The late Prof. Nathan R. Smith suffered from this trouble, and in his case it failed to exercise the least beneficial effect. Its influence over the sphincter of the bladder is claimed, on account of the difficulty of micturition produced by large doses, and this effect is held to be due to its power over the spinal cord; but this result may be obtained from other remedies, given in toxic doses, that are not supposed to exercise any control over the spinal system. Ergot is also greatly lauded in hemorrhoids, but it possesses no advantage over carbolic acid, acetic acid, or any other agent that will induce atrophy of tissue. In those cases of hemorrhoids and keloid tumors where it has been used hypodermically with success, I am convinced that the menstruum containing the ergot would have been equally effective without it.

Two weeks ago, two well known medical men of this city prescribed ergot for an old patient of mine suffering from chronic kidney trouble, complicated with severe neuralgia of the left leg. I saw this gentleman to-day. He is much worse; his appetite is destroyed; his tongue and throat dry and painful, and his general strength greatly lessened. This condition may not be entirely due to the ergot, but I am convinced that he would have been better without it. In many of the diseases before mentioned I have not given it a fair trial, and am, therefore, not prepared to speak positively concerning its powers. The statement of Langenbeck, that its hæmostatic action can be obtained in all cases of capillary hemorrhage, and even in the small arteries, when the tissue entered is smooth muscular fibre, is, I think, a matter of conjecture; indeed, the whole modern theory that ergot possesses an elective affinity for the involuntary or unstriped muscular fibre, wherever this is found in the body, is, in my judgment, still a question in dispute. Experience and clinical observation prove, beyond doubt, that it has an absolute affinity for the uterus, and particularly that it exercises a peculiar influence over the longitudinal fibres of that organ. Over and above this, everything is mere theory and suggestion, and the true place of this great agent still remains to be fixed in our therapeutics. My own view is, that the influence of ergot is limited to the lower portion of the cord—that portion from which the uterus receives its nerve supply. Clinical experience, I hold, affords no positive evidence of its specific action on any other portion of the body. In saying this, I am not unmindful of the experiments

of Brown-Séquard, Meadows, Holmes, Schatz, Peton and others, all of which tend to prove that ergot contracts the minute arteries, as well as impedes, or even prevents, the passage of the blood into the heart itself. Though I have administered it in hundreds of cases, I never yet have been able to trace out any influence on the heart or general circulation. I am, therefore, constrained to believe, with Headland, that it is a stimulant, and that its action is specially directed to the muscular nerves of the gravid uterus, and to no other system of nerves in any marked degree. To its influence on the ganglionic nerves supplying the womb must be ascribed the good effects resulting from its administration in some cases of hemorrhage of that organ.

Its powers, too, as a toxic agent, have been greatly overstated. It is represented as an active poison in many of our text-books and in treatises written on the subject. It is said that cows fed on it cease to give milk, and as proof of this, an outbreak is evidenced of ergot poisoning in Russia, a few years ago; yet my friend, Dr. Drysdale, administered half ounce doses of Squibb's extract three times daily, for more than a year, without the slightest bad effects. The cases, therefore, of sloughing and sphacelation, reported as due to its long continued administration, must be viewed with distrust. Men are too apt to reason from a preconceived theory, and to claim results from the operation of this theory, when they (the results) may have been brought about by other agencies. It is possible, however, that when administered in toxic doses it may cause the destruction of tissue, by lessening the vitality of the system, and thus interfering with the process of nutrition.

Having thus briefly adverted to the qualities of ergot in a gene al way, we now come to the main object of our paper, the discussion of its powers as an oxytocic, and its relation to matters of medical jurisprudence. Ergot exercises no influence, in my judgment, on the unimpregnated uterus, nor does it act with sufficient power, in the early months of pregnancy, to produce abortion. There is, however, a lax condition of the neck of the uterus, attended by a special irritability of that organ, often to be found in women of a certain type, in the second and third months of pregnancy, which seems to favor the occurrence of abortion. This condition is readily discovered by the finger, and is no doubt familiar to all the gentlemen of the Academy engaged in obstetric practice. In women of this character ergot might prove an oxytocic, and if abortions ever occur from its administration, it must be in such cases. Then, again, there is a class of women who have acquired the habit or trick of aborting, women who are easily affected, not only by outward agencies but by the simplest therapeutic means; ergot given to such women might produce the expulsion of the fœtus; for, while it has not the power of initiating contractions in the uterus itself, certain symptoms are manifested from its use, such as pain in the back and thighs, which might extend to the womb, provided it be in an irritable and relaxed condition, and ready to be affected by any exciting influence. In labor, however, at full term, or in the last months of pregnancy, when the muscular fibres are fully developed and already contracting, there is no doubt of the power of ergot to stimulate the uterus to increased action. Through this power it acts most beneficially in the third stage of labor, by preventing the tendency to hemorrhage. Its beneficial effects in certain cases of fibroid tumors can be explained by the increased tonic action of the uterus which it excites and keeps up. The muscular fibres of the uterus are developed by these fibrous growths, in a manner exactly similar to that of the gravid state. The point, however, which I most particularly desire to make at this time is, that in a healthy woman ergot will not induce premature labor or produce abortion. The truth is there are no agents that act specifically on the uterus. Emmenagogue remedies are, as a rule, utterly useless, and should be discarded from the pharmacopœia. They are a relic of a rude barbarism in medicine. Among these ergot has occupied a very important place. It has been prescribed indiscriminately, in every case of supposed uterine disturbance, no matter what the cause or whence the origin. I hazard nothing in saying that, employed by itself—that is, independently of other means—it will utterly fail to restore uterine functions or build up the health. This is much to be regretted, as it is prescribed by young practitioners in a very loose manner, as a deobstruent, without much knowledge of or regard for its real powers. No medical man of intelligence would, I am sure, administer ergot for the purpose of inducing premature delivery, and yet it enters into the composition of all the nostrums sold by quacks and abortionists for this purpose. The public generally believe that it possesses oxytocic virtues, and this opinion is shared by judges of the courts and officers of the law. A belief in other oxytocics, such as tansy, rue, savin, iron, etc., is very common, particularly among midwives and ignorant persons. A case is cited in the *Journal of Medicine*, December,

1876, of a poor girl who was tried and sentenced to three years' imprisonment, on the evidence that she had taken some savin, and had aborted. Is not this lamentable ignorance in an age enlightened by so many works on therapeutics, and does it not show the necessity of some fixed views being established in regard to the effect of agents of this character?

Doctor Heillar, of Edinburg, mentions a case in which a medical man was accused of giving ergot in early pregnancy, for the purpose of producing abortion, premature labor having subsequently come on, causing the death of the woman. The defence was that sarsaparilla was given, and not ergot. Chemical analysis having failed to detect the difference between the drugs, the case fell to the ground. In a recent trial in this city, the prisoner, Hoover, was convicted of attempting to produce an abortion by the administration of a mixture containing ergot and cannabis indica, though several experts testified, among the rest, myself, that ergot had not the power to induce premature delivery in a healthy subject. The verdict was a very righteous one, for the wicked purpose of the prisoner was clearly proven. The only regret is that the physician who compounded the mixture was not also indicted and convicted. In this case, though the testimony of the medical men was not conflicting, there was an ambiguity and a want of positiveness evinced, much to be regretted. Hoover has been adjudged a new trial by the Supreme Court, and it is to be hoped that on that occasion the medical witnesses will be direct, positive and explicit in the evidence they may give to the court, so that it (the evidence) may have the full weight of authority.

There is no doubt, however, in my mind, that in cases of labor ergot often exercises an injurious effect on the child. I remember two cases in my own practice in which death was produced by the persistent and unremitting contraction produced by its use. It is the rule to administer it in the second stage of labor, when the pains become feeble and inefficient, and the woman seems to be losing strength; but in this condition the application of the forceps is by far the safest and speediest mode of delivery. The safety of the child is far better secured by this means. Natural labor pains are regular, intermittent, and rhythmical in character; under the influence of ergot they become violent, irregular, and almost unceasing. It should, therefore, be given very cautiously in primipara, as the severe pressure induced by its unremitting spasmodic action greatly endangers the life of the child. Quinine is, I think, a much safer and equally efficacious remedy.

Ergot is not a certain and reliable agent, even in hemorrhage of the uterus, or in cases of threatened abortion, though it is universally, and sometimes very wildly, prescribed in those troubles. My experience is, that it frequently increases the hemorrhage; that many times its administration is followed by no positive results, and that it is only at times that any perceptible good effect is observable. In hemorrhages that attend the menopause it is particularly valueless. In a recent case of uterine hemorrhage in an old woman, its use for more than a week failed to control the flow in the slightest degree; yet the use of cold water, injected for two days only, effectually arrested it. In two cases of persistent metrorrhagia which I now call to mind, occurring in women of middle age, ergot was given for several weeks, in vain. These cases yielded promptly to large doses of dilute sulphuric acid and vaginal injections of cold water. There can be no doubt, however, concerning its power in controlling post-partum hemorrhage, provided it be given at the right period, that is, in the concluding stage of labor. I have seen it fail when given some hours after delivery. The exact fibres of the uterus acted on specifically by ergot have not been determined with certainty. I am myself disposed to believe, with Meadows, that it is the longitudinal fibres that are affected by it, though some writers claim that the circular ones are alone acted on. I have never yet seen hour-glass contractions follow its use, and I am inclined to believe that, were the circular fibres the seat of its peculiar influence, this unpleasant complication of labor, due nearly always to faulty midwifery, would more frequently occur. I also think that uterine action commences in the fundus and not in the cervix of the uterus.

The deductions from the foregoing views may be summed up as follows:—

1. Ergot is prescribed very wildly, and frequently injudiciously.

2. Its powers as a general agent are not positively understood, and further clinical investigation and observation are necessary to give it its true place in therapeutics.

3. It exercises an unmistakable influence on the impregnated uterus during labor.

4. It has no influence over the non-gravid uterus, save when its muscular fibres are developed by foreign growths.

5. It has no power, in a healthy subject, to initiate labor or produce abortion.

6. Its administration in labor frequently en-

dangers the life of the child; and the forceps are to be preferred, in many cases, as a means of delivery.

7. That while it exercises an undoubted power in controlling uterine hemorrhage, the exact character of the cases in which this power is evidenced remains yet to be described.

VOMITING OF PREGNANCY—A FEW NOTES UPON ITS TREATMENT.

BY J. W. HICKMAN, M.D.,

Of Delta, Pa.

That so many agents of the pharmacopœia have been and are still being tried for the vomiting of pregnancy, is proof positive that professional opinion is still unsettled as to its proper management. Now one drug has been put forward as deserving of confidence; now another as certainly a specific; each, in time, to work out its own inefficiency. Thus has it been for all time, and it yet remains to find certain and satisfactory treatment for the various conditions upon which the nausea and vomiting of pregnancy are dependent.

If I succeed in making out a few notes of some of the plans of treatment, and attaching to each its real worth, the object of this paper shall have been accomplished. If the vomiting can be traced definitely to its immediate cause, as nervous exhaustion and degraded blood, for instance, as is frequently possible, then the treatment becomes comparatively simple; but in those cases where we are left in the dark as to its etiology, we do not often face a more difficult problem.

A few years ago the late Sir. J Y. Simpson introduced the oxalate of cerium as an agent to be relied upon in a majority of cases. Many instances of its utility were cited by him, and very clear directions given for its administration. He was in the habit of giving it in ten-grain doses, as frequently through the day as seemed necessary (no danger need be apprehended from large doses of this drug, as there is a case on record where four grains were given every two hours until six hundred grains were taken; this was followed by good results). In some cases the good effects were immediate, while in others some days elapsed ere any benefit was to be observed. This treatment has become nearly obsolete, and as Dr. Image has put it,* merely because it has usually been given in the trifling officinal dose of a grain or two, instead of following the directions given by Simpson.

That oxalate of cerium is more or less efficient in a vast majority of cases, when properly given (ten grains as frequent as necessary, care being taken to give the first dose half an hour before the patient's rising time), cannot be doubted. Dr. Image, in the same article, says he finds it very satisfactory in nausea resulting from uterine irritation generally. In these instances he combines it with bromide of potash. This combination, he says, is successful where the latter drug given alone has utterly failed. I have known of the subnitrate of bismuth having been occasionally prescribed with the oxalate of cerium, but so far as I have been able to ascertain, with but indifferent results. Perhaps the best way in which to give bismuth is in combination with carbolic acid, as in a formula suggested by Bartholow,* viz.:—

℞.	Bismuth subnitratis,	ʒ iij
	Acid carbol.,	gr. ij–iv
	Mucil. acaciæ,	ʒ j
	Aq. menth. pip.,	ʒ iij.

That author says excellent results are sometimes obtained from this formula, in tablespoonful doses three or four times a day.

A remedy of no mean value in the vomiting of pregnancy is arsenic, in the shape of Fowler's solution. It is not to be wondered at that a remedy so signally valuable in chronic gastric catarrh and the morning vomiting of drunkards should relieve the trouble in question. It is especially indicated when the vomiting is followed by painful retching, and where the ejected matter is streaked with blood, or where blood alone is cast up. It is here that arsenic gives results that are frequently most satisfactory. A drop of Fowler's solution should be given before meals; its action is sometimes more reliable when administered with a few drops of laudanum.

Where there is simply nausea without vomiting, and attended with vertigo, a friend of the writer has found the tincture of nux vomica, in half drop or drop doses every hour or two, in a little water, extremely servicable. Nux vomica is specially indicated where the above condition exists in connection with a torpid condition of the bowels.

In the case of women who are habitually afflicted with delicacy of the stomach, and in whom this condition is exaggerated during pregnancy, the old demulcent tonic, calumba, will often be found more or less serviceable, and is

* *Practitioner*, for June, 1878, page 401.

* "Materia Medica and Therapeutics," 1st edition, page 113.

well deserving of trial. As in case of most remedies for the gastric irritability of pregnancy, it must be admitted, however, that the precise circumstances demanding it are not definitely known, and can only be approximated. An excellent preparation where calumba seems indicated, is the following:—

℞. Calumba,
Gentian root, āā ℥ ss
Ginger,
Rhubarb, āā ℥ j.

Work up together, and make a pint or pint and a half of infusion.

This common infusion will be found more serviceable than the elegant pharmaceutical preparations of the shops.

I have occasionally seen an *old* opium pill check the vomiting at once, after several of the usual remedies had been vainly tried. Another method, at times very effective, though less pleasant, is the application of a blister to the epigastrium, on which may be put ¼ to ½ gr. acetate of morphia.

Where the vomiting has continued until severe prostration is induced, it is said that champagne sometimes exercises an admirable influence. I have seen one such case, in which its effect was almost magical.

When the ejected matter is alkaline, nitro-muriatic acid will, as a general rule, be found a fairly reliable palliative measure. On the other hand, where marked acidity exists, of course the ordinary correctives will be tried.

Dr. J. H. Scarff has reported a few cases in which the vomiting of pregnancy was cured by the rectal injection of chloral. Twenty grains were injected, night and morning. Only a few (3 to 5) injections, he says, were required. Personally, I know nothing of this plan of treatment, but it seems so reasonable that I shall try it as soon as a suitable case offers. Strange as it may theoretically seem, a drop of the wine of ipecac. will often be found exceedingly effective. This fact would evidence in favor of views offered with reference to the action of drugs by William Sharp. M.D., F.R.S., in various numbers of the *Practitioner* for this year.

Among the more reliable measures, it now remains to speak of the so-called ingluvin—simply the inner membrane of the chicken's gizzard. It may be prepared by any one thus: The membrane should be lightly scraped, never washed, then dried at a moderate temperature, in the sun, for instance, when, in an hour or two, it may be powdered as fine as flour. It should be given before meals, in dose ranging from five to twenty or thirty grains, as seems to be required. The first time the writer ever saw this agent administered was in a case of acute gastritis; it was retained when everything else that was tried had been ejected. It has an exceptional power in controlling the vomiting of pregnancy, and in my opinion, stands first among the agents reviewed. That all medication sometimes fails in this disorder cannot be doubted. In such cases, where dangerous prostration follows, that one final remedy, premature labor, is vindicable, upon every basis of humanity and correct therapeutics.

ON THE TOLERATION OF THE PERITONEUM TO RESIST INJURIES.

BY JOSEPH H. WARREN, M.D.,
Of Boston, Mass.

This has been a theme of great interest, from very earliest times to the present, the older writers often feeling very timid in their treatment of any injury or wound, small or great, that should occur to the peritoneum, and giving almost always unfavorable prognostications, even in the slightest and most trivial injury to this membrane. In many cases, however, the more ancient mode of combating inflammation of all kinds, and particularly of this membrane, did prove fatal, no matter how assiduously the antiphlogistic treatment, internal and external, was applied.

We are taught, however, by more modern surgery, that by the application of water and the internal use of opium and veratrum viride, under proper hygienic rules, serious injuries of this membrane are not only combated, but brought to a more favorable issue.

This has been illustrated in our civil contest, and other late wars. The great tolerance of the membrane has been still further illustrated by that honored son of Kentucky, Dr. McDowell, and by Drs. Atlee, of Philadelphia, Peaslee, of New Hampshire, Spencer Wells, of England, and other ovariotomists, as well as by Dr. Heaton, in his numerous injections for the radical cure of hernia. I have heard from Dr. Heaton's own lips that—and so we are led to infer from his published work—he frequently punctured the peritoneum, both in the umbilical and inguinal region.

To illustrate this tolerance more fully, I would here relate a few instances of the many injuries to this membrane that I have known:—

In my earliest years Mr.—— called upon me. He had had the misfortune to receive a wound from a large rat-tail file, which struck him about

three inches above the symphysis pubis. It punctured the superficial integuments and the bladder near its fundus.

Here, it is true, we had a favorable portion of the peritoneum wounded, as regards subsequent inflammation.

Although the man had acute cystitis from the injury, still, after the wound had discharged pus and urine for some time, he made a good recovery, without any peritonitis.

Another patient, in the year 1856, while in the delirium of fever, jumped from an attic window into the door yard, upon a stump covered with dry roots. As he fell he was impaled through the perineum to the rectum, and the walls of the abdomen were pierced in several places, just above the base of the bladder and the crest of the ileum, on the right side of the linea alba, by those small, dry rootlets, which were jagged and rough, and varied in size from a goose quill to half an inch in diameter.

Yet from all this serious injury, suffering as he was at the same time with typhoid fever, he made a good and successful recovery, suffering, however, for some months, from paralysis of the neck of the bladder.

Still further to illustrate, I will mention Mr. H., a case occurring in my practice on Christmas eve, 1857. He was suffering from a wounded abdomen, which had been torn from the pubic symphysis to nearly the ensiform cartilage, by a dull jack-knife, used for the cutting of tobacco. From this wound most of the small intestines had escaped to the floor of a room covered with coal dust and the debris of a midnight carousal. After etherizing my disemboweled patient, I passed the intestines through my hands, bathing off, with warm olive oil, the filth adhering to them, and closed the frightful wound by deep sutures and adhesive plaster. Over the abdomen I laid a cloth covering of cotton wool, and upon this placed a bladder filled with ice, which was frequently renewed. I placed the man in bed, administered thirty drops of laudanum and an injection to the rectum, and gave, I must confess, a most unfavorable prognosis. To my surprise, I found on my first dressing, forty-eight hours afterward, that the wound had healed by the first intention, with no peritonitis or other intestinal or abdominal inflammation.

I may conclude these illustrations by mentioning a very remarkable case of rupture of the uterus, while in labor, and the escape of the child through the rent into the abdominal cavity. This resulted from a contracted pelvis. The woman had gone her full term, and the child, a large one, was extracted through the ruptured organ, a wound being made sufficiently large to admit the hand and arm of the gentleman with me, Dr. Benjamin Cushing, of Boston, so that I could feel his fingers and hand at the ensiform cartilage. This case was detailed at the time in the Boston *Medical and Surgical Journal.* Suffice it to say that she made a rapid recovery, without peritonitis, and in about the usual time as if she never had suffered from a ruptured uterus. You may judge of my surprise, when on the following morning, entering the patient's room with my autopsy case under my arm, I found, not the fine subject for study which I had anticipated (but was happily disappointed in), but the patient sitting up in bed eating a bowl of gruel, and in the most cordial manner saluting me with the compliments of the opening day.

I therefore feel more confident at the present time, after the experience I have had, that if in any way, by accident, as in injecting, for radical cure, the hernial rings, whether in umbilical, inguinal or femoral, I pierce this membrane, unfavorable results will not occur necessarily. As yet I have never had a fatal result in any of the cases where I was led to suppose that I might have punctured the membrane. I would not, nor would I advise any one to puncture the peritoneum, if it can possibly be avoided, however.

I am a firm believer, as you may infer from reading these cases, in the application of cold water or ice, either in rubber bags or in bladders. I have never seen a case of peritonitis, arising from any injury, that was not followed by favorable results if these means were used to allay the inflammation, and I have yet to see a case requiring the application of poultices or hot fomentations to bring about such favorable results.

These applications of poultices for abdominal inflammations involving the bowels, peritoneum, and the uterus, have been, I believe, the bane of surgical treatment by ancient physicians, and by some physicians of the present day. They are unnecessary, unless there has been an open wound and suppuration, and even in these cases a large majority, I think, would be better cured by the applications of cold, either dry or moist.

I can conceive that there may be some exceptions to the universal use of these cold applications, and in these cases hot stupes of terebinth and opium combined with chloroform might be useful, as, for example, in the puerperal diseases of women, involving the uterus and its appendages, and attended with great tympanitis, and also in the tympanitic condition of enteric and gastric fever. Still I think it will be found that

in very many of these cases the water or ice bags will be of the greatest benefit in a successful treatment of all these inflammatory actions. At least I have so found it in my practice, and I moreover prefer the ice in a bladder to that in a rubber bag, because the tissues of the body take more kindly to an animal tissue than to a smooth, clammy, rubber surface.

Every surgeon who has had much to do with operations and wounds in the abdominal muscles and integuments, particularly in the inguinal and pelvic regions, must be struck with the vast amount of sero-plastic lymph poured out from any injury or wound of these parts. Even in the application of a blister to this portion of the body it will be noticed that we have a far greater amount of serum poured out than we do when one is placed upon almost any other part of the body.

In the injections into the hernial rings, for the cure of rupture, we take advantage of this, and in some cases we may have a full occlusion of the hernial rings, even after we have partially divided some of the muscles and ligaments for the release of the strangulated intestine, and we obtain a far more favorable result than perhaps might be reasonably expected from so severe an operation. This takes place from the adventitious tissue formed by the serum lymph, and from the cicatrical contraction of the wounded muscles; hence any irritation of these fibres, fascia lata, etc., by means of astringent fluids injected upon them, will be found to produce a free effusion of this lymph, which soon becomes organized, and unites the oblique internal and external transversalis and transversalis fascia, and so forth, fully together, and the greater the amount of serous effusion, the more sure are we of obtaining this desirable result in the radical cure of hernia.

I have become so familiar with this condition and abundant effusion, that I can usually judge whether I shall get an occlusion and union of the parts of the hernial rings in my operation for the cure of rupture, in the course of forty-eight hours. After I have operated, should the effusion be slight, I do not anticipate a very satisfactory result, but on the contrary, if it be abundant, I look, and not generally in vain, for a most favorable and permanent cure of the hernia.

SERVICE OF DR. WILLIAM PEPPER.

Reported for the Medical and Surgical Reporter.

Typhus Fever.

Gentlemen—There are two cases in the medical wards which present unusual and important conditions. They are both suffering from continued fever, but there are reasons for regarding the form of this fever as different from typhoid. This latter affection is so continuously prevalent in this community, as it is in most large cities, that it has gradually come to be felt that if a patient presents symptoms of a continued fever he is pretty certainly going to have typhoid. It is only from time to time that we have cases of relapsing or of typhus fever occurring in Philadelphia. Thus, although every year there are some few cases of death from typhus fever reported to the Board of Health, I think it is open to doubt whether, in the majority of such instances, typhoid has not been carelessly or ignorantly styled typhus fever. The following figures will show the reported mortality from the latter disease for eleven years:—

REPORTED DEATHS FROM TYPHUS.

1867	138	1873	31
1868	108	1874	26
1869	49	1875	21
1870	69	1876	27
1871	37	1877	15
1872	35		

They show that typhus fever has not prevailed in what could in any sense be called an epidemic form since 1870, and it has certainly been six or seven years since any cases of this disease have been admitted into the Philadelphia Hospital.

I will now read you the notes of the patient to whom I wish to ask your special attention.

J. W., age thirty years, living in a decent boarding house in the northwestern part of the city, and employed on the line of the Pennsylvania railroad, was attacked, about November 7th or 8th, with fever, weakness and headache; there were also at first nausea, with vomiting, and some spontaneous diarrhœa, with thin yellowish stools. He also had slight epistaxis. After the first two or three days his bowels became costive, and continued so throughout the case. Epistaxis did not recur and there were no bronchial symptoms.

On admission, the temperature was 104°, the pulse very rapid, small and weak; the mind was very dull, with occasional mild delirium; the conjunctiva was minutely injected, the pupils about normal; the tongue was very dry, but not heavily coated. A copious eruption was present when he was admitted. It existed on the trunk, front and back, and the thighs and calves, and on the arms, but was most marked on the anterior aspect of the trunk. Here the surface appeared mottled, being sprinkled, quite closely, with small, roundish, dark red spots, not elevated above the surface, and on pressure not disappearing entirely, but leaving a persistent centre,

while the peripheral zone of congestion went and came on pressure, when made or removed. During the two or three days succeeding his admission the size of the centre which thus remained persistent distinctly increased, until, in some instances, the whole spot was uninfluenced by pressure. No successive crops of eruption appeared. He has been treated with moderate doses of quinine (gr. xij, daily); fluid diet; small amounts of stimulus. The pulse improved soon, so as to indicate a favorable prognosis. The eruption began to fade on the 9th day. During the early morning of day before yesterday, Nov. 18 (10th or 11th day), an abrupt fall of temperature from 104° to 100° occurred, with free and general sweating. That evening the temperature rose to 102.5° but fell during the night, and has since continued normal, or even below normal. There was a corresponding fall in the pulse rate, and improvement in all other symptoms, so that at present (Nov. 20) convalescence is begun, and will probably progress rapidly.*

It will at once be noted that the symptoms of this case have been somewhat anomalous. In the first place, the eruption has clearly not been that of typhoid fever. In this disease, as you are all aware, the eruption appears about the end of the first week; occurs in successive crops, and is usually most marked over the upper part of the abdomen. It varies greatly in its amount, and bears no relation to the severity of the attack. The spots composing the eruption are lenticular or oval in shape, from one-half a line to two lines in diameter, and of a pale rose-red color throughout. They are slightly elevated above the surface, and disappear entirely on pressure of the finger, returning when the pressure is removed. Each crop of spots lasts a few days, and is, as a rule, followed by successive crops. In the present case it will be seen that the eruption differs markedly from the above. We do not know on what day the eruption appeared, as the man was not admitted until the seventh day of the disease. The eruption was then copious, extending over most of the surface. The spots were of irregular size and form; were not elevated above the surface. Pressure caused the outer ring of the spot to disappear at first, but the centre remained persistent, and later the entire spot, in many instances, was unaltered by pressure. There was no subsequent crop, and the first crop did not fade until the close of the fever. Associated with them was distinct mottling of the skin. This character belongs to the eruption of typhus fever of a moderately severe grade, for in this affection the eruption does bear a close relation both to the number of the petechiæ, the character of the spots, and the severity of the attack.

It appears to me necessary to consider this case, therefore, as one of typhus fever; and yet, while this view accords with the character of the eruption, in the course of the case there are some points which indicate that it must be a modified form of that disease. When relapsing fever prevailed here, and again, when cerebro-spinal meningitis prevailed, typhus was also prevalent, and it was noticeable that many cases of the latter were distinctly modified by the co-existing epidemic disease. Now, in this community, as already stated, typhoid fever constantly prevails, and I have very frequently observed cases of typhus fever which were apparently modified by association with that affection. Ordinarily, in typical cases, the two diseases present marked differences in almost every particular. We have seen how the eruption differs. There is also a difference in the conditions under which they arise. Typhoid occurs in all classes and all ages. Typhus occurs chiefly under conditions of filth, overcrowding and starvation, except when it occurs epidemically. The onset of typhoid is more gradual, the course is more slow and prolonged, and the approach of convalescence is also more gradual. In typhus the onset is much more abrupt, the duration shorter—ten to fifteen days, as a rule—and the end of the disease is often marked by a distinct crisis. I have had unpleasant proof, both of this more abrupt beginning and of the higher degree of contagiousness of typhus fever.

Late one night I made an autopsy on a patient who had died of malignant typhus. I well remember the instant, almost intoxicating, effect of the absorption, by inhalation, of the virus; before daybreak I had a chill, followed by a high fever, and a tedious case of typhus fever. So in typhoid fever there are certain special symptoms which are usually absent in typhus; the most marked of these are, epistaxis, bronchial irritation, and a distention of the abdomen, with diarrhœa; but you have heard that during the first two or three days, in the present case, our patient had epistaxis, nausea, vomiting, pain in the abdomen, with looseness of the bowels. It is true that these symptoms are not positive proof that any typhoid fever element is present in his case. They are more evidence of wide-spread congestion of the mucous membrane, which might occur here—a catarrhal attack coincident with the onset of his fever; still, such symptoms are rare in any continued fever, excepting typhoid, so that their occurrence at the beginning of a case of continued fever justifies the suspicion that it will prove of typhoid character. On former occasions when typhus has occurred in this city I have met with very many cases where these symptoms of typhoid were associated, while, on the other hand, there were cases of undoubted typhoid fever which did not present all of the characteristic symptoms, being modified by a coexisting typhus element. My suspicions in the present case are confirmed by the fact that two additional cases of fever of mixed type are now in the wards of this hospital.

It may then be regarded as an established fact, that typhus fever may have typhoid fever associated with it, so that the case would, with strict accuracy, be called one of typho-typhus fever, and it seems altogether probable, to me, that the present case is of that character. You see that the disease is terminated by a brief crisis on the 14th day, and probably the patient will have a rapid and uninterrupted convalescence. It is a curious fact that where you have a case of this mixed type, the mortality is not usually high. In cases where I have had the opportunity of

* The convalescence was unusually rapid and uninterrupted.

examining the lesions in the intestines, they have not been as far advanced as would have been the case had the attack been one of uncomplicated typhoid fever. I have felt it important to bring this case before you, not only on account of the great interest attaching to this irregular form of fever, but because it is not unlikely, if my view be correct, a considerable number of similar cases may be observed here before the winter is over.

HOSPITAL OF THE UNIVERSITY OF PENNSYLVANIA.

CLINIC OF LOUIS A. DUHRING, M D.,

Professor of Skin Diseases.

Circumscribed Phlegmonous Dermatitis, Due to Iodide of Potassium.

The patient, a woman sixty years of age, had been referred to Dr. Duhring, by Dr. T. C. Rich, on September 29th, 1879. She had been under treatment for rheumatism during some weeks previously, for which five-grain doses of iodide of potassium, with wine of colchicum, had been administered. About a fortnight before she had come under observation a singular eruption had made its appearance upon the forehead, in the form of a slightly inflammatory annular patch, half an inch in diameter, consisting of a number of pin-head-sized vesiculo-pustular lesions, and resembling an irritated example of ringworm. This had extended rapidly, so that in the course of four or five days it had attained a diameter of an inch and a quarter, and was accompanied by considerable thickening and infiltration, the pustular lesions having become more deeply seated, larger and more prominent. About this time, a similar but more deeply seated inflammatory patch appeared on the left cheek, studded with numerous pin-head-sized pustular foci of apparent suppuration. A third and fourth lesion manifested themselves on either side of the nose.

When first seen by Dr. Duhring the disease was at its height. The original lesion had reached a diameter of nearly two inches, and was a circumscribed, at points sharply defined, irregularly rounded, elevated, firm, thickened, inflammatory, reddish, violaceous patch. Its centre was a crusted, irregular depression, of a lighter color, and covered with a brownish crust, where the process was evidently subsiding. Over the patch, especially about the periphery, were numerous deep seated, yellowish, large pin-head sized, apparently sebaceous, pustular lesions, which had their seat manifestly in the middle and lower strata of the skin, evincing no disposition to rupture. These lesions were conspicuous, and presented a mammillated acne-form appearance on the cheek, where the patch was nodular, of a cherry red or violaceous color, with a slight inflammatory areola, while on the forehead they had, in some places, coalesced, giving the patch here situated a carbuncular look. The lesion on the ala nasi was the size of a large pea, sharply circumscribed, markedly raised, mammillated, and covered with a yellowish, tenacious deposit or coating, giving it a button-like or fungoid form. The fourth lesion was insignificant. When pricked or cut into, all the yellowish pustular points bled, but did not exude their contents, thus differing from ordinary pustules. The patient stated that the process had begun with itching, but that lately this had disappeared and had been replaced by a throbbing pain.

The patient was admitted to the hospital, and the iodide of potassium and colchicum mixture suspended. No local treatment was ordered. Two days later the disease presented an aggravated appearance, but there was otherwise no change. The following day a diminution in the color was noted, and the next day a disposition to dessicate and a decrease in size. From this date the amelioration was rapid, and the patient was discharged, quite well of the skin disease, at the end of a fortnight.

In commenting upon the case, Dr. Duhring said that when the patient first came under observation there was no history of the administration of iodide of potassium, and that the diagnosis had rested, in his mind, between two diseases, viz.: dermatitis, from the internal use of bromide of potassium, and an undescribed disease presenting very similar clinical features, of which he had recently seen a well-marked example in the ward for skin diseases of the Philadelphia Hospital, a full report of which was in preparation. Iodide of potassium had not occurred to him as a cause, having never encountered or heard of a similar eruption following the use of this drug. Some years ago (in 1869), when in London, Dr. Duhring had been taken by the late Dr. Tilbury Fox to see the case of an epileptic boy, under the care of Dr. Cholmeley, who was found to be suffering from a very extensive inflammatory eruption, in the form of palm-sized, raised, infiltrated, painful patches, involving, chiefly, the sebaceous glands. This eruption was determined to be due to the bromide of potassium, which the boy had been taking. This case was subsequently reported. A similar one may be found in the Sydenham Society's plates of skin diseases. Both of these eruptions were due to the bromide of potassium; the peculiarity of the present case lies in the fact that the manifestation is due to the iodide, and not the bromide of potassium.

Ignipuncture in the Treatment of Fungous Arthritis.

The following are the conclusions of M. Chalot on this subject:—

The great advantage of the thermo-cautery is, that it enables the practitioner to graduate the temperature, and that it is easily applied. The thermo-cautery acts in the depth of the diseased tissues to which it has been applied.

The author distinguishes between intracapsular and intraosseous ignipuncture, according to whether the cauterization penetrates only into the fibro-serous capsule of an articulation or into the osseous extremities of the joint.

If a limb with fungous arthritis be maintained in a state of methodic immobilization before suppuration and ulceration have set in, and thermo-cautery is applied at the same time, good results may be confidently expected, as it modifies the nutrition of the diseased tissues and produces sclerosis of the fungosities.

On the Treatment of Tinea Tonsurans.

In a clinical lecture reported in the *Lancet*, November, 1879, Dr. Robert Liveing says—

Nothing is easier to cure than tinea tonsurans of the trunk, or more difficult to deal with than the same disease when it is well established on the scalp. It is important that you should understand how the remedies in common use act. They may be conveniently divided into two classes—(1) Those which act by setting up sufficient inflammation in the skin to lead to the destruction of the disease; (2) Those of a milder kind, which act simply as antagonistic to the development of the Trichophyton tonsurans. To the former class belong such remedies as acetum cantharidis and strong acetic acid; to the latter belong sulphur ointment, the white precipitate ointment, and sulphurous acid lotion. Many remedies combine, as it were, these two properties; as, for example, chrysophanic acid ointment, iodine liniment, and strong carbolized glycerine. How are you to choose between all these and many other remedies? You must be guided by circumstances, and take into consideration both the age of your patient, and also the extent of the mischief. *Strong remedies are always contraindicated in very young children;* a little tincture of iodine painted on once a day, for a few days, followed by the use of the white precipitate ointment, is all that is necessary. In older children stronger treatment must be used, but even then you must be guided in your choice by the extent of the mischief. It is very unwise to make a large sore place on the scalp, as it will very likely give you and your patient more trouble than the ringworm itself. If, however, the disease is in an early stage, and consists of one or two small circumscribed spots, your best plan is to cut the hair short all round the spots, and apply with a brush Coster's paste, acetum cantharidis, or iodine liniment. At this stage a few applications will sometimes arrest the mischief. A single painting with pure carbolic acid is thoroughly effective, but it is a strong remedy, and gives some pain. Always bear in mind that it is very unwise to trust strong remedies to unskilled hands. When the disease extends over a large surface, you must be content with using milder measures—tincture of iodine of double strength, painted on every day, is a good and safe mode of treatment. This may be followed up by the use of the nitrate of mercury ointment, diluted according to circumstances, or an ointment containing the red and white precipitate of mercury and sulphur, or the oleate of mercury (10 per cent). For many years I have used, in certain cases, goa powder or chrysophanic acid ointment (thirty grains to the ounce is usually strong enough), and I have found it a very effective remedy, but there are great drawbacks to its general use. First, it stains everything with which it comes in contact, and in the second place, we are uncertain as to the amount of inflammation it may set up; some children bear it well, while in others it produces so much irritation, swelling, and discoloration of the skin, as to alarm those who use it. It must, therefore, be used with caution, and patients should be warned of its properties; nevertheless, I repeat, it is a very effective remedy.

Your success in the treatment of ringworm will depend on your choosing your remedies with judgment, being guided in your choice by the circumstances of the case, and always bearing in mind that you have to steer, as it were, between setting up too much inflammation on the one hand, and not using sufficient strong means on the other. Whatever treatment, however, you adopt, you will meet with a certain number of cases that defy your best efforts, and that get well only, perhaps, after years of tedious care. As a rule, shaving the head is quite unnecessary, but the hair should be kept quite short. Skull-caps are best avoided, as liable to propagate the disease. With regard to epilation, which is so largely used in France as a mode of treatment, I do not find that it is often necessary; it is, however, occasionally useful. Take, for example, the case of a boy anxious to return to school, who has a patch of chronic tinea tonsurans. In this case the extraction of the diseased hairs will shorten the treatment required, and enable him to return to school cured somewhat sooner than would otherwise be possible. Lastly, most observers agree that ringworm is often associated with a generally unhealthy condition of the skin, which is badly nourished. Under these circumstances, tonics, such as iron and arsenic, are often useful. This is quite in accordance with the fact that many strictly local affections are influenced by general treatment.

The Distinctions between Croup and Diphtheria.

That croup and diphtheria are distinct diseases is maintained by Dr. W. H. Day, in the *Medical Press and Circular*, and he points out the following distinctions:—

We constantly meet with genuine croup, of an acute and local inflammatory character, leading to the well known false membrane in the trachea and larynx, as described by the old-fashioned authorities. It seems impossible that we can mistake this true croup (which we have been in the habit of meeting with all our lives) for the peculiar membranous inflammation of the trachea sometimes seen in cases of diphtheria. It is well to glance at some remarkable points of difference in the two affections.

1. True croup is prone to attack the healthiest children, and in districts where diphtheria does not prevail.

2. True croup is apt to come on very suddenly, and in cases of recovery the general health is rapidly reëstablished, as compared with diphtheria.

3. In diphtheritic croup the disease is of a well marked character, and is always accom-

panied by great depression and nervous symptoms.

4. Croup is a local disease; diphtheria is a constitutional affection, in which the kidneys and intestines may be involved. Croup is neither infectious nor contagious; diphtheria is both.

5. The cases that recover from diphtheritic croup are few, and the convalescence is not only very slow and tedious, but the throat affection is usually preceded by a characteristic membrane on the palate, and the prostration is always great. Partial loss of voice, fetid breath, swollen neck and glands, diminution of muscular power, paralysis of the muscles of deglutition, and albuminuria, are common in diphtheria; but they are not witnessed in inflammatory croup.

6. Between croup and diphtheria there is also another very important diagnostic difference; diphtheria generally begins in the pharynx, croup in the larynx. The false membrane found in the larynx in cases of genuine croup is quite different from the leathery or yellowish gray exudation found on the tonsils, in the larynx and bronchial tubes, in cases of diphtheria. The pathological differences between croup and diphtheria are open to further contrast. In the early stage of croup there is an increase in the vascularity of the affected membrane, as in severe catarrh, with a trifling amount of inflammatory exudation. This is succeeded by fibrillation of the exuded lymph, which, with the new-formed cellular elements, becomes transformed into the characteristic *false membrane.* Its consistence varies, being in some cases tough, in others soft and amorphous, and easily removed from the mucous membrane beneath. In the larynx and upper part of the trachea, where the inflammation is most acute, the exudation is croupal or membranous, and is very characteristic of true croup, but in the lowest part of the trachea and diverging bronchi there may be nothing more than a scanty superficial layer of mucus.

"It is difficult in many cases to draw any line of demarcation between the histological changes occurring in diphtheria and those of croup. In diphtheria, however, the submucous tissue usually becomes more extensively involved, so that the false membrane is much less readily removed. The circulation also often becomes so much interfered with that portions of the tissue lose their vitality, and large ash-colored sloughs are formed, which, after removal, leave a considerable loss of substance."

7. If croup were identical with diphtheria, it seems to me that the operation of tracheotomy would rarely succeed; whereas it is often successful when false membrane has blocked up the tracheal tube, and has been removed from time to time after the operation.

Effects of Tea on the System.

Dr. W. J. Morton, of New York, describes a nervous disorder resulting from excessive tea drinking (*Journal of Mental and Nervous Disease*, Oct.), and adds these general conclusions on the subject:—

1. With tea, as with any potent drug, there is a proper and improper dose.

2. In moderation, tea is a mental and bodily stimulant of a most agreeable nature, followed by no harmful reaction. It produces contentment of mind, allays hunger and bodily weariness, and increases the incentive and the capacity for work.

3. Taken immoderately, it leads to a very serious group of symptoms, such as headache, vertigo, heat and flushings of body, ringing in the ears, mental dullness and confusion, tremulousness, "nervousness," sleeplessness, apprehension of evil, exhaustion of mind and body, with disinclination to mental and physical exertion, increased and irregular action of the heart, increased respiration.

Each of the above symptoms is produced by tea taken in immoderate quantities, irrespective of dyspepsia, or hypochondria, or hyperæmia. The prolonged use of tea produces, additionally, symptoms of these three latter diseases. In short, in immoderate doses, tea has a most injurious effect upon the nervous system.

4. Immoderate tea drinking, continued for a considerable time, with great certainty produces dyspepsia.

5. The immediate mental symptoms produced by tea are not to be attributed to dyspepsia.

In the above experiment upon myself, the whole group of symptoms was produced, with no sign of digestive trouble superadded.

6. Tea retards the "waste," or retrograde metamorphosis of tissue, and thereby diminishes the demand for food.

It also diminishes the amount of urine secreted.

7. Many of the symptoms of immoderate tea drinking are such as may occur without suspicion of tea being their cause; and we find many people taking tea to relieve the very symptoms which its abuse is producing.

How to Educate the Color Sense in Children.

Dr. Swan M. Burnett, of Washington, in a reprint, gives the following instructions on this point:—

Since the main object is to enable the child to discriminate between the various colors, the method of comparing one color with another must be the one employed. But the child should at the same time be taught the names of the colors and shades, for in his descriptions of colors it is important that he be able to convey to others the impression which he has himself received, in language not to be misunderstood.

To fulfill these indications in the simplest and most satisfactory manner there are required—

1. A set of "sample" colors, with which comparisons are to be made.

2. A lot of colors from which the pupil is to select colors to be compared with the "sample."

I arrange the "sample" colors in the following way:—

Take a half-sheet of white perforated card board (42x26 cm.), with the largest size perforations, and work into it, with Berlin wool, bars 18 cm. in length and 35 mm. in width, of each of the following colors, red, green and blue, with a distance of 1.5 cm. between them. These should be as pure as possible, and represent the three primary colors.

Then, beginning 3 cm. below, work in, at the same distance apart, each of the following colors, of medium shade, and as pure as can be got, purple, orange, yellow, pink, brown and gray. A single skein of Berlin wool is generally enough to work a bar of the required length and width, which is sufficiently large to be seen distinctly across any ordinary school room by a normal eye. This card is to be placed on a white background, on the wall, in sight of all the pupils.

The first step in the plan of instruction would be for the teacher to point out the various colors to the whole class, and give the names by which they are known, explaining that red, green and blue are the primary colors. Afterward each pupil is required to name all the colors when pointed out, in the hearing of the whole class. After the pupils shall have been able to name correctly any color pointed out on the card, the teacher will explain to them what a shade is, that it may be lighter or darker than the sample, etc., and taking a package of Berlin wools containing all the shades of the nine colors, will proceed to pick out and exhibit to them all the shades of one of the colors—red, for example. Each of the pupils will then be called upon to pick out the shades in the same way, after they have been thoroughly mixed up with the other colors in the pile, arranging them in regular order, from darkest to lightest.

The same process must be gone through with the other colors on the card.

From this point the instructions can be carried forward as far as the time and desires of the teacher will allow.

Ovarian Pressure in Hystero-epilepsy.

It has been demonstrated, by Prof. Charcot, that pressure on the ovary will not only arrest a convulsive attack of this disease, but prevent its appearance. Miss Alice M. Hart says, in the London *Medical Record*, on this subject—

To be able to keep up the pressure for a considerable length of time, M. Poirier has invented an ingenious modification of an abdominal tourniquet. By its means direct and limited pressure on the hyperæsthetic ovary or ovaries, can be kept up constantly for an indefinite period. The instrument is easily adjusted, and the patients can manage it themselves, increasing or diminishing the pressure, as they know by their own sensations they are more or less menaced. It is absolutely painless, and may be worn consecutively for forty-eight hours, without any bad consequences whatever. As long as the pressure is exerted, no convulsive attack occurs, and any attack once commenced may be instantly cut short by the *tourniquet* being applied. The hysterogenic spots do not exist while pressure is kept up, but return directly it is relaxed. We have frequently seen in the wards of M. Charcot, a patient lying quietly and happily in bed, encircled by an ovarian compressor, who, were it not for the pressure it exerts on the ovary, would be the prey of a series of violent hystero-epileptic attacks. This fact may be forcibly demonstrated by removing the instrument, when instantly the convulsive attack commences; but it is as certainly and speedily arrested by the pressure being re-applied. Not all patients are equally sensitive to ovarian pressure, and in some rare cases it does not succeed at all. It will be remembered that pressure on the ovary in a patient not in a convulsive condition is capable of producing the aura hysterica, and even a convulsive attack. It has also been found that other means provocative of an attack are, when an attack is fully established, capable of giving relief. These are more particularly the inhalation of ether and chloroform, and pressure on the hysterogenic spots. Ice on the region of the ovary will, if applied when the prodromata are first perceived, diminish the intensity of the attack, and perhaps prevent the convulsions altogether. The use of the continuous current has been found to be very valuable as a palliative. The continuous application of a current of from 5 to 10 elements of Trouvé's pile will not arrest the attack, but will diminish its intensity, and the series will be fewer in number; a current of from 10 to 15 elements will cut short the convulsions, and the patient falls into the delirious condition of the fourth period; in some cases, however, the most violent attack can be completely arrested by passing a current of from 40 to 80 elements through the head, and suddenly reversing the current. The patient awakes as if astonished, puts her hand to her head, and becomes perfectly conscious. M. Bourneville has made, at the Salpêtrière, a great number of observations on the influence of nitrite of amyl, and he has conclusively demonstrated that its administration will immediately arrest the convulsive attacks, and will, moreover, diminish their number.

Reviews and Book Notices.

NOTES ON CURRENT MEDICAL LITERATURE.

——An Atlas of Human Anatomy, to contain 180 large plates, is announced by A. E. Wilde & Co., Cincinnati.

——In a reprint from the *Archives of Medicine*, Dr. Edward Seguin gives a description of "the psycho-physiological training of an idiotic hand;" an admirable description of the education of an idiotic boy, such as few besides himself could either accomplish or describe.

——Part VI of Dr. Duhring's *Atlas of Skin Diseases* contains plates of syphiloderma, erythema nodosum, seborrhœa, and papulous eczema. The chromo-lithographic plates are colored, and printed with the utmost fidelity, and as typical examples of the diseases they represent, come up to the most exacting standard. The text, as usual, is brief and practical. Published by J. B. Lippincott & Co., Philadelphia.

——A Committee of the Iowa State Medical Society, Dr. W. S. Robert on Chairman, have

drafted an Act to establish a State Board of Health in the State of Iowa; to provide for the appointment of a Superintendent of Vital Statistics; and to assign certain duties to local Boards of Health; to present to the next assembly. Copies can be had by addressing Dr. Robertson, at Muscatine, Iowa.

——No. VII of the American Health Primers, edited by Dr. W. W. Keen, is upon "The Mouth and the Teeth," by Dr. J. W. White. He describes the anatomy and development of the teeth, the care of temporary teeth, their shedding and the eruption of the permanent teeth, the relation of food to teeth, their irregularities, defects, decay and hygiene, and artificial dentures. A large amount of information is conveyed in a direct, unostentatious style, and we should not be surprised if this were one of the most popular members of the series. Published by Lindsay & Blakiston, Philadelphia.

——A subscriber, who has our thanks, though he doesn't give us his name, has sent us a copy of Dr. Shipman's translation of the late Dr. Von Grauvogl's brochure, entitled, "The Homœopathic Law of Similarity." We presume the anonymous donor either expected it to convince us, or wanted it criticized. As it has failed of the first effect, we treat him to the second. The radical scientific error of all dogmatists is in their ignorance of the meaning and scope of what is called "natural law." This is exhibited most strikingly on page 9 of this work, where the author undertakes to prove that by the process of *abstraction* we can reach from a single case the same certainty as by the process of induction. Any one even superficially acquainted with the logic of the sciences will see the absurdity of this statement; but upon it rests the whole argument of the book. *Sat. sap.*

BOOK NOTICES.

A Text Book of Physiology. By M. Foster, M.A., M.D., F.R.S. With illustrations. Third edition, revised. London and New York, MacMillan & Co., 1879. Cloth, 8vo, pp. 720. Price, cloth, $3.50, sheep, $4.50.

Dr. Foster's book is an admirable production, and for the physician whose physiological reading has lain fallow for years, and who wants to renew acquaintance with that science in its modern phase, we know of no more refreshing volume to recommend him. The writer starts by taking the simplest organism known to biologists, the Amœba, and ascertains its fundamental vital properties. Upon these he builds the physiological classification of the tissues of the human body, which he discusses, one by one, in the order of their native prominence. The blood, the contractile tissues, the nervous tissues, the vascular mechanism, the tissues of chemical action, of reproduction, of nervous action, etc., form subjects of chapters and sections. Thus, in a thoroughly philosophical, and yet strictly simple and direct, manner are all the parts and functions of the body displayed.

The author often suggests much that as yet cannot be expressed in terms of knowledge, and which offers food for thought and study, as when he proposes the question how far the rhythm of the heart is the result of cosmical changes, or how far it is the outcome of the inherent vibrations of its constitutional molecules. The chapter on the "phases of life" has several such glimpses into possibilities.

The present edition has been carefully revised, and is issued in good style, and the publishers announce that a cheap student's edition will shortly be ready.

The Medical Register of New England. By Francis H. Brown, M.D. Boston, Houghton, Osgood & Co. 12 mo., pp. 450.

In this edition of his meritorious work, Dr. Brown has made considerable additions to previous ones, and we believe that every New England physician would find in it considerable matter which he would like to know. There is first a description of all the medical associations and societies; then medical schools, hospitals, dispensaries, asylums, boards of health, medical libraries, museums, prizes, etc. The directory includes not only physicians, but chemists, veterinary surgeons, leechers, instrument makers, nurses, etc.

Infant Feeding, and its Influence on Life. By C. H. F. Routh, M. D. Third edition, 1879. Wood's Library of Standard Authors.

Dr. Routh first brought out this treatise about twenty years ago, and as he has been in active practice ever since, he has had ample opportunity to test the validity of the views he puts forth. He has the reputation of being idiosyncratic, not to say notional; but the examination we have given this book has not revealed any singularities of importance. It is surprising that he says nothing of condensed milk; and several recent and popular "infants' foods" are likewise not mentioned. The second part of the work contains some valuable chapters on lactation.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Half-Yearly Compendium of Med. Science,	2.50
Reporter and Compendium, - - -	7.00
Physician's Daily Pocket Record, - -	1.50
Reporter and Pocket Record, - - -	6.25
Reporter, Comp. and Pocket Record, - -	8.25

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,
115 South Seventh Street,
PHILADELPHIA, PA.

THE STUDY OF NEW REMEDIES.

With regard to new remedies, a great many physicians take one of two sides; either they are like the ancient Greeks, lovers of novelty, and ready to run after almost any new thing; or they are hidebound and stiffbacked, refusing to use or to try anything until they are forced into it by the demands of their patients or the success of their competitors.

It is needless to say that both these camps are in the wrong, and that here, as in so many other matters of conduct, the middle way is the safest. Progress comes by proving all things and holding on to that which is good—quite as much in the holding on as in the proving, however. Physicians must exercise greater caution in testing novelties than any other branch of investigators. They deal in human life and human fate, and pain and death follow the tracks of experimenters in these precious articles. It was long since said, by an eminent English surgeon, that two results followed him who tried many new remedies—he soon lost his patients, and soon had no patients to lose. For all that, it is blind conservatism to refuse the aid of fairly approved methods because they are novel.

No doubt the woods and fields of this country hold plants whose virtues would be as beneficial, if known, as cinchona and ipecac.; no doubt chemistry will discover more valuable agents than chloral and carbolic acid. Hence no one should turn his back on these fruitful and promising fields of research.

Especially does the indigenous botany of the United States deserve the close scrutiny of medical men for plants of medicinal powers. Hitherto there has been no systematic and scientific course pursued in its investigation. The traditions of frontiersmen or the recipes of old wives have guided the inquirer more than anything else; and it must be added that those who have most profited by it have not been the regular profession, but the members of narrow sects, botanic and eclectic doctors.

It is time that this should cease, and that scientific medical men should address themselves to ascertaining what are the actual properties of the numerous plants with therapeutic powers. In the first place, every such plant should be correctly identified. For this, the common name is but little guide. In different parts of the country the same name is applied to several diverse plants; or several are jumbled under one. For example, no less than nineteen different species of plants, belonging to eight different genera, are known as "snake root" in various parts of the United States; under the allied names "squaw root," "squaw weed," or "squaw bush," plants belonging to nine different genera are designated. Hence it is absolutely impossible to secure any accuracy from such appellations.

Having identified the plant, the next step should be to collect from literature, both medical and popular, its claims as a therapeutic agent. Common and trivial sources should not be despised. Open secrets of value have lived for generations among the populace, disregarded by the profession. Much has been learned by

surgeons of this generation, from the popular arts of "bone-setting."

These claims thus collected, the investigator should take the plant to the laboratory, and study its physiological properties by experiment, and its chemical and pharmaceutical constituents, its proximate principles and active alkaloids, its most active preparations, and its parts most fully developing its special properties. This is a long labor, but an essential one. Here the assertions of the multitude are brought to the first test of their value.

Finally, its actual effects in disease should be observed, both in those maladies which first gave it a claim to be noticed, and in those for which its physiological properties would appear to adapt it. For this purpose, specimens of the most efficient preparation, properly put up, and accompanied by a statement of what previous study had elicited, should be placed in the hospitals and dispensaries, and in the hands of physicians best calculated to observe and report correctly.

The sum of these reports, analyzed and presented in compact form, would either indicate the inertness of the plant, or give it, provisionally, its proper position in the materia medica.

This scheme, indeed, involves vast labor if applied to any great number of claimants for recognition: but the work once done, it would stand, and little by little the field could be gone over, and satisfactory results reached. Moreover, it is not entirely fresh, and there are already scattered in numerous books, journals, and monographs, a great deal of information, little known because so scattered, which could be utilized.

THE REPORT OF THE SURGEON-GENERAL.

The annual report of the Surgeon General, U. S.A., for the year ending June 30th, 1879, has been published. It informs us that the average mean strength of the army is, whites, 21,710, colored troops, 1947. The average number of the former constantly on sick report was 44 per thousand, and the deaths 12 per thousand. The average number of the colored troops constantly on sick report was 40 per thousand, and the deaths 14 per thousand.

The enormous amount of work in the pension and record division of the Surgeon General's office may be judged from the fact that the number of new official demands upon this division during the fiscal year, for information as to the cause of death in the case of diseased soldiers, and the hospital record of invalids, was 22,339. Of these, 19,427 were from the Commissioner of Pensions, 2498 from the Adjutant General of the Army, and 414 from miscellaneous sources. The total number of new cases was greater by 1265 than the number received during the previous fiscal year, and greater by 1954 than the average number of new cases received annually during the nine previous fiscal years. In addition to this large number of new cases, the Division was burdened, at the commencement of the fiscal year, by a heavy amount of arrears from former years.

This sudden increase in the number of new cases sent to the office is consequent upon the operation of the Act of Congress approved January 25th, 1879, granting arrears of pensions, etc., and especially the operation of the third section of said act, which repeals the statute imposing certain limitations in the prosecution of pension claims. By the provisions of that Act a large amount of additional work has been thrown upon the Pension Office, and a very considerable proportion of the new cases are necessarily referred to this office for the hospital records of the soldiers concerned. Hence, the Surgeon General very properly asks for additional clerical assistance, in number, about forty additional clerks.

The Army Medical Museum has been considerably increased in all its sections. The Medical and Surgical History of the War has proceeded to Part III, which will complete the work, and both volumes of this part are well under way.

About 3000 volumes, and 3500 pamphlets have been added to the Library during the past year, making the total number about 49,000 volumes, and 53,500 pamphlets.

The first part of the Index Catalogue has been sent to press, an appropriation having been granted by Congress, at its last session, for printing the first two volumes.

Of 130 applicants for the post of Assistant Surgeon, 13 had been found qualified, out of 92 examined.

At the date of the last report there existed fifteen vacancies in the Medical Corps, in the grade of Assistant Surgeon. During the past year one Surgeon, with the rank of Major, has been retired; one Surgeon, with the rank of Major, and one Assistant Surgeon, have died; one Assistant Surgeon has been dismissed; two Assistant Surgeons have resigned, and seven appointments of Assistant Surgeons have been made; leaving, at the present time, two vacancies in the grade of Surgeon, with the rank of Major, and twelve in the grade of Assistant Surgeon.

The deaths occurring among Medical Officers since the last report are as follows:—

Major Samuel A. Storrow, Surgeon, died at San Francisco, California, July 12, 1879.

Captain Jenkins A. Fitzgerald, Assistant Surgeon, died at Columbia, Pennsylvania, August 11, 1879.

Brigadier General Clement A. Finley, Surgeon General (retired), died at his residence in West Philadelphia, September 8, 1879.

Notes and Comments.

Therapeutical Notes.

SEBORRHŒA OF THE SCALP.

Dr. L. D. Bulkley, in moist seborrhœa, washes the scalp with—

℞.	Saponis viridis,	℥ iv	
	Alcoholis,	℥ ij.	M.

Use every third night.

And apply every night—

℞.	Acidi tannici,	℥ j	
	Unguenti petrolei.,	℥ j.	M.

Rub well in to the roots of the hair.

After the ointment has been applied a week or so, change it for the following lotion:—

℞.	Acidi carbolici,	℥ ss	
	Glycerinæ,	℥ j	
	Aquæ rosæ,	℥ iv.	M.

In dry seborrhœa the treatment is the same, except that in place of the tannin the application should be citrine ointment, diluted with three times its amount of aquæ rosæ (*Archives of Dermatology*).

WASH IN POST-NASAL CATARRH.

In post-nasal catarrh, for cleansing and stimulating the membranes, Dr. Carl Seiler, of this city, uses the following, with beneficial results—

℞.	Zinci sulphatis,	gr. x	
	Tinct. benzoini comp.,	℥ j	
	Aquæ destil.,	Oj	M.

Employ with the nasal douche.

WASH IN FETID CORYZA

In chronic coryza, with fetid secretion—a most unpleasant affliction—Dr. J. Solis Cohen says that the most efficacious wash he has employed is—

℞.	Aquæ chlorinii,	℥ j
	Aquæ,	Oj.

Use with the nasal douche.

The skin, kidneys and bowels must be kept active by frequent bathing and an occasional purge. A cure requires months of treatment.

Condensed Milk as Infant Food.

The evidence seems pretty conclusive that this preparation is not suitable as a regular dietetic in infancy. A correspondent of the *British Medical Journal* states that his experience has been, that while in many cases of diarrhœa it is an extremely valuable medicinal agent, yet, as a daily article of food, it proves most deleterious, the infants often appearing to thrive while taking it; but this is true only as far as fat is concerned, for the bones too often become rickety, the skin covered with eczematous and other eruptions, and if attacked with severe illness, the little patients quickly, and often suddenly, succumb. That many children are brought up on the condensed milk to the satisfaction of their parents cannot be denied, but that the consequences are often injurious, is equally certain.

Fatal Asphyxia Occurring at Remote Periods after Anæsthesia.

In the *Gazette des Hopitaux*, Nos. 80 and 103, an account is given of a case which occurred in Prof. Richet's practice, of a patient who, having inhaled chloroform during amputation of the breast without any immediate ill effects, was seized on the second day after the operation with bronchitis, with suffocating breathing, which proved fatal. Four similar cases occurred in M. Richet's practice which pursued the same course, one of the features in common being their occurrence in obese persons.

Position in Removing Foreign Bodies from the Ear.

It is mentioned in the London *Medical Record* that Prof. Voltolini relates the case of a boy, aged 3¼ years, from whose ear he removed a glass bead, by syringing, according to the following method. The patient's head is placed in such a position that the upper wall of the meatus is lowest, and *vice versâ*. This is accomplished by laying him on his back on a table, and allowing the head to hang over the end. The auricle is at the same time drawn in the usual direction. The advantage of this method, according to the author, rests on the fact that (owing to the oblique position of the drumhead), when the position of the head is reversed as above, a foreign body lodged in the hollow formed by the membrane and the lower wall of the meatus, will, when set in motion by a stream of water, roll along the inclined plane formed by the drumhead, and thus be washed out along the upper wall of the meatus. In the present case the bead was easily removed by this method, although syringing *in the standing posture* on the previous day had failed to bring it away.

Alligator Oil.

Years ago alligator oil was obtained in large quantities in Florida, and was used generally for burning and lubricating purposes. The fat is principally found on the tail and around the intestines. An East Indian physician states that crocodile oil, which is probably substantially the same, contains a larger proportion of solid fat than either the neat's-foot or cod-liver and other fish oils. It solidifies at the melting point of ice, while neat's-foot oil only slightly thickens, and the others scarcely thicken. He also tried the softening quality of the various animal oils on leather, and on comparison found the leather treated with crocodile oil remained much stiffer than that treated with other animal oils. Whether there is any dietetic or medicinal use of alligator oil we have not heard.

Relation of Age to Typhoid Fever.

Although typhoid fever is much more common in youth, it is not altogether rare in persons of advanced age—over fifty, for instance. Dr. Murchison records that of 1772 cases at the London Fever Hospital, 26, or 1.5 per cent., exceeded that age—a proportion which is larger than at first appears, when it is remembered that less than one-seventh of the entire population of England and Wales is constituted by persons above fifty, and that many who survive that age have acquired an immunity from the disease by a previous attack. Nine cases were noted at the Fever Hospital above sixty; one of them, a man, had rose spots, and called himself seventy-six, but did not look more than sixty. Trousseau records the case of a woman, aged sixty-four, in whose body the characteristic abdominal lesions were found after death. These lesions have also been found by Wilks, in a woman, aged seventy; by Lombard, in a woman, aged seventy-two; and by M. d'Arcy, in a woman, aged eighty-six.

Poisons and Antidotes.

In an interesting article on this subject, by Dr. F. A. Falck, which we find referred to in Schmidt's *Jahrbücher*, the writer points out that the so-called antagonism of opium and belladonna was noticed by Albinus and others, as early as 1570. A real antagonism does not exist, according to Falck. His conclusions are as follows:—

1. Atropin is a true antidote for muscarin; but not the latter for the former.
2. Duboisin is also a true antidote for muscarin.
3. Atropin and duboisin are also antagonistic to pilocarpin.

Atropin and physostigmin,
Strychnin and chloral hydrate,
Chloral hydrate and atropin,
Morphine and atropin,

Are all respectively antidotal in a pharmacological sense, but not in a physiological one. That is, the one will diminish the symptoms caused by the other, but will not produce contrary physiological effects.

The Relations of Cardiac and Gastric Disease.

At the last meeting of the French Association for the Advancement of Science, M. Teissier, Jr., said he had met with about a dozen cases of heart disease that could be traced back to gastro-hepatic troubles. The affection was developed very slowly and gradually. One of its first symptoms was the abnormal loudness of the second sound of the heart; later on, the same sound became double, and finally was transformed into a blowing murmur, connected with insufficiency of the tricuspid valve and a venous pulse. M. Teissier attributed the origin of this secondary affection to a peculiar condition of irritation of the sensory fibres of the abdominal sympathetic nerve, which is transmitted to the pneumogastric nerve, and gives rise to a spasmodic contraction of the pulmonary vessels. This tends to increase

the blood-pressure within the pulmonary circulation; the right heart is forced to overwork, and finally undergoes very serious structural alterations (dilatation, hypertrophy, and relative valvular insufficiency). In the discussion which followed, M. Francois-Franck remarked that the disturbances might perhaps rather be accounted for as caused by the cervico-thoracic portion of the sympathetic nerve.

Swallowing a Safety Pin.

A remarkable case is reported to us in a letter from Dr. G. S. Trezevant, of Columbia, S. C. A little girl, three and a half years old, swallowed what is known as a safety or diaper pin, the point of which rests in a sheath when closed, but when not, opens, by a spring, to the width of ¾ of an inch. This formidable apparatus was swallowed when opened. Dr. Trezevant's advice to the parents was to abstain from all medication, as the only hope for the child's safety was for the pin to become imbedded in the fæces, so as to guard the point, and to feed the child on such nourishment as would favor constipation. The little girl did not have an ache or pain; bowels open regularly once every day. Two weeks, exactly, after the pin had been swallowed, it was passed, imbedded in the solid fæces.

We would call attention to the sound wisdom of this advice. It was exactly right; yet we have known physicians who, in similar cases of swallowing foreign bodies, advised spare diet and cathartics. Nothing could be further from correct practice.

Limits of the Animal and Vegetable Kingdoms.

The *Journal* of the Franklin Institute observes that Prof. Stein, in his beautiful work on the flagellate Infusoria, distinguishes the lowest animals from vegetables by the simultaneous presence of vibratile cilia, contractile cavities and a nucleus. Protozoans have all three of these organs, but he thinks this cannot be said of any vegetable. E. Maupas shows that the zoospores of two Algæ, the *Microspora floccosa* and an unclassified *Oedogonium*, have well marked nuclei, together with the cilia and contractile cavity, and concludes that neither physiology nor morphology furnish any criterion for distinguishing animals from vegetables. Claude Bernard has established the biological unity of all living organisms, and protozoans and protophytes can only be classified by means of their tendencies and affinities.

The Solar Cautery.

Referring to the opinion expressed in this journal, that the solar cautery has no practical value, the junior editor of the *Pacific Medical and Surgical Journal* states that he is in possession of ample evidence to the contrary, which he courteously offers to adduce. It would give us much pleasure, personally, to witness his use of the cautery, but circumstances forbid. Our opinion was based on our own experiments with the cautery, and by the fact that it has been found unmanageable by most surgeons, and after having been repeatedly introduced, has always fallen into desuetude. There may be a *tour de maitre* in its use which we and others never caught.

Iodide of Potassium and Calomel in Ophthalmology.

Dr. Schlæfke (*Græfe's Archiv*, vol. xxi. 2, p. 251) refers to the fact which has frequently been observed, that the external application of calomel may give rise to severe inflammation of the conjunctiva, if used simultaneously with the exhibition of KI internally. This he explains by the formation of iodate and iodide of mercury, which, in the presence of common salt, or KI, are soluble, and act as caustics. He finds that if KI be taken twice daily in 0.5 grain doses, its presence can be constantly detected in the conjunctival sac.

Bandaging the Infant.

As evidence in favor of dispensing with bandaging infants at birth, Dr. O. P. Langworthy, of Louisiana, writes us, that of late years he has entirely abandoned this ancient ceremony, and that in the now very large number of cases where he has not applied the bandage not one gave any subsequent trouble, so far as the condition of the umbilicus was concerned. In one or more cases which he can recall, he is of opinion that fatal attacks of trismus nascentium were directly due to the bandaging.

Correspondence.

A Case of Strychnine Poisoning.

Ed. Med. and Surg. Reporter:—

On Sunday, the 12th of October, at six o'clock P.M., I was summoned in haste to see Mrs. Miller, three miles in the country, who, as the messenger stated, was suffering from severe pains in the abdomen. As I was about to start and see another patient, my friend Dr. N. Magee, who was visiting me, kindly offered to go for me, and

did so, arming himself with my hypodermic syringe. When I returned home, Dr. M. was not back, and had sent word that I should come. When I arrived at the patient's house, at about half-past nine P.M., I found beside my friend Dr. M., Dr. Newmann, a neighbor, not now practicing, present. Dr. M. now reported as follows: Arrived at half-past six P. M.; found patient, a plethoric woman of about fifty-six years of age, in bed, almost constantly in convulsions, of a tetanic character, with but little opisthotonos, and face livid. These symptoms at once induced him to suspect poisoning by strychnine; as the pulse was strong and full, he at once took away about a pint and a half of blood from her arm; after this the convulsions ceased immediately, and the patient was able to answer questions; drank some water, and then stated that she had taken poison (procured in the Waubeka drug store) at five P.M. Now an emetic was administered, and soon after large masses of coagulated milk, of a very bitter taste, was thrown up; now plenty of water was given, which was several times rejected, and as the convulsions returned, half a grain of sulphate of morphia was injected, hypodermically. After this the patient had been quiet for about fifteen minutes, when the convulsions set in again, coming oftener and oftener, when another half grain of morphia was injected. After this the patient had been quiet for nearly half an hour, when the spells returned, at first at long intervals, but they were about as often as at first when I arrived. I could, at any time, bring the convulsions on by slightly knocking against the foot of the bed or by blowing in the patient's face. Water she took always, readily.

As we had no chloroform nor chloral hydrate at hand, I proposed an injection of atropine; to this the other gentlemen consented, and at 10 P.M. I injected $\frac{1}{4}$ grain of sulphate of atropia, in the arm. Almost immediately after the respiration became somewhat stertorous and the face very livid: water was swallowed with great difficulty. The convulsions ceased entirely and could not be brought on by noise. This critical condition lasted about ten minutes, when profuse perspiration broke out, the respiration becoming almost imperceptible, but of the natural number; water was again swallowed and patient responded to questions. During all this time the pulse remained about 100 per minute. We now waited half an hour, and as, after this time, no convulsions could be brought on, and patient was quietly slumbering, we concluded to go home, leaving half a grain of sulphate of atropia in three ounces of water; a teaspoonful to be given every two hours, and a powder of half a grain of morphia, to be given should the convulsions return. It was now 2 o'clock Monday morning.

On returning, at 9 A.M., we were greatly surprised to find our patient sitting in bed, perfectly rational, only complaining of great thirst, and a feeling of lameness all over; there was no paralysis and but little dilation of pupils; all food was rejected by the stomach. The atropia was now dispensed with, and the gastric symptoms properly attended to; as the bowels had not moved, an injection was administered, which was soon followed by a copious discharge, and on Wednesday, the 15th, we could pronounce our patient well.

Peculiar about this case is the large dose—4 grs. of nitrate of strychnia was taken—the remedy used, and the long time ($1\frac{1}{2}$ hours,) which elapsed before she had help. As a motive for taking the poison, she gave a long standing tinnitus aurium and the loss of a daughter. The poison she had procured the day previous, in the Waubeka drug store, asking for some rat and some fox poison; the druggist gave her half an oz. of arsenic for the rats, and 4 grs. of strychnia, in a vial, for the fox. She had emptied the vial containing the smaller quantity in a glass of wine, stirring well with her finger, and had taken it all.

Waubeka, Nov. 18th. J. N. VOJE, M.D.

Sulphur in Diphtheria.

ED. MED. AND SURG. REPORTER:—

In your Nov. 8 issue of the REPORTER I see another communication on sulphur in diphtheria. The other article soon got into the newspapers, and in one week was in every family in the country. I had, at that time, thirty-seven children sick with diphtheria, and most of them very bad cases. All, at one round—after getting their weekly paper—wanted me to use sulphur, for "the paper said it never failed." I told them it could do no good; but that would not do; "the paper said it would." I told them of the danger of blowing the powder into the throat; but no words would satisfy; and, beside, an advertising doctor in our county seat had sent out word that he could cure them at one visit by the use of sulphur. Now he had no cases on which to try it; but he, like the other silly ones, had read the papers. What was I to do? Knowing that glycerine was good in all throat troubles, and the only thing sulphur will dissolve in to any advantage, I put the sulphur in glycerine, and gave it long enough to make the parents understand that unless I changed the medicine they would all die. But the silly and unscientific prescription of the author made me more trouble than all the *tomfooleries* I ever had to deal with. I not only lost time—which is very valuable in diphtheria—but lost one patient, who, I am satisfied, would have recovered had I taken my way. Sulphur has no more influence over diphtheria than dirt. I had nearly three hundred cases before it stopped, and I only lost the one in the first round; many of them were complicated with capillary bronchitis. In diphtheria I use potass. chlor. and mur. tr. ferri, with whatever other medicines the symptoms call for. I always treat diseases by symptoms, and not by name. Diphtheria comes in all localities, and the man is foolish who thinks he can control it by attention to sewers and other regulations. If "A City Physician" would go into the country and practice a year, he would know more than he does when he writes on these subjects and their treatment. But in regard to potass. chlor., many have been deceived. Why don't they try and see how much potass. chlor. will dissolve in a given quantity of water? If they would do this they would never again make themselves ridiculous in a medical journal. One man said, in the

Reporter—I cannot hunt it up now—that a boy took ʒ iss in a day. I wonder how often and in what sized doses he took it? ʒ viij will dissolve ʒ iij of the drug. Now the whole ʒ iij will not hurt him at one dose; and we presume he made sixty-four doses out of it. The fact is, when a doctor thinks his patient has died from potass. chlor. it has died from some trouble the doctor did not understand. I have given it, in all the strength it could be dissolved, to an *infant*, in ʒ j doses every hour, with no bad results. If you have a case of diphtheria give potass. chlor. and mur. tr. ferri often, and if the tongue is white, give also sulphite soda, and follow up all the symptoms, and if any die you will not be to blame. Sewerage has nothing to do with diphtheria; for the best country families, with the best possible location, have it, the same as the poorest and least looked after. Whenever you can control the forty-five miles of atmosphere you can control diphtheria and all atmospheric troubles—not before. Jos. Boker, M.D.

Adair, Ill., Nov. 11, 1879.

[Sulphur has a fair amount of support as a remedy in diphtheria, and that from very careful observers. But no sensible man thinks it a specific. In reference to the solubility of chlorate of potash, accurate results were published by Dr. Drysdale, of this city, in the Reporter, Vol. xxxvi., p. 238.—Ed. Rep.]

Multiple Gestation, Hemorrhage, and Asphyxia of Infants.

Ed. Med. and Surg. Reporter:—

In your journal of November 29 is detailed a case of dual birth, interesting for the spontaneous version of the second fœtus. The treatment of the case has some points that invite examination. Some one of my masters in the obstetric art taught me that immediately a fœtus was expelled from the womb I should place my hand upon the abdomen of the mother, that it might be ascertained whether there were other living beings still to be born, and that the womb might be caused to contract upon its contents, as a safeguard against hour-glass contraction of the womb and uterine hemorrhage. If one proceeds to withdraw a placenta that is still nourishing living beings shut up in the womb, death must result to them.

In the hemorrhage incident to the case related, the declaration that death must have ensued but for the injection of vinegar into the womb is surprising, in view of one's own experience. The writer vividly recalls a case in which flooding was so sudden and profuse as to threaten instant destruction to life. There was no syringe nor any vinegar at hand; but the alarming torrent was immediately staunched and controlled by including the abdominal walls and uterus in the grasp of the hand, thereby enforcing firm contraction of the uterine walls and the gaping vessels. At the proper time, a bandage, so applied as to make firm pressure upon the organ, and the administration of ergot, never failed to stay the fountain of blood.

The simplicity and readiness of application of this procedure commend it as far preferable to the disagreeable and troublesome measure recommended by the author of the case, and vastly so to the painful and heroic treatment of the distinguished professor.

In the resuscitation of asphyxiated infants, newly born, I have long used a procedure embodying the principles of the Marshall Hall method, viz: By tossing the child, with a quick motion, the placenta being still attached. The rapid movement causes the arms to fly up, lifting the chest walls, and causing the infant to take in air by a sudden sob. The method may appear rather rude, but it has succeeded in many cases apparently desperate. It has the merit of instant applicability, with very quick results, and experience with it induces me to believe it unfailing in the recovery of newly born infants perishing from asphyxia. E. T. Blackwell, M.D.

Hackettstown, N. J.

News and Miscellany.

The Jefferson Medical College Hospital.

The annual meeting of the trustees was held last week. From the reports it appears that during the fiscal year ending September 30th, 1879, 642 patients were received and treated in the hospital wards. Many of these were suffering from severe maladies, and underwent surgical operations of greater or less magnitude. The number of persons who presented themselves as out-door patients at the various clinics was very large. At the surgical clinic 7661 visits were paid; at the medical clinic 5456, and at the different special clinics, 11,115, making in the aggregate, a total of 24,232 visits for the year. There has also been established, during the last year, under the auspices of the Board of Trustees, a valuable pathological museum, which already numbers 500 specimens. These comprise wax models, casts, and other illustrations of injury and disease. Great care has been exercised in their preparation and selection, and the collection, as it increases in size, will undoubtedly prove of much service in exemplifying and illustrating the clinical lectures delivered in the institution.

Some Sad Things.

In the Louisville *Medical News*, Nov. 29th, Dr. L. P. Yandell publishes a "withdrawal" of his charge against Dr. William L. Hammond, of having made use of Prof. Charcot's work and its engravings without acknowledgment. Dr. Yandell does this only after Prof. Charcot, in the most positive terms, had informed him that he (Charcot) had never said anything which could be so construed, and in fact was, at the time, fully aware that Dr. Hammond had given ample credit for all that he had borrowed, and after Prof. Charcot had demanded the publication of this statement.

Dr. Yandell moralized on his imaginary discovery of this pretended literary theft, as follows: "It is sad, indeed, to think that science does not entail honesty, etc." Yes, it is sad, very sad. We entirely sympathize with him. Another thing is also sad; that when one gentleman has

been proved to have grossly maligned another, owing to his ignorance, we will say, of the French language, he makes no apology whatever to the person so maligned, but contents himself with a simple withdrawal, which, *du reste*, has been forced upon him. This also is sad.

Items.

—*Correction.*—The ℞ for dropsy, p. 459, is intended to make 24 ounces, and water should be added to that amount.

—A pair of female twins, united from the breast bone to the lower part of the abdomen, is reported from Bombay. They are eight months old and in good health.

—A concours for a lectureship on gynecology, in the spring course of lectures at Rush Medical College, Chicago, will be held January 6th, 1880. Particulars can be had of the Secretary, Dr. J. H. Etheridge.

—Eight hundred new students have matriculated, this fall, in the London Medical Schools. There is in Great Britain an increase of physicians, faster, in proportion, than the rate of population.

—A leading wholesale drug house in St. Louis sold, in 1878, for two months in the fall, quinine at the rate of a thousand ounces a day. This year their sales at the same time did not average over one hundred ounces a day. Such has been the decrease of malarial diseases the past autumn.

—Dr. C. D. Phillips, of London, has recently recovered $80,000 from the London and Southwestern Railway Company, for damages resulting from an accident on their road. This is the heaviest sum we remember to have seen allowed in such a case.

—A great deal of nonsense is being published about the benzoate of sodium as a remedy in puerperal septicæmia, pyæmia, scarlet fever, diphtheria, and not least, in phthisis. It is said that in Vienna the demand exceeds the supply. It is evident, on the face of the reports of its use, that they are utterly untrustworthy.

—Malignant diphtheria has been prevalent in Lancaster City and county, Pa., for several months. At a meeting of the Lancaster County Medical Society, December 3, the members from different parts of the county reported a decided abatement in the malignant type of the disease, though in a milder form it still prevailed throughout the city and county.

OBITUARY NOTICES.

Robert F. Baldwin, M. D.,

Superintendent of Virginia Western Hospital for the Insane, died at the Hospital, Staunton, November 21st, at the age of fifty years, of malignant bleeding fungus seated in the left orbit, and invading the cerebrum. Three years previously, Dr. Chisholm, oculist, of Baltimore, had removed the eye, affected at the time with a tumor pressing upon the optic nerve. The fungus developed within a few months past, resulting in death. Dr. Baldwin was graduated in medicine at the University of Pennsylvania, in 1851, having previously taken a course of study at the University of Virginia. In a former number of the MEDICAL AND SURGICAL REPORTER brief details of the successful treatment of the case of the father of Dr. Baldwin were given, proving the avoidance of an operation for cancer, with which he was afflicted, is sometimes the best rule. At the time, the son was in the enjoyment of robust health, and was the most eminent surgeon, obstetrician and physician in Winchester. He was unanimously elected to fill the vacancy which occurred in the Hospital for the Insane by the death of Dr Stribling. This position he filled with honor and efficiency. In it, it is worthy of mention, he carried out the methods of treatment of the insane for which his predecessor, Dr. Stribling, had been so distinguished; particularly his system of furloughing patients that were in a convalescent state. In the midst of great financial depression in Virginia, Dr. Baldwin's personal influence prevailed with the Legislature of the State, to make liberal appropriations for the support of the hospital. His uniform, cheerful, and even humorous disposition, eminently fitted him to care for the insane. As a Christian, he was able to direct the sufferer to Him, Omnipotent; to comfort and heal, when the counsels of others who practice the oppositions of science, so-called, would prove worthless. Dr. Baldwin was, for many years, a consistent member of the Protestant Episcopal Church.

F. H., Jr.

QUERIES AND REPLIES.

Dr. Herdon. We doubt the propriety of attempting to cram the metric system down the throat of the profession, as it were. At present, it is clear neither pharmacists nor physicians, in any great numbers, desire its introduction.

Dr. H. K. S., of Wis.—Your article, though suitable in other respects, is too long for this journal. We cannot make room for it. MSS. are returned when stamps are sent for that purpose.

Dr. Calvers. The late Dr. Bumstead was a nephew of N. P. Willis, well known as a *literateur*.

Dr. J. N. P., of Ind.—Your request to republish Prof. Smith's method of reducing the humerus received, and we shall endeavor to do so some time this winter.

Mr. T. J., of N. Y. It is a rule with editors of medical journals not to prescribe for cases through the columns of their journals.

MARRIAGES.

CAREY—STEWART.—On the 23d of November, 1879, by the Rev. J. Garnett, Mr. John W. Carey, M.D., and Miss Rebecca E. Stewart, all of East Sanday, Venango Co., Pa.

HALE—KING.—At Keokuk, Iowa, November 4th, by the Rev. W. G. Craig, W. W. Hale, M.D., of Centerville, Iowa, and Miss Ella King, of Keokuk.

MACKIE—TROTTER.—On the 20th ult., at St. Luke's Church, this city, by the Rev. William W. Farr, Dr. Benjamin S. Mackie, U. S. Navy, and Mary F., daughter of William Henry Trotter.

MORRIS—REMINGTON.—On the 19th ult., at St. Mark's, this city, by the Rev. W. Neilson McVickar, Dr. Caspar Morris, Jr., and Laura, daughter of the late Thomas P. Remington.

O'NEILL—CHANDLER.—On the 20th ult., at St. James' Church, by the Rev. Henry J. Morton, D.D., assisted by the Rev. W. Neilson McVickar, J. Wilks O'Neill, M.D., and Florence Emilie, daughter of William Penn Chandler, all of this city.

DEATHS.

BUMSTEAD.—In New York City, November 28th, Freeman J. Bumstead, M.D., aged 53 years.

SAWYER.—In Springfield, Vermont, November 7th, Langdon Sawyer, M.D., aged 61 years.

THORN.—At his residence, Millbrook, N. Y., Nov. 11th, Dr. John S. Thorn, in the 59th year of his age.

WRIGHT.—In New York, on Monday, Nov. 17, 1879, Mrs. Emma Scott Wright, M.D., aged thirty-one years.

HORSFORD'S
Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges

MANUFACTURED BY THE

RUMFORD CHEMICAL WORKS,

1155-1206 PROVIDENCE, R. I.

OPERATIVE SURGERY.
A MANUAL OF THE PRINCIPLES AND THE PRACTICE OF OPERATIVE SURGERY. By STEPHEN SMITH, A.M., M.D., Surgeon to Bellevue and St. Vincent Hospitals, New York. Fully Illustrated. One volume, crown 8vo, 697 pages, cloth, $4.00; roan, $4.50.

This volume is a handy book for the practitioner, and by means of a full index is adapted, for instant reference, to all the details of operations.

Though of great value to all professional surgeons, the book is peculiarly useful for physicians who rarely have surgical cases, and who will find the explicit directions and illustrative cuts in this work instantly helpful in emergencies and specially difficult cases.

Illustrations form a very important feature. These have been prepared with special care, for the purpose of rendering the text clear, and of presenting distinctly to the eye the more obscure points of surgical operations.

"I believe I am perfectly familiar with the literature of surgery, and if there is any work of the kind equal to yours, in any language, I am not acquainted with it. This is saying a great deal, but only what is strictly true.—PROF. S. D. GROSS, *Professor of Surgery in Jefferson Medical College, Philadelphia, Pa.*

"The plan of the book is entirely new, and it has been carried out with a completeness which leaves nothing to be desired. Like everything which comes from Dr. Stephen Smith, it is well done, and is sure to be successful."—PROF. FRANK H. HAMILTON, *New York.*

For Sale by Booksellers. Sent, postpaid, on receipt of the price by the Publishers.

HOUGHTON, OSGOOD, & CO., Boston;
21 Astor Place, New York.

TWENTY-THIRD YEAR OF PUBLICATION.

—o—

An Entirely New Edition of

THE PHYSICIAN'S HANDBOOK, FOR 1880

IS NOW READY,

Containing all the New Remedial Agents to date.

By WM. ELMER, M.D., and A. D. ELMER, M.D.

—o—

Bound in English morocco, red edges, pocket-book form, with tucks. Price $1.75 with printed matter, and $1.50 printed matter omitted, postage free.

This popular STANDARD MANUAL has been **thoroughly revised** and **entirely rewritten,** with valuable improvements added. This edition will contain all the recent discoveries in Materia Medica and Therapeutics, to the present time.

The HANDBOOK contains three hundred blank pages, arranged in diary form for THIRTY-FOUR or SIXTY-EIGHT PATIENTS, and so ruled and divided as to admit of a complete and compact record of professional practice.

☞ On receipt of $4.00, "Handbook," "Braithwaite," and "Physician's Monitor," for one year, free of postage.

PUBLISHED BY

W. A. TOWNSEND,

NEW REMEDIES.

FLUID EXTRACTS.

Coto Bark.—From BOLIVIA. Almost a specific in acute and chronic diarrhœa, cholera, cholera morbus, etc.

Cascara Sagrada.—(**Rhamnus Purshiana.**) From the PACIFIC SLOPE. A certain remedy for habitual constipation; and very useful in all cases where a laxative or cathartic is indicated. Beware of the fluid extracts of spurious varieties of this bark.

Folia Carobæ.—From BRAZIL. A powerful alterative, which exerts a marked curative action in syphilis, scrofula and kindred disorders.

Rhus Aromatica.—A remedy in diabetes, and other diseases of the genito-urinary organs.

Damiana.—(**Turnera Aphrodisiaca.**) From MEXICO. The best known aphrodisiac. Of great value in impotence, spermatorrhœa, and loss of sexual appetite.

Boldo.—(**Peumus Boldo.**) From CHILI. The new tonic. Very useful in dyspepsia, hepatic torpor, yellow fever, etc.

Berberis Aquifolium.—From CALIFORNIA. Has marked alterative and tonic powers, and has been used with extraordinary success in salt rheum, psoriasis, eczema, scrofula and syphilis.

Black Haw.—(**Viburnum Prunifolium.**) From the UNITED STATES. Employed to prevent abortion and miscarriage.

Grindelia Robusta.—From CALIFORNIA. A valuable curative agent in asthma and diseases of the air passages.

Grindelia Squarrosa.—From CALIFORNIA. Anti-malarial. Used in enlarged spleen and other malarial diseases.

Cereus Bonplandii.—(**Cereus Grandiflorus and Cereus McDonaldii.**) From MEXICO. Heart sedatives. Very useful in controlling functional and organic disturbances of the heart.

Kaki.—(**Diospyros Kaki.**) From JAPAN. Peculiar action on the mucous surfaces. Useful in mucous dyspepsia, typhoid fever, etc.

Cercis Canadensis.—Indigenous. A positive remedy in chronic diarrhœa, dysentery, etc.

Jaborandi (diaphoretic). **Guarana** (sick headache). **Fucus Vesiculosus** (anti-fat).
Bearsfoot (enlarged spleen). **Coca** (nervous stimulant). **Kava Kava** (Gonorrhœa).
Eucalyptus Globulus (antiseptic and anti-malarial). **Yerba Santa** (coughs).
Yerba Reuma (catarrh). **Wood Betony** (dyspepsia). **Ustilago Maidis** (oxytocic).
Penthorum Sedoides (catarrh). **Soap Tree Bark** (tooth wash).

CRUDE DRUGS.

Goa Powder (ringworm and diseases of the skin). **Gurjun Balsam** (a substitute for Copaiba).
Alstonia Constricta (a substitute for Calisaya).

SUGAR-COATED GRANULES.

Calcium Sulphide 1-10 gr. (for the cure of boils and carbuncles).

Our limited space prevents our describing in detail the history and application of each remedy, but to those interested in NEW REMEDIES, we will say, that we can furnish interesting information relative to the above new drugs.

PARKE, DAVIS & CO.,

DETROIT, - MICHIGAN.

Our New Remedies can be procured of the Drug Trade throughout the United States. By specifying **"P., D. & Co.'s"** in all cases, you will ensure reliable preparations of the **true drugs.**

HINTS IN THE OBSTETRIC PROCEDURE.

BY

WILLIAM B. ATKINSON, A.M., M.D.,

Lecturer on Diseases of Children, at the Jefferson Medical College; Physician to the Department of Obstetrics and Diseases of Women, Howard Hospital, Philad'a.

SECOND EDITION. ENTIRELY RE-WRITTEN AND ENLARGED. 12MO, CLOTH. PRICE, $1.00.

—o—

The very gratifying reception given this handbook of the essentials of the obstetrical art has led the author to submit it to a careful revision, and increase its size by adding a number of new topics.

It may safely be characterized as the most convenient, compact, reliable and handy *vade mecum* on obstetrics in the language; as the following personal and editorial statements sufficiently attest.

OPINIONS OF PHYSICIANS AND THE PRESS.

"It is really a '*multum in parvo*,' and will, I am sure, be of great service to multitudes in the profession who have hitherto followed the routine of old traditions."—*Prof. Fordyce Barker.*

"It is as good for the old as for the young practitioner."—*Dr. J. Marion Sims.*

"It abounds in extremely valuable hints, and is calculated to do much good."—*Prof. Goodell.*

"Founded upon the personal experience of the author, it must prove of value to the very wide circle of the profession who will be led to purchase it by their acquaintance with the author and his reputation."—(Philadelphia) *Medical Times.*

For Sale by D. G. BRINTON,

115 SOUTH SEVENTH STREET, PHILA.

JOHN C. BAKER & CO.'S

WITH

EXTRACT of MALT,

A combination we have lately added to our list, in response to a demand from physicians of this city, who have used our **Pure Cod Liver Oil** and other preparations. The praise accorded by all who have used it induces us to seek a wider market by calling general attention to it.

A Trial is Respectfully Solicited.

Our facilities for the manufacture of

THE EXTRACT OF MALT

are unsurpassed, and perfect reliance may be placed on the article bearing our label.

Above are in full pint bottles, and with our other specialties:—

Baker's Pure Cod Liver Oil,
" " *C. L. O., with Phosphate of Lime,*
" " " " *and Wild Cherry,*
" " " *Hypophosphites of Lime and Soda,*
" " *and Malt with Syr. Iod. Iron,*

Are supplied by the drug trade generally.

An astringent and balsam combined, in most convenient form for application. Rapidly becoming popular with physicians. Descriptive circular and endorsements mailed on request. Boxes of 14 suppositories to physicians, 75 cts., by mail.

JOHN C. BAKER & CO.,

1180-eowtf **PHILADELPHIA.**

W. H. SCHIEFFELIN & CO.'S

SOLUBLE

Pills and Granules.

UNEQUALED FOR

Purity in Composition, Solubility in Coating, Uniformity in Size, Perfection in Form and Finish.

1. The best materials are used in their manufacture.
2. No article required by a formula is omitted on account of its high cost.
3. No Pills are deficient in weight.
4. The Pills are Coated while soft.
5. There is but one Coating, which is perfectly soluble, and there is no sub-coating of resinous character.
6. The Coating is so transparent as to clearly reveal the color of the mass, and its solubility is not impaired by age.

Our list of Pills and Granules embraces those made according to the formulæ of the U. S. Pharmacopœia; also most of those in common use among the profession.

Trade supplied in Philadelphia by

1164-1215eow **ROBERT SHOEMAKER & CO.**

R. & J. BECK,

MANUFACTURING OPTICIANS,

1016 CHESTNUT STREET,

PHILADELPHIA,

Beg to call the attention of physicians and students to the following novelties recently introduced by them:—

Beck's New National Microscope, Monocular,	$ 75.00
Beck's New National Microscope, Binocular,	100.00
Beck's Economic Microscope, Monocular, -	35.00
Beck's Improved Economic Microscope, Monocular,	50.00
Beck's Improved Economic Microscope, Binocular,	80.00
Beck's New Histological and Dissecting Microscope,	25.00
Beck's New Model Dissecting Microscope, -	15.00
Beck's New Volute Turn Table, self-centering for all slides, - - - - - - - - -	7.00
Mr. Walmsley's New Freezing Microtome, complete, with Atomizer, - - - - - -	20.00
Beck's New Clinical Thermometers, with indestructible index and ineffaceable scale.	
Dr. Seiler's Section Knife and Carrier, - -	12.00
Dr. Woodward's Diatom Prism, mounted, -	1.50

The above instruments, together with every article used by the microscopist, will be found fully illustrated and described in our catalogue of 144 pages; mailed free to any address.

A CASE OF SEVERE INJURY OF THE BRAIN—DEATH AFTER ELEVEN WEEKS.

BY A. ROBERTSON SMALL, M.D.,

Of Decatur, Ill.

About 7 P.M., March 3d, 1879, was called in haste to see Clyde Bell, a boy about three years of age, who, while playing with some children a few minutes before, with some sharp sticks of pine, had accidentally run or fallen against one in such a manner as to penetrate the left orbit. Arriving at the house about five minutes after the accident occurred, I found a stick projecting from the left orbit about a quarter of an inch. The child was in a comatose condition, with stertorous breathing, hands and feet cold, and pulse barely perceptible. Having with me only a very light pair of forceps, I found it impossible to remove the stick with them, so firmly was it imbedded. I sent a messenger to Drs. W. J. and C. Chenowith, requesting them to come immediately, and bring with them a strong pair of forceps. They arrived in a few moments and attended the case with me throughout. Dr. W. J. Chenowith applied a strong pair of forceps to the projecting end of the stick, and with considerable force removed it. The stick was a pointed piece of pine, about a quarter of an inch thick and five and a quarter inches in length, only about a quarter of an inch of which was projecting. It had entered the left orbit just between the eye and the nose, puncturing the inner portion of the upper lid, pierced the orbital plate of the frontal bone, and taken a direction toward a point about two inches above the right ear; consequently, at least four inches of it must have been imbedded in the anterior and superior lobes of the brain. On removing the stick a small portion of brain followed, and but very little blood. We placed the child in a favorable position for drainage of the wound, and applied hot applications to extremities. None of us thought the child could live through the night; at most, a few days.

9 P.M. Pulse more full; extremities warmer; has vomited two or three times, and occasionally is partially aroused and cries, when it is allowed to inhale sufficient chloroform to quiet it.

12 P.M. Pulse 110 and full; extremities warm. The child called "Papa," and put its hand to its head, as if in pain. Gave a hypodermic injection of morphia sulphate, grains $\frac{1}{60}$. From this time to about 2 A.M. the child would partially arouse about every fifteen minutes, cry with pain, and twice asked for a drink of water, which was given it, and then remain quiet again.

2 A.M. Pulse 110; breathing almost natural; skin hot and dry. Gave morphia, gr. $\frac{1}{30}$, by hypodermic injection.

4 A.M. Has been resting well since last injection, but is becoming a little restless now; condition otherwise about the same; repeated the injection of morphia, gr. $\frac{1}{30}$.

8 A.M. Roused up and asked for milk, which was given it, and then asked to get up. Don't seem to be suffering any pain. There is hemiplegia of the left side. In case it should become restless, ordered it given morphia, gr. $\frac{1}{30}$.

12 M. Has been resting quietly, though has had no morphia since 4 A.M.

4 P.M. Has been conscious at times, since noon, and asks for what it wants. Has taken

some beef tea, but no medicine of any kind since 4 A.M., as he seems to rest well without it. Pulse 100. Breathing rather heavy, but regular.

8 P.M. No perceptible change.

12 P.M. Pulse intermittent, weak and thready. Gave an enema, by which the bowels were moved.

March 5th. Pulse 82, weak, thready and irregular. Respirations 24. He is conscious, and asks for what he wants. Passes water regularly. Applied a poultice over the wound, to favor discharge.

1 P.M. Condition about the same as in the morning. We are giving just morphia enough to keep the child quieted.

6 P.M. Condition unchanged.

6th. 9 A.M. Has partially recovered the use of the left side. Pulse 80, weak and intermittent. Respirations 24, and nearly natural. Has rested well through the night. Very little discharge from the wound.

3 P.M. Pulse 100 and more regular. Temperature normal. Wound discharging pus. The child is perfectly conscious and rational, and was awake about two hours this afternoon, looking around the room, recognizing its friends, and resting quietly. Bowels and kidneys are acting naturally.

7th. 4 A.M. Pulse 90. Respiration 24. Child fretful and uneasy. Skin hot, but moist.

9 A.M. Very fretful and uneasy; cries if strangers come near. Surface hyperæsthetic and itchy. Wound discharging pus in a moderate amount. Skin moist. Slight incoördination of the muscles of the right side. Ordered sponge bath, to relieve the itchiness, which had the desired effect.

5 P.M. Pulse 98 and regular. Respiration normal. Hyperæsthesia has disappeared. Bowels have been moved by enema. Has been resting quietly since 10 A.M. Has full use of left side. Is perfectly rational and inclined to play.

8th, 10 A.M. Pulse 90 and regular. Respirations normal. There now is paresis of left side. The power of coördination has returned to right side. Slept well and naturally through the night. Has complained of pain in the head once this morning. Is inclined to play, and is hungry. We only allow it fluid nourishment, and that in small quantities at a time.

6 P.M. Pulse 90 and intermittent. Has rested well through the day, though has had no morphia since 3 A.M. Is perfectly rational and is inclined to play. Wished to stand on the floor to-day, which it was allowed to do. It was able to take two or three steps, being supported.

9th. 10 A.M. Pulse 80 and intermittent. General condition better. Ordered dose of castor oil, to thoroughly unload the bowels, as they have only been moved by enema heretofore.

4 P.M. Pulse 90 and more regular. Has rested well through the day, except once or twice, when it complained of pain in the head. Has had no morphia or anything to quiet it since 5 A.M. Bowels have been moved freely by the oil given this A.M.

10th. 9 A.M. Pulse 110 and regular; rested and slept well through the night. Is very hungry; only allow it light food in small quantities. Is inclined to talk a good deal this morning, and is perfectly rational, as, indeed, it has been from the first. The explanation we give for the pulse varying from 80 to 110 is, that when it is beating 80 or near that, per minute, it is intermittent, and misses every fourth or fifth beat, whereas, when it is 100 or over, it is not intermittent, and loses no beats; so that the variation of the pulse relates more to the intermission than the rapidity. Paresis of the left side still continues.

5 P.M. Pulse 82 and again intermittent. No change perceptible since morning.

11th. 10 A.M. Bowels were moved last night with oil. Is having better use of left side. The child is bright and playful, and rested well through the night.

5 P.M. Pulse 80 and intermittent. Improvement in general condition. More inclined to talk and play to-day than since it has been hurt.

12th. 1 P.M. Pulse 110 and regular. Skin moist. Has been more restless and fretful to-day than usual. Bowels moved by a dose of oil given this morning.

13th. 2 P.M. Pulse 110 and regular. The œdema has entirely disappeared from the eyelid. Wound discharging slightly. Fretful at times.

14th. 1 P.M. Pulse 100 and regular. Is able to partially open the left eye. Paresis of the left side decreasing. Has had no morphine for three days, still, is not suffering, though fretful and uneasy at times.

15th. 2 P.M. Pulse regular and normal. General condition seems very much improved. Wound discharging only very slightly. Has still slight paresis of left side. Is able to open left eye, which moves with the right, and it seems to have full use of it.

16th. 4 P.M. Pulse 80 and irregular. More inclined to talk and play than has been. No discharge from the wound to-day,

17th. 1 P.M. Pulse 80 and very irregular. He is fretful and uneasy; complains of something hurting him, though does not localize the pain;

seems to have a general feeling of uneasiness. Some hyperæsthesia of left side. Ordered a full dose of castor oil, and a sponge bath. A small dose of morphia was given it at 11 A.M. to-day, which is the first it has had since the 11th.

19th. 2 P.M. Pulse 76 and intermittent. Wound entirely healed. Child very fretful and complains of pain in the head. Vomited once this morning, and seems to be suffering from indigestion. Ordered elix. rhei et magnes., ʒj, to be repeated in four or five hours, if necessary, and to use an enema.

20th. 1 P.M. Pulse 100 and natural. Bowels were freely opened with the elix. rhei et magnesia, and since then has felt much better. To-day he is bright and playful, and is much better in every respect than has been since the accident. The paretic condition of left side is growing less every day. He is gaining strength, and is now able to sit up alone.

23d. 10 A.M. General condition very much improved. Child is still fretful and its bowels are inclined to constipation. Has had some nausea and indigestion, for which prescribed bismuth sub. nit., in one-grain doses.

24th. 10 A.M. Child slept better last night than usual. Pulse about normal. Prescribed

℞. Elix. pepsin, bismuth and strychnia ʒ vj
Elix. simp., ʒ xxvj. M

SIG.—A teaspoonful morning and evening.

27th. 4 P.M. Patient very fretful. Slight strabismus of left eye. The great toe of left foot extended, while the remaining toes of same foot are flexed. Bowels constipated. For the last two days, as the weather has been pleasant, the child has been out of doors a good deal, in his buggy. As the nervous irritability is so great to-day, we will discontinue the elix. pepsin, bismuth and strychnia. Ordered for the constipation, hydrarg. cum cret., gr.vj; and after the bowels are opened, the following, as a laxative:—

℞. Fl. ext. cascaræ sagradæ, ʒ ijss
Elix. simplicis, ad ʒ ij. M.

SIG.—Fifteen drops four times a day.

And to relieve nervous irritability—

℞. Tr. opii, deod., gtt. v.

Every four to six hours, as needed.

29th, 11 A.M. Flexor muscles of left leg contracted, and the leg flexed on the thigh. The great toe extended and the others flexed. As the bowels are still constipated, ordered the medicine prescribed on the 27th to be given every four hours. The hyd. cum cret. given on the 27th acted freely.

30th, 9 A.M. The father called this morning, and stated that the child vomited every time it took the medicine, and that its bowels had not yet been moved by it. Gave some bismuth powders, to be taken a short time before the cascara, to quiet the stomach, and ordered the dose of the cascara to be doubled.

31st, 3 P.M. General condition better than for several days, though there is still a good deal of nervous irritability. Bowels moved this morning freely, and has had no vomiting since yesterday. Continued same treatment.

April 3d, 11 A.M. Has complained of pain in left foot and hand. There is still some contraction of the muscles of the toes of the left foot, though not so marked as before, and the toes are now easily straightened by slight pressure. As the cascara sagrada makes him sick every time he takes it we have discontinued it, and ordered the following:—

℞. Fl. ext. hyoscyami, ʒ j
Elix. simp., ad ʒ iv. M.

SIG.—A teaspoonful three times a day.

The above is given for the purpose of acting on the bowels, as well as for its sedative effect.

7th, 3 P.M. Has not been so fretful since last visit. Muscles of the toes of left foot are now entirely relaxed and natural. Has been playful and cheerful. Bowels moved naturally on the 5th, but since then they have not. Ordered an enema, and the dose of hyoscyamus increased one-half.

15th. Pulse 88, and somewhat irregular. Bowels still inclined to constipation, and are kept open by enema and castor oil, with an occasional dose of hyd. cum. cret. Paretic condition improved slightly. There is a slight tendency to contraction of the flexors of left leg. He is gaining in strength, and is now able to sit up, but not to walk.

24th. Has been to the country for several days, and comes back very much improved. Is more cheerful, appetite, digestion and color improved, and bowels acting more regularly and naturally. There is a lack of coördination of the muscles of the left side, and at times a tonic contraction of the flexors of the left leg and toes, except the great toe, which is extended, but when taken hold of they yield readily to pressure, though at times are slightly rigid.

May 20th. Child has been steadily gaining since last report. Bowels and kidneys are now acting naturally, and the child is gaining in weight. Paretic condition and lack of coördination of left side so far improved, that for the past few days he has been able to stand alone and take a few steps by holding to a chair. About 3

P.M. his mother left him asleep, in care of other children, and went out; returning an hour later, she found him crying very hard and very much excited. He then had one or two mild spasms, and was entirely unconscious after the first. Dr. Chenowith and myself were hastily summoned, and arriving about 5.30, found the child in a comatose condition, with stertorous breathing, with every symptom of pressure on the brain. Had one or two mild spasms soon after we arrived. We endeavored to get his bowels to move by enema, and as he could not swallow, rubbed croton oil over the abdomen, but did not succeed in getting them to move. Was perfectly unconscious and comatose after the first spasm, and died at 8.30 P.M. Post-mortem refused. We learned that he had eaten some green gooseberries given him by children the day before his death, and that he was subject to spasms before the injury, after eating indigestible material. We also learned that he had fallen out of his buggy the morning of his death, while in care of children. The spasms might have been caused by indigestion, and the spasm might have caused a rupture of a vessel in the cicatrice of the wound in the brain, and thereby produced compression; or the excessive crying and excitement just before the spasm might have had the same effect. Or, possibly, the fall from his buggy might have contributed something toward the result. The case is of interest as showing the amount of injury that may be done the brain without affecting the intellect. There was no disturbance of his mental faculties after the third day from the injury, except some irritability. We were surprised, at first, that he could live with so severe an injury, but after living eleven weeks, with a steady improvement, we were not looking for him to die so suddenly. We regret that we were unable to obtain a post-mortem examination, as it might have thrown some light on cerebral localization, by determining the portion of the brain injured.

Internal Use of Tar.

Prof. Reclam, of Leipzig, in a number of the Berlin *Klin. Wochenschrift*, July, reports some therapeutic experiments with tar. He used it in pills or capsules, and says that tar water is not so efficient. One curious and constant effect noted was that the urine of a patient taking tar does not decompose for five or six days, instead of in twenty-four hours, as usual. The general indication for tar, he says, is a chronic catarrhal inflammation of the mucous passages of the respiratory or urinary tract, as bronchitis, vesical catarrh, gleet, etc.

Hospital Reports.

PENNSYLVANIA HOSPITAL.

November 15th, 1879.

REMARKS UPON TWO CASES OF CEREBRAL APOPLEXY—ONE WITH APHASIA—CONTRASTED WITH ALCOHOLIC DEMENTIA,

BY PROF. DACOSTA.

REPORTED BY DR. FRANK WOODBURY.

Case 1.—Effusion into Right Hemisphere, with Left-sided Hemiplegia.

Gentlemen:—At the conclusion of the hour, at my last clinic, we were engaged in discussing the pathology of a case of recent fatal apoplexy, the condition being well illustrated by the specimen we had before us. You recall the fact that the case came into the hospital on the day of his attack, and survived four days. He was sixty-six years of age, and had been previously healthy. It was reported that he had exhibited complete left-sided paralysis when first seized, but after admission, when he had become conscious, so that he made correct replies to some questions put to him, it was found that the leg could be moved, but the left arm remained completely powerless. You recall the appearance of the clot, how it affected alike the corpus striatum and part of the optic thalamus, breaking down the internal capsule; in other words, lacerating the great motor tract, as well as part of the parietal convolutions. You also remember that we had begun the consideration of the clinical effects produced by this central lesion; we will therefore resume the discussion at this point.

The one effect of the effusion which struck us particularly during life, was the dissimilar degree of palsy in the arm and the leg, one being so much more affected than the other; suggesting, at first, that the lesion was not situated in the corpus striatum, but in one of the special cortical centres in the great motor area of the brain. But does this follow? Given a case of suddenly developed hemiplegia, more marked in the arm than in the leg, or principally in the lower extremity, does it indicate that the lesion is in a cortical area, or, at least, not in the corpus striatum? To this I would answer that, notwithstanding the ingenious, and for the most part correct, conclusions from physiological studies upon the localization of function, which have established the truth of the observation that a certain portion of the surface of the brain presides over the movements of a particular part of the body, still, clinically speaking, we are obliged to admit that we are unable to say, when in hemiplegia the paralysis is much more marked in one member than in another, that the lesion is not a central one—that is to say, one involving the motor ganglia—but purely cortical. This was evident in the case under discussion; which illustrates the fact that central lesions of most marked character may exist, and yet show you a hemiplegia in which the arm palsy is far greater than that of the leg; although from your studies of cerebral localization you would have been prepared to believe that the effusion might be simply cortical, affect-

ing mainly the ascending frontal and ascending parietal convolutions, situated upon the opposite side of the brain from the palsy.

As regards the treatment, I will speak briefly, as you did not see the case. He was cupped, and a few leeches were applied; in other words, blood was drawn from the head, but without effect. When the heart showed signs of failing, he was given hypodermic injections of digitalis, two drops of the fluid extract diluted with water, repeated as often as was thought necessary.

In commenting upon this treatment, I must say that, as a rule, I draw blood, either locally or generally, in cases of cerebral blood effusion, and frequently with good result. But candor compels me also to state that, where the texture of the walls of the arteries is weak, and the effusion is large, very little effect can be looked for from treatment. Where there is atheroma elsewhere in the system, and signs of general decay, you will find that cases of apoplexy so associated soon die, either from exhaustion or from a fresh breakage and extravasation into the brain.

I would also call your attention to the use of digitalis hypodermically, which, if you wish to revive a flagging heart, is well worthy of your consideration. I prefer the fluid extract diluted with water, two drops of the extract being equivalent to about fifteen minims of the tincture. These injections can be repeated as often as necessity exists, or the heart failure appears to indicate.

One point in conclusion. The temperature record was very significant. When admitted he had a low temperature, which was followed, in the course of a day or two, by a decided rise, (101°) showing the existence of irritative fever. This would indicate that the clot, instead of being quietly absorbed, was exciting local irritation that, if continued, might lead to softening or further disorganization, and render the prognosis less favorable.

Case 2.—Effusion into the Left Hemisphere, with Right-sided Hemiplegia and Aphasia.

In connection with the preceding, this case will be of interest, as it shows a peculiar form of cerebral disease.

His name is Henry L., 40 years of age, of Irish birth; is a tavern-keeper, and shares the habits of many of his pursuit; for we learn, from what we are told of him, that he is of intemperate habits. During the last five years, he has been subject to peculiar attacks, in which he suddenly became unconscious, remaining so for several minutes. It is stated that there were no convulsive movements, nor was there frothing at the mouth. Thirteen days before admission, which was on Oct. 27th, 1879, while in apparently good health, he fell to the floor unconscious, remaining so for ten minutes; when he regained his senses he was unable to speak. His wife states that he was paralyzed in the right arm and leg, but that this condition soon improved. His mental condition seemed to be very dull and stupid immediately afterward.

Now, gentlemen, when he was admitted into the hospital the paralysis had disappeared to a great degree, but it was noticed that there was considerable rigidity of the muscles of the right side of the body. He moved the leg like an artificial one, bringing the heel down stiffly, with the toes elevated; when his arm was lifted up it remained extended for a considerable time, like a wooden doll, or an automaton. The grip of the right hand, however, was still impaired.

As regards sensibility, it was noted that sensibility was impaired all over the body, the right side being apparently more affected than the left. But I must ask you to take this statement with some doubt; for when you come to question the sensibility, you have to deal with the perceptions of the patient, which will be largely influenced by his mental condition. We have already seen that the state of the mind of the patient was not such as to allow us to place much reliance upon his statements as to delicate points, such as the relative sensibility of different parts, requiring nice powers of observation, but we may say, in general terms, that general tactile sensibility was apparently diminished.

All this time his articulation was confused and thickened. He has now improved in his intelligence, and takes cognizance of what goes on around him, and accompanies his attempts at speech by a series of confirmatory nods, which may not be always correctly given. He can now say "yes" quite distinctly, but he gives this reply to every question; in truth, he possesses but this one word in his vocabulary. Once in a while he makes a faint attempt to say "no," but not very clearly, and the "yes" predominates.

He presents a doubtful history of specific disease; and at all events, I do not think that it is directly connected with his present condition.

The urine is slightly acid, sp. gr. 1.010, pale, cloudy, and contains, at times, a small amount of albumen; this, however, must have been due to a temporary condition of the kidneys, as late examinations have not detected any albumen in the urine. To complete the report, we further noticed that the electro-muscular contractility was decidedly impaired on the right side; the right arm did not move as readily as the left, but still it moved. The movements of the tongue were preserved; the contact of the wire brush with the tongue produced evidences of pain and inarticulate grunts of protest, but no words.

We call such a case as this, generically, a case of aphasia. Of course, you must, for the present, accept this as meaning simply that our patient is deprived of the power of speech, while he retains the power of understanding what I say to him, and the ability to move his tongue and lips; please observe that there is no crippling of the muscles of articulation. He is in the condition of a man who says "yes" to everything. Let us now inquire into the pathological cause of his trouble. You have heard the clinical history of the case up to this morning; we will now examine him further. Let us take up the question whether he understands what we say to him, to see whether it is a case of idiocy, or one in which the so-called speech centre is principally the seat of disease. Showing him a watch, and asking him if he knows what it is, he signifies, with some gleam of intelligence in his eye, that he does recognize it, but he cannot say "watch." If I ask him "is it a watch?" he promptly says yes,

with several affirmative nods. When I ask him "is it a penknife?" he responds more slowly, with a dubious or negative "yes;" on pushing the question, he mumbles what will pass for "no."

As regards his intelligence, you see that it is preserved; it is not from want of intelligence that he does not answer. From a number of observations in the ward, which we have not the time to repeat this morning, we have ascertained that, although his mental grasp of ideas is not keen and active, yet he fully and intelligently comprehends our questions, and will perform complicated movements, like taking off his coat, or putting his handkerchief in his pocket, when requested to do so. It is evident, therefore, that it is not from idiocy that there is deficient power of articulate expression. We have also tried the effects of the battery in arousing him, as it was thought that the man might be in a condition of dementia from chronic alcoholism; further, this form is soon associated with general loss of power in the muscles, is known as "paralytic dementia from alcoholism," and is accompanied by mental dullness, and defects of articulation, rather than aphasia. We have solved the point here by the use of the electric brush, which caused great pain, and free movement of the tongue. To this procedure he strongly objected, but was unable to complain. This electric brush, with a strong current, is also one of the best means of detecting malingering, as it causes severe pain, and involuntary expressions of suffering are forced from the patient. In the present case, although the perception of pain was evident, yet not a word escaped him beyond the inevitable "yes."

We have now established the fact that this is a case in which there is a loss of words, or aphasia; let us now go into the probable cause of the aphasia, to discover its source, or the lesion with which it is connected, and then see what it really indicates. I have already told you that there is a doubtful history of syphilis, but it is so doubtful that we have declined to accept it as evidence. There is no history of malarial poisoning, and no history of disease of the heart; this I will proceed to verify by examination. I can find no murmur; there is neither dilatation nor hypertrophy. An inquiry into the state of the kidneys shows that while, occasionally, there is a small amount of albumen, yet it is inconstant. I will report further that the eyes have been examined, and the evidence is negative, at least, we have found no distinct alteration. The ophthalmoscopic examination was made all the easier from the fact that the pupils are constantly dilated.

Having said that this was a case of aphasia, let us test his power to write words. We find that this is absent also, but not from crippling of the arm or hand, as he attempts to write when directed to do so, but only forms an unmeaning scrawl. Here is an additional evidence of the intelligence which he possesses, since he makes the effort to write. We have here, then, a loss of written language as well as of articulate speech; or, if you choose to use the technical terms, of agraphia, associated with aphasia. I will now test him still further, to see whether it is only the power of utterance that fails him, or has he also lost memory of words. I ask him to say "clinic" and "room," but he cannot say them, even after I repeat them. Further, he refuses to signify assent to a wrong word applied to an object. This agrees with the other tests which we have previously made, where we saw that the appreciation of words was not lost; he refused to recognize a "watch" under the name of "penknife." As he is now getting a little fatigued, we must take the result of his previous examinations, which is, that the memory of words may be partially lost, but it is not lost altogether.

Now, this establishes a number of facts about this case, of great interest. We make it out to be a case of aphasia and agraphia, with right-sided loss of power. The variety of aphasia where memory of words is lost is called, technically, *amnesia*, or amnesitic aphasia; where memory is not impaired, we have what writers simply call *aphemia*, or ataxic aphasia; in the latter the power of writing words is generally preserved. I care very little for your remembering these terms, but would simply ask you to note that the memory of words can be impaired, that the power of articulation may be lost, and the ability to write entirely fail, in a single patient, or these symptoms may occur separately in individual cases.

What underlies this condition? What is the lesion, and where is the lesion? I suppose that any one of you could tell me off-hand, from your physiological studies, that the special centre for speech is located in the left frontal convolutions, and especially in the inferior convolution, which, in honor of its discoverer, has been called Broca's region, for to the labors of Professor Broca are we indebted for the most of our knowledge upon this subject. This area especially presides over articulate language, and as the rule, we may say, given a lesion here, and we have resulting loss of speech. We, therefore, locate the injury, in the present case, in, or in the neighborhood of, the left inferior frontal convolution.

Now we come to another question: with what is the aphasia here connected? What is the exact lesion in this part of the brain which has given rise to the aphasic condition? About this we cannot be quite so certain as about the site of the lesion. Any destructive lesion whatever would give the same symptom. But I do not think that it is beyond the power of diagnosis to establish the exact cause of the lesion. Look at it. The attack came on suddenly, following spells of disturbed sensibility for several years. Notwithstanding this history, the attack was a sudden one. What are the causes of sudden attacks of hemiplegia? (1.) An extravasation of blood from rupture of a blood vessel, *an apoplectic effusion;* (2.) A plug washed into the brain in the arteries, *an embolism;* (3.) A sudden local clottting in vessels of the brain, without being carried there by the current, *a thrombosis.*

Now, gentlemen, the latter supposition I dismiss, because it is extremely rare, and because when it happens it is associated at the time with a very different clinical history. We must, therefore, look to the other two conditions which remain for us to discuss, to explain the cause of

the malady. If you ask which of these two I think it is, I reply, an apoplectic clot, coming from a rupture of degenerate vessels; a very small clot, limited to the region of the speech centre, by no means as large as in the preceding case. I take this view because we had here a case of sudden marked unconsciousness, with evanescent right-sided hemiplegia, accompanying the aphasia; and because I have no signs of disease of the heart which would favor the idea of embolism; the sudden attack, without cardiac disease, would incline me to the idea of apoplectic effusion rather than embolism.

But is this all? No. A clot may be followed by local softening, and such is probably the condition here. If, as we believe, the clot has now been largely absorbed, we would not have had this persistent impairment of intelligence and loss of speech, had not some such change occurred.

Therefore, to sum up the diagnosis, the case is one of lesion in the left inferior frontal convolution (Broca's speech centre), and the ascending convolution in front of the fissure of Roland (Hitzig & Ferrier's motor centre for the arm), caused by a clot, with subsequent softening.

There only remains one point for consideration, the right-sided hemiplegia. You will ask me, "Is right-sided disturbance common in these cases of aphasia; in cases where a lesion exists in the left frontal convolutions, in Broca's region?" I answer, "Yes, most usual; the exceptions are very few." There is, finally, in this patient a peculiarity about the loss of power to which I must call your attention. He had, at first, complete hemiplegia, which then nearly disappeared, though not entirely, for the grasp is not entirely recovered. It has been followed by a certain amount of spastic contraction, or rigidity of the muscles. The forearm and arm are moved mechanically, like an articulated doll; the same is seen in the leg, but to a less extent. This is now less distinct than when examined in the ward; the arm was then held almost indefinitely, like a cataleptic, in the position in which it was placed, or like an automaton, or painter's model. I mention this because it is a little different from ordinary hemiplegia, and indicates an irritative lesion in the brain. When you have marked rigidity coming on after paralysis caused by clot, as Todd long ago taught us, it is apt to indicate a progressive irritative lesion in the brain or nervous centre.

The possible influence of chronic alcoholism in bringing on a degenerated condition of the vessels of the brain is familiar to you all; but to show you that this is not a case of alcoholic dementia, I will read you the notes of another case in the wards, which was before you on a previous occasion.

Dementia following Alcoholism.

James R., forty-eight years of age, who had been a drinking man for many years, often to excess, was admitted into the wards October 10th, 1879. He has had several attacks of delirium tremens, but continued his intemperate habits. Eighteen months before admission he commenced to suffer with pains in the head and along his spine, which sometimes were intense. He has lost flesh and strength, until he had become almost helpless. It was reported that for four weeks before admission he had been quite demented and gradually lost his power of speech and of hearing. When stood upon his feet he would stagger backward and fall, if not supported. He never had been subject to epileptic attacks.

When we examined him we found that he gave only unintelligible replies to questions, and seemed to be insane; his eyes were staring, but pupils were not dilated. He often muttered incoherently, and sometimes had active delirium, requiring him to be strapped in bed. He was very noisy at night, shouting and singing. He ate his food, and did not vomit. Tongue heavily coated, but not dry, epithelial coat yellowish. Bowels constipated, requiring enemata. The urine was passed in bed; obtaining a little for examination, it was found to obtain an excess of phosphates, but no albumen nor sugar.

Not to detain you with this case, in which the heart and other organs of the body were reported to be normal, and the electro-muscular contractility good, I would merely report that, under the use of bromide and iodide of potassium, with good food, he has improved very greatly, so that he appears quiet and almost rational during the day, but is still very noisy and restless at night. I have merely stopped to read you these notes in order to point out the chief symptoms present in a case of alcoholic dementia, in order to contrast it with the case of aphasia before us.

The questions of prognosis and treatment in the patient with aphasia remain to be considered.

The prognosis is not good. If our diagnosis be correct, as I think it is, that there is a clot with subsequent softening in the left anterior lobe, the clot will be absorbed, but the softening will remain—we cannot hope for much. Although I have occasionally seen cases recover, and eventually regain their speech, I fear this will not be the case here. The prognosis, then, is not favorable, certainly not for a complete recovery.

In reference to the treatment, as we think that there exists consecutive softening, we can only hope for good results from remedies that improve the general nutrition. With this view he has been taking, for some time, cod-liver oil and iron preparations, with a good diet. Undoubtedly this will improve the nutrition, and perhaps some advantage may be accomplished. With the view of its special action upon the nutrition of the nervous system, I will now order him the hypophosphites of lime, iron, soda and potassa, in the form of the compound syrup of the hypophosphites, two drachms of which shall be given three times a day. The cod-liver oil is to be continued in doses of half an ounce after meals, in order to improve the general nutrition. We will also use the Faradic current to the paralyzed muscles, and also to the tongue. You may inquire why we should stimulate the muscles of the tongue, since it is not there where the difficulty originates, but I hope that by exciting the peripheral extremities of the nerves we may increase the activity of the nerve-centres. It has been recommended to attempt the same thing by applying the galvanic electrodes di-

rectly to the skull, over the motor centres, but thus far without any marked success.

Gentlemen, I have presented these two cases of apoplexy with hemiplegia in order to impress upon you the pathology of cerebral effusion; and have contrasted the symptoms presented by the patient with aphasia with those of true alcoholic dementia, as exhibited by a third patient, whom you saw at a former clinic, so as to place in your possession the chief points of differential diagnosis. If these characters have been made clear to you, the hour will have been spent to a good purpose.

Medical Societies.

PROCEEDINGS OF THE MEDICAL SOCIETY OF HARFORD CO., MD.

Reported for the Medical and Surgical Reporter.

Pursuant to adjournment, the regular meeting of the Harford County Medical Society was held at the Masonic Hall, Havre de Grace, on Tuesday, November 11th, 1879.

The President, Dr. John H. Cochran, the Vice President, Dr. Wm. P. Taylor, the Treasurer, Dr. R. D. Lee, the Secretary, Dr. W. Stump Forwood, and a respectable number of members, were present. There were also present, as visitors, Dr. Alex. Craig, of Columbia, Pa., and Dr. Ed. P. Dallam, of Harford County.

After concluding the usual routine business, Dr. R. D. Lee, the lecturer for the day, proceeded to deliver his remarks upon the subject of "Venereal Diseases." The substance of the lecture, as stated by the Doctor, was based chiefly upon notes taken by an American student of his acquaintance, from the clinical lectures of the great venereal surgeon, Ricord, of Paris.

The transmissibility of the lues venerea from parent to offspring, through several generations, presenting itself often in remote generations, under forms of different names, such as scrofula, phthisis, dropsy, cutaneous diseases, epilepsy, mania, blindness, deafness, paralysis, etc., etc., was largely dwelt upon by the lecturer. One generation, he asserted, may apparently entirely escape the poison in any recognizable form, while the next will present unmistakable evidences of the hereditary taint.

The two forms of syphilis, the hard or Hunterian chancre, and the soft and comparatively innocuous chancre, were generally recognized and accepted by the best authorities of the present day.

As regards the treatment, but little diversity of opinion exists; the long continued use of one of the mercurial preparations—some practitioners preferring one and some another—and the iodide of potassium, were the recognized remedies; the mercurials in the early stages, and the potassium in the secondary and tertiary forms.

In respect to the Hunterian chancre, from which so many of the evils which afflict mankind flow, and the consequences of which are so much to be dreaded, the long-continued mercurial treatment is the only remedy on which any reliance can be placed for a permanent cure—if it be possible ever to cure this dreadful malady. The treatment must be continued, said the lecturer, long after every vestige of the disease has disappeared.

Dr. Lee's lecture, which was replete with interest and practical suggestions, was accepted by the members of the Society present as being a very clear and able presentation of the subject, as well as a good expression of the modern thought, as entertained by the best authorities of the day.

At the request of the President, several of the gentlemen present gave some expression to their views upon the subject of the lecture.

Dr. Virdin quoted Dr. Christopher Johnston, of Baltimore, as authority for the theory of the general, nay, the universal contamination of the human family with the syphilitic poison, in some or other of its manifold forms or degrees. Dr. Johnston holds, as stated by Dr. Virdin, that syphilis, in its primary form, does not now prevail to nearly the same extent that it did twenty or more years ago; and the reason he assigns for the comparative rarity of, or immunity from, the disease in this form, is that mankind has become thoroughly inoculated. In other words, Dr. Johnston contends that the human family has become syphilized by inheritance, and hence enjoy comparative immunity from the disease in its primary form.

This is a startling and fearful doctrine.

Dr. Virdin further stated that, on the other hand, Dr. Keys, of New York, who was, perhaps, quite as good authority upon this subject as Dr. Johnston, contended that syphilis could be cured by perseverance in a long course—two or three years—of mercurial treatment, and by the use of the iodide of potassium.

Dr. Virdin asserted that the old theory with regard to the injurious and debilitating effects of mercury upon the human system was not founded in fact. His own experience, as well as that of many other observers, had shown that the daily and long-continued use of mercury, as prescribed in syphilitic diseases, was not incompatible with the healthy nutrition of the system. He had treated such patients—has one in charge at the present time—who have gained in weight, to the extent of several pounds, after the regular daily use of mercury for several months.

Dr. Silver expressed surprise and indignation at the theory of Dr. Johnston, who contends that syphilis is never cured. He said that it appeared to him that some physicians, in striving after notoriety, were willing to announce startling theories that they really had no faith in themselves. They simply took a sort of pride and pleasure in making statements to astonish the world. He had no personal reference to Dr. Johnston, for he was not sufficiently acquainted with him to make any application of his remark. Dr. Silver continued, that he could not accept nor entertain for a moment any such idea. He stated that he had been connected with the medical profession nearly forty years, and that he could recall cases of syphilis which he had treated early in his career, in individuals who were still alive to testify that syphilis was a curable disease; that no sign of its return, or of its continued existence, had ever been manifested in their cases. He could not accept any such

doctrine; it was as abhorent to his feelings as it was improbable in fact.

Dr. W. W. Hopkins, and also Dr. Wm. J. Evans, made some remarks concerning the curability of the "disorder" in question, and both inclined to the view taken by Dr. Silver, viz:—that syphilis could be cured.

Dr. Smith said that it had been his privilege to listen to Dr. Johnston's lectures while a student, and he believed that Dr. Virdin had quoted his views upon syphilis quite correctly.

Dr. Taylor was satisfied in his own mind that syphilis was a curable disease, and quoted some illustrative cases.

Dr. Whiteford, without fully concurring in the general contamination theory or doctrine, was still inclined to the belief that such a condition, through repeated poisonings, might become permanently hereditary, as repeated vaccinations gave protection against smallpox.

The President then requested Dr. Craig, a visiting friend from Columbia, Pa., to state his views upon the subject before the Society. Dr. Craig said that he experienced some diffidence in assuming to enlighten the Society; that he was present for the sole purpose of drinking at the fountain whose waters of wisdom was supplied by others, and not with the expectation of being called upon for the contribution of any part himself. He would say, however, that many of the leading workers in the medical profession, at the present day, were leaning to the general-contamination theory. He had treated a great many cases of syphilis, and was convinced that the cases of Hunterian chancre required a very lengthy course of treatment, much longer than was formerly thought to be necessary, for the eradication of the disease. He was in the habit of using one of the iodides of mercury in the disease. Large doses of the iodide of potassium were usually very effectual in the secondary and tertiary stages; but, in his experience, he rarely found patients with stomachs sufficiently strong to bear doses large enough to accomplish the result. With the increase of his years, and the increase of his observations, he was daily becoming more and more convinced that the results of syphilis were far-reaching, and were being more generally manifested in some or other of its multiform characters, and he felt satisfied that many of the diseases met with in daily practice, and known to the profession and to the public as scrofulous, or scrofula, were simply so called as a polite name, in society, for syphilis. He had no doubt upon this point, and every practitioner could recall cases of the kind.

Dr. Craig cited a case, the facts of which were well established, in which a patient had been apparently cured of primary syphilis, at the age of thirty-five years. The disease remained dormant, without affording the slightest manifestation of its existence until the individual reached the age of seventy-two, when unmistakable tertiary syphilis became thoroughly developed.

In this case, as in the others, had the patient died before the invasion or development of the tertiary symptoms, or before he had reached the age of seventy-two, leaving children begotten subsequently to the primary affection, they would undoubtedly have inherited the disease in some form, known as scrofula, phthisis, or other constitutional disease, the origin of which, in that case, would have remained forever in obscurity. This example may be accepted as an illustration of thousands of others in which the sources of disease cannot be traced.

At the conclusion of the remarks upon Dr. Lee's lecture on "Veneral Diseases," Dr. Lee expressed himself as being highly gratified with the range of the discussion which his paper had brought forth. He also stated that he had been instructed by the various suggestions presented, and felt more than repaid for the time and labor expended in the preparation of his paper.

Dr. D. Preston Wysong next presented the following interesting clinical history of a surgical case which occurred in his practice in August last: he said, "I have to present to your attention a brief history of the case of Charles Cain, the young man who was badly cut up by a drunken companion on the night of August 2d, 1879, a notice of which appeared at the time in the county newspapers.

"When called to visit him, we found him lying by the road side, near St. Ignatius' Church. Upon examination it was discovered that he was in a state of collapse, from loss of blood; the hemorrhage proceeding from five incised wounds. The first of these to which my attention was directed was one penetrating the cavity of the thorax. Commencing below the first rib, and passing over the second, the knife entered the chest wall between the second and third ribs, through into the lung tissue. From this wound all hemorrhage had ceased, except an occasional issue of frothy, arterial blood.

"I immediately proceeded to close the wound, taking care to leave sufficient space between each stitch for the escape of effused blood. I then applied a broad bandage around the whole chest, to lessen its expansive and contractive action. By the judicious use of stimulants, applied over the body, and administered internally, reaction was, in a considerable degree, established. I then had the patient conveyed to his home, a distance of about one mile, after which I dressed the wound upon his arm, which commenced at or near the axilla and terminated at the inner condyle of the humerus. The third troublesome cut commenced over one of the dorsal vertebræ, and ran a distance of about six inches obliquely across the trapezius and latissimus muscles. The remaining wounds were of minor importance. The whole were dressed with glycerine and carbolic acid, applied on lint.

"At this juncture, my friend and preceptor, Dr. R. D. Lee, was called in consultation, when our plan of treatment was agreed upon.

"By careful dieting, with an occasional opiate to relieve the pain and produce sleep, and by the use of gentle laxatives to unload the alimentary canal, convalescence was immediately entered upon, and the patient began to improve, without the slightest evidence of inflammatory trouble until the 16th or 17th day, when I noticed a rapid increase in the number of cardiac pulsations, which led me to suspect the beginning of some internal trouble. After a few days this suspicion became confirmed. A round or oval protuberance ap-

peared above the wound in the chest, which at this time had become nearly cicatrized. It continued to increase in size, and when it reached the dimensions of a common hen's egg, and was in a fluctuating state, we concluded to open it. An incision was made in the most dependent part of the tumor, and was followed by the escape of bloody serum instead of *pus*, as we expected. After considerable discharge we proceeded to close the aperture made by the knife, and await further developments. Within a week or ten days thereafter, the abscess, if we may so call it, commenced to discharge, and the patient lost from half a gallon to a gallon of blood. We directed our attention to this alarming flow of blood, which the patient was now losing through the wound and by the mouth. Our efforts in this direction were successful, through the use of plumbi acetas, for immediate effect, and equal parts of the fluid extract of ergot and the tincture of hyoscyamus, as internal anti-hemorrhagics, with the persulphate of iron as a local styptic. The patient rallied, though there was no diminution in the size of the abscess, which, within a week, began to discharge again, with the loss of about the same amount of blood as before. By this hemorrhage the abscess was entirely evacuated; and now a most remarkable and interesting state of affairs was presented. It was now discovered that a large portion of the lung tissue had been destroyed by gangrene, and the aorta was fully exposed to sight, to the extent of two inches, and its pulsations could be distinctly seen. A small bronchial tube communicated with the external opening, from which air was constantly making its exit. Adhesions had formed between the two pleural surfaces, producing a closed sac, which fortunately prevented, previous to its evacuation, the contents from gravitating to and pointing at the base of the lung.

"At the present time (November) the cavity, which at one time was as large as a *man's fist*, is entirely filled up, and the patient's complete recovery is now anticipated."

Remarks on Veterinary Medicine.

Dr. W. Stump Forwood then read the following paper on Veterinary Medicine:—

GENTLEMEN—The few remarks that we delivered before this Society one year ago, upon the resolutions we then offered regarding veterinary medicine, although very briefly and very imperfectly reported, nevertheless attracted unexpected attention from parties specially interested in the various domestic animals, from students, or young men contemplating the study of the diseases of the inferior animals, and from a leading veterinary college—the Columbia College, of New York. We received several letters on the subject from different sections of the country—chiefly letters of inquiry as to studentship, and as to the best institutions for obtaining a veterinary education.

This interest, excited by so few remarks, shows that the subject is one that the public is now beginning to regard with sentiments of serious consideration. The time has passed when the obloquy and ridicule brought upon the title of "*horse doctor*" by ignorant pretenders can continue to keep aloof the intelligent seekers after truth from the wide and unexplored domain of veterinary medicine. The whole subject has hitherto been brought in disrepute by the gross and criminal ignorance of those who professed its practice, and who have inflicted incalculable injury and suffering upon the helpless dumb brutes that they pretended to relieve.

The day and the hour is at hand when this midnight darkness, which in past ages has wrapped in gloom the diseases of the lower animals, must be dispelled, and those diseases be brought within the light of day. The moneyed interest that men now hold in animals, throughout the world, is almost beyond computation; and money, the great mainspring that moves the affairs of men, will now be brought to bear for the preservation of the health and lives of our animal wealth. The people—and all are interested in some degree, each possessing a dog, or a pig, if nothing else—now demand educated veterinarians. They see no reason why the same amount of ability and of study should not be applied to the detection and cure of diseases of domestic animals as that now devoted, by such a vast army of disciples, to the diseases of the human family. The presumption is that the opprobrium before mentioned as being cast upon the profession by the ignorant has been the chief cause in deterring young men of good talents from entering this field—a field yielding an abundant harvest, and yet with few reapers to secure its golden grain.

We are indebted to the Hon. John Carroll Walsh, of this county, a gentleman well known throughout the State, and who is himself a highly successful breeder of fine stock, for several copies of papers containing articles by different writers on the subject of veterinary medicine. We particularly refer to one paper furnished us by Col. Walsh—*The Turf, Field and Farm*—published in New York. The number for September 5, 1879, contains a very able and exhaustive essay, which was read before the New England Agricultural Society, Worcester, Mass., by F. S. Billings, M.V., of Boston—the first American graduate of the Royal Veterinary Institute of Berlin, Prussia.

Dr. Billings has certainly entered deeply into the research of the early literature relating to the subject of veterinary medicine and surgery; which shows remarkable talent in that direction, and commendable industry on his part. He makes Scriptural references, and states that "the Books of Moses tell the students of the Bible of the numerous animal plagues with which Jehovah punished the Egyptians;" and adds, "These laws warrant us in assuming that the Jewish priests of those early days were well acquainted with the lesions which disease made on animal organisms."

He also affirms that Æsculapius is said to have treated diseased animals as well as man. Dr. Billings adds that "Hippocrates, who lived 460–377 B.C., the father of medicine, and the compiler of all the knowledge upon this subject up to his time, has left records of no mean degree of knowledge of the diseases of domestic animals."

"Aristotle, 384–322 B.C.," continues our author, "the mightiest intellect which graced the

earth from history's beginning until long after the Reformation, and whose work will ever remain a wonder of human achievement, has given us wonderful records of comparative anatomy, and mentions some diseases of the animal world."

Dr. B., in this connection, also mentions the names of those great lights of antiquity in the early history of medicine, Celsus, Galenus, and other Roman medical men; he quotes from the "Georgics" of Virgil; refers to the writings of Cato, Varo, Columella and Vegetius; and adds that "It is in the writings of these authors that we find the words 'veterinarins' and 'veterinaria' first appearing, indicating the Latin origin of our words 'veterinary' and 'veterinarian.'"

The object of Dr. Billings' very able and highly interesting essay is to advocate a "national veterinary police code, with State execution of the laws." Also, he recommends the establishment of a National Veterinary Institute, endowed by and under the control of the government of the United States, with certain limitations to free it from the baneful influence of politics.

The National Police Code looks to the appointment of a National Veterinary Inspector General, "as an incitor and general watchman for the whole country," and also for State Inspector Generals.

Dr. Billings has evidently devoted much time and educated consideration to the details of the practical operations of the National Veterinary Institute, and of the National Veterinary Police Code, as you may judge when we state that his essay occupies nearly ten columns of closely printed matter in the *Turf, Field and Farm*, a paper of considerable size. You will, therefore, understand that, in the brief time and space now at our disposal, we cannot reproduce the merest outline of this essay. The paper is a very able one, as stated before, and should be studied in detail by all interested. The Doctor proposes to contribute liberally, out of his own private means, toward the execution of his plans. We trust that this introduction to it will be productive of good results.

The subject is one that cannot be kept in abeyance much longer. Within a few years veterinary medicine will loom up in its broad proportions, and astonish mankind that the world should have existed so long without it. When we are told from actual statistics how many millions of dollars worth of our domestic animals, in the United States, annually die from absolutely preventable diseases, as well as from those that are curable, the thought should not only occasion surprise and alarm, but should awaken each of us to a sense of responsibility and feeling of criminal neglect. Veterinary medicine and surgery now presents the largest and most profitable field of all the various departments of knowledge for the labors of young men of ability and energy; and now is the time to enter it. The early gleaners will reap the richest reward.

It is highly important that the veterinary profession yet to be developed should have a proper foundation for its future superstructure, and in obtaining this solid basis much more will depend upon the friendly influences and aid of the medical profession than upon any other class. It is our duty to extend the helping hand to our associates in comparative pathology. The same qualities that combine to make a good physician in the human family are all needed for the physician who devotes his exclusive attention to the diseases of the inferior animals. And in so far as the respectability of the two professions (if they can be separated at all) is concerned, we are unable to make any distinction whatever. The respectability of all professions or callings depends entirely upon the character, standing and education of those who practice or follow them. The veterinarian should have the same preliminary education and the same natural abilities that are required to make a good, kind-hearted, and conscientious physician among men. The medical profession proper is now overrun with a very inferior grade of practitioners. The ancient boundaries which formerly hedged in the profession from the intrusion of unqualified and incapable aspirants, by its requirements for a very thorough education, high moral qualities, and quite a considerable monied investment, have, within the last half century, been almost wholly removed, as regards some of the medical schools, at least. Almost any young man, we grieve to say, can now obtain a medical diploma at some of the colleges, without education, without moral character, and without money — "sans everything!" This is a lamentable fact, but still it is a fact. It is to be hoped that higher qualifications will, in the future, be required.

Since our remarks upon the importance of inducing young men to devote their attention to the study and practice of veterinary medicine, delivered before this Society one year ago, and briefly published in the Philadelphia Medical and Surgical Reporter, the very best weekly medical journal that we have any knowledge of—especially valuable to the country practitioner—a very excellent editorial has appeared in that journal, August 9, 1879, entitled, "Veterinary Medicine as a Career for Young Men." This editorial was based, as is stated by its writer, on a pamphlet, entitled "An Appeal to the Citizens of Pennsylvania for the Foundation of a Veterinary Department in the University of Pennsylvania."

We have not seen the "Appeal" itself, but will proceed to give some of the editor's remarks based upon it. The writer begins by stating, "This appeal is timely, able, and ought to be promptly successful. It sets forth in strong, almost startling, language the necessity for an improved condition of veterinary science in the United States, on grounds at once humanitarian and economical; and also the advantage to the young men of this country in thus opening to them a career new, beneficent and profitable.

The writer then proceeds to state that "In 1870 the money value of the live stock of the United States was appraised at a little less than $2,000,000,000, two thousand millions of dollars. The most experienced stock owners estimate the loss annually, from preventable and curable diseases, at from 2 to 7 per cent.; in other words, at from forty million to two hundred and forty million dollars every year:"

This is truly a stupendous loss to contemplate; and is especially startling from the fact that it all results from preventable and from curable diseases.

The author continues, "Hog cholera alone, a distinctly preventable disease, taxes the Mississippi Valley at from $20,000,000 to $40,000,000 almost every year. The loss in the single State of New York, from epidemic abortion in cows, has reached as high as $10,000,000 in a single year. The epizooty in horses, in each of its several visits to the United States, has been estimated to have reduced the national wealth over $50,000,000. The immense interests involved in our shipments of live horses, cattle and sheep to Europe, stand in hourly peril of destruction, from the dread of European powers at having epidemic diseases introduced there. These are but a small part of the facts and figures which the 'Appeal' before us marshals to prove the urgent call for immediate and thorough instruction in veterinary science in this country."

In the second place, the writer refers to the humanitarian aspect of the subject, remarking, "The prevention of suffering in the lower animals, as a principle of morals, is a glorious development of modern civilization; it broadens sympathy to all who can feel; it extends charity to the alleviation of every form of suffering; and it does so, not out of superstition, but from a growth of purely ethical considerations. Hence it is that the societies for the prevention of cruelty to animals have taken an active participation in the furtherance of the study of veterinary medicine."

Further on the writer adds: "The 'Appeal' most justly stigmatizes the sort of contempt with which the profession of veterinary science is regarded in the United States. It reminds the reader that in Europe the educated veterinarian is respected and recognized as a man of science; that men of position and of liberal culture, graduates of the most famous universities, have taken it up as their life work, and have shown it to be as dignified, useful and noble as any profession whatever—as any department of business. Hence it is that the appeal is made to young men of good preliminary education and prospects, to qualify themselves in veterinary medicine, rather than to enter the overcrowded, underpaid, uncertain business of the ordinary M.D. More certain pecuniary returns await them, and a greater probability of fame and fortune. Just now this advice is golden. It requires no prophet to predict that in another score of years thousands will be turning their attention to veterinary studies; while now the field is wide and the laborers few, competition is almost unknown, and all the honors are open to the earliest aspirants."

The views here expressed are identical with those that we have entertained and advocated in general conversation during several past years; and it is a subject for rejoicing that the prospects are now so favorable for their early fruition.

Our author adds, in conclusion: "It will not be long before the American public awakes to the need of veterinarians of the very highest education. Who will be the first to secure the honors and emoluments of this new opening for young men?"

We have not learned whether or not the University of Pennsylvania intends to add a veterinary department to its other branches of instruction. It would appear fitting to an eminent degree that this ancient and dignified institution of learning, especially in its medical department, should take the initiative in the establishment of veterinary science in America upon a solid and secure foundation, as it did in first founding medical teaching in the New World. Its honorable and independent position—honorable, from its high-toned record of more than a century of existence, and independent, from large endowments from the State, and from the benevolence of private individuals—would appear to render it best adapted for founding veterinary science upon a secure basis in America, and at the same time secure for it the absolutely honorable status that its inherent character and public necessity clearly entitles it to.

At the conclusion of Dr. Forwood's remarks, Dr. Lee stated that it was a well known fact in history that the great Napoleon paid his veterinary surgeons exactly the same fees, and treated them with the same consideration and respect, socially, as he paid and treated the surgeons who attended his soldiers.

Dr. Lee also remarked, as a single illustration out of many that he might recall, that his attention was not long since incidentally drawn to a suffering horse, an exceedingly valuable animal, which was being heroically treated by persons entirely incompetent and ignorant of the nature of the case, and in such a violent manner as would undoubtedly have caused the death of the dumb patient in a very short time. The Doctor's knowledge of human medical practice enabled him to make a suggestion to the parties in charge which speedily relieved the suffering and saved the life of the noble animal.

Dr. Silver added that veterinary medicine and surgery did not receive the attention which its merits entitled it to, and suggested that we physicians should lend our aid to the suffering animals, whenever possible, until the field becomes properly supplied with educated veterinarians.

Several members of the Society present expressed interest in the subject, and hoped that "Dr. Forwood's valuable paper would not be permitted to slumber here, but that it should be brought out before the general public."

It was then unanimously recommended that the paper be offered to the Philadelphia Medical and Surgical Reporter, and to the Baltimore *Maryland Medical Journal*, for publication.

The following named delegates were elected to represent the Society in the American Medical Association, at its next meeting: Drs. R. D. Lee, H. Clay Whiteford, and W. Stump Forwood. Delegates to the State Medical Society: Drs. W. W. Virdin, W. W. Hopkins, and H. B. Martin.

Before adjourning, Dr. Alex. Craig, of Columbia, Pa., extended a cordial invitation to the Society, to attend the next meeting of the "McCall's Ferry Medical Association," which meets in the latter part of August next, at the city of Lancaster. This Association, of which Dr. Craig was the President last year, and the eminent Dr. John L. Atlee is the president this

year, is entirely social in its character, as was explained by Dr. Craig. It is a meeting to which every medical man is expected to take his wife, or a lady friend. It is a day for relaxation and recreation, spent pleasantly together with physicians from different counties in Pennsylvania and the adjoining counties of Maryland; not for the discussion of professional subjects, but for forming more intimate social relations between physicians who might otherwise never meet, at least, not meet upon such common, independent, and exceedingly pleasant and social ground.

At the conclusion of Dr. Craig's kind invitation, Dr. Forwood stated that it had been his privilege to be present at the last meeting of the "McCall's Ferry Association," which was held at McCall's Ferry, and that he had there passed one of the most delightful days of his professional life. The "Association" had also honored him by placing him upon one of its most important committees. He could assure the Society that all who shall attend the next meeting, at Lancaster, next year, will return feeling fully compensated for the day thus spent.

The President announced Phthisis as the subject to be discussed at the next meeting, and appointed Dr. Virdin as the lecturer for the presentation of the subject.

The Society then adjourned, to hold a special meeting in Bel Air, as per agreement, on the second Tuesday in January.

W. Stump Forwood, *Secretary.*

Periscope.

Coto Bark in the Diarrhœa of Phthisis.

Dr. J. Burney Yeo has found coto bark of great efficacy in the graver forms of the diarrhœa of phthisis (*Practitioner*, October, 1879). He says—

I have given it in many cases of apparently uncontrollable diarrhœa, that is to say, cases of diarrhœa which were not controlled by the ordinary remedies, such, for example, as opium, bismuth, tannin, ipecacuanha, etc., and I have found it almost invariably have the effect of arresting the intestinal flux, and of relieving intestinal pain and irritation in a very short time. I say "almost" invariably, for when I first gave it I found no such good result, and on inquiry I found that one of my colleagues had employed it also without effect. This led me to consider the mode of its administration. I found my colleague had given it mixed with other substances and made into pills, and I had given it, in the first cases in which I tried it, blended with the mistura cretæ of the Pharmacopœia. It is deserving of notice, that when given in both these forms it appears inert; and one might have been induced to hastily discard it as a drug without remedial value. This is probably the fate of many valuable medicines which appear to fail; not from want of virtue in themselves, but from want of patience and attention in their mode of administration.

Finding that the fluid extract contained a resinous element, which was precipitated in tough masses when the extract was carelessly mixed with water, I had the following mixture carefully prepared:—

℞. Fluid extract coto, ♏lx
Comp. tinct. cardamoms, ♏lx.

Mix these together and triturate them slowly with mucilage of acacia, ℥ iij, and simple syrup, ℥ ij. Finally add water to ℥ vj.

A tablespoonful of this mixture is a dose. In this form it is an opaque mixture, with a not unpleasantly warm and aromatic taste. I have usually found two or three doses of this mixture arrest or check the severest forms of phthisical diarrhœa.

The bark is imported from Bolivia, in South America, and the preparation I have used is the fluid extract. The dose is from 5 to 8 minims. An alkaloid *cotoin* has been prepared from the bark, and is reported to have the same valuable properties as the extract of the bark itself, but of that I have no personal knowledge.

The Treatment of Hemorrhoids.

In the *Practitioner*, October, Dr. D. Young, of Florence, speaks favorably of the steady administration of glycerine for hemorrhoids. He adds—

I would call attention to aloes as an aperient in these cases. Out of between thirty and forty cases treated as above, and as many more treated for constipation alone, I have only found one in which aloes seemed to increase the hemorrhoidal trouble. When it is combined with belladonna and quinine, or belladonna and nux vomica, it rarely, as far as my experience goes, causes any trouble in the rectum.

I would only further suggest that much may be done preventively in these cases, and nothing is more useful in this direction than the free use of cold water *immediately* after each action of the bowels. When the hemorrhoids are inflamed warm water is generally more agreeable and soothing, but when they are in a chronic state—giving little or no trouble—the free use of cold water, in the manner presently to be described, will not only be a source of much comfort, but greatly lessen the frequency of the attacks. Not only is there a great deal of neglect in the matter of personal cleanliness, in the present day—at least as far as the bowel is concerned—but many to whom this charge would not apply, equally fail, from want of proper knowledge as to the manner in which the lower bowel ought to be bathed. When the question is put, "Do you carefully attend to bathing the rectum every

day?" the answer invariably given is "Yes;" but when you inquire more particularly, you find that it is done during the ordinary bath, before the bowels have been relieved, or at some other time, having no relation to the hour of defecation. This is where the mistake lies. The moment when the application of a cold sponge to the bowel is of so much value in preventing the formation of piles and in giving relief when they are present, is just the moment *after* the motion has passed. At the instant of the passing of the motion a partial eversion of the lower bowel takes place, and any hemorrhoids which may be lying on its surface come down with it. If paper is used, as is so universally done, in order to cleanse this portion of the rectum, the sensitive mucous lining shrinks from the rough touch of the paper, and the everted portion returns to its place only partially cleansed, and having adhering to its surface particles of fecal matter, which keep up a constant irritation, giving rise to great discomfort, even when no hemorrhoids exist.

In cases of hemorrhoids, fistulæ and ulceration, when I have had occasion to examine the rectum just after a motion had been passed, I have been greatly struck by the amount of fecal matter which was found covering the surface of the sphincters; sometimes completely obscuring a tender ulcer or other abraded part, affording a ready explanation why rectal sores are so intractable in the hands both of the physician and surgeon. I invariably prohibit the use of everything but the wet sponge. If the patient is very sensitive the application of cold water to the lower end of the bowel will sometimes cause colicky pains in the abdomen, in which case I advise tepid water, at least to begin with. All that is necessary is a little vessel about the size of a tumbler, having a lid which fits tightly, and a bit of sponge. The vessel, filled with water, is taken into the closet, and the soaking sponge freely used the moment the motion has passed. Instead of the mucous membrane shrinking from contact with the wet sponge, it appears rather to be soothed by it, and therefore the everted portion of the rectum is thoroughly cleansed before it returns within the bowel. Many have objected to this simple plan that it is troublesome and difficult to manage; but of all those who have adopted it not one but has given the same testimony, viz., that of the great benefits which they have derived from it.

Supraorbital Neuralgia Cured by Nerve Stretching.

Dr. Kocher relates, in the *Correspondenzblatt für Schweizer Aerzte*, November 11th, 1879, the case of a man, aged 32, who had for seventeen years suffered from neuralgia of the right supraorbital nerve. The attacks, at first rare, afterward became more frequent, until at last there were only brief intervals of freedom from pain. All the ordinary therapeutic measures had been tried for years without success. Dr. Kocher laid bare the nerve and three of its branches, by an incision along the upper border of the orbit, and stretched it forcibly by means of an aneurism-needle passed under it. The healing of the wound was attended with abundant suppuration. From the moment of the operation the patient was free from pain, and the neighborhood of the supraorbital nerve was anæsthetic. The patient was last seen three months after the operation; he had had no return of the pain; sensation was diminished over a space ten *centimetres* in extent, but was otherwise perfectly restored. After neurectomy, paroxysms of pain are usually observed during the first few days after the operation. As these were absent in the present case, Dr. Kocher concludes that the lesion of the nerve is less when the nerve is stretched than when it is divided. The value of nerve stretching as a substitute for excision will be greater in neuralgia of the second and third divisions of the fifth nerve, as here a much smaller wound will suffice.

Masturbation as a Cause of Insanity.

At the close of a discussion of this subject, in the *Journal of Mental and Nervous Disease*, October, Dr. Hagenbach makes the following deductions:—

1. That masturbation is an exciting cause of insanity.
2. That in a small percentage certain physical conditions are present, due to the vice, and may prove valuable aids in confirming a diagnosis.
3. That the general health of insane masturbators is always impaired.
4. That the diagnosis in the first stage usually is difficult, and comparatively easy in the second stage.
5. That the prognosis is always unfavorable, unless the practice is discontinued.
6. That daily exercise, carried to fatigue, is an important element in the successful treatment of these undoers.
7. That they are not benefited by removal to an asylum, if allowed to spend their time in idleness.
8. That certain medicines, by improving the general health and removing sexual desire, prove successful in some cases.
9. That cauterization of the prepuce, and physical restraints, as a rule, are impracticable or useless.

Reviews and Book Notices.

NOTES ON CURRENT MEDICAL LITERATURE.

——The report of the Adams County Medical Society, prepared by Dr. J. W. C. O'Neal, gives a variety of matter of local interest.

——The *Proceedings* of the Philadelphia County Medical Society for 1878 and 1879 appear in a reprint of 114 pp., with list of members, etc., from the press of J. B. Lippincott & Co.

——The *Proceedings* of the 90th annual session of the Medical Society of Delaware are included in a pamphlet of 22 pp. It embraces the minutes and articles on the tongue in malar-

rial diseases, by Dr. Wm. Marshall; on aural catarrh, by Dr. R. J. McKay; on prostatitis, by Dr. G. W. Marshall; and on gynecological subjects, by Drs. Black and Chamberlin.

——The fifth Biennial Report of the State Board of Health of California covers the years 1878 and 1879 to July 1st. Much of the valuable matter in it is owing to the labor of Dr. F. W. Hatch, the permanent secretary of the Board. By writing to numerous practitioners throughout the State, he has collected together a mass of reliable information on the diseases and sanitary condition of the State. We notice that the deaths from consumption are steadily increasing, and the explanation offered—that they are those of invalids who came to the State too far gone to be benefited—is scarcely satisfactory. There are a number of charts, tables and special reports in the volume, which we have not space to particularize.

BOOK NOTICES.

A Treatise on the Theory and Practice of Medicine. By John Syer Bristowe, M.D. London. Second American edition, revised by the author; with notes and additions by James H. Hutchinson, M.D., etc. Philadelphia, H. C. Lea, 1879.

When the author of this work first appeared before the American public, in its first edition, he was known to but few, and his writings stood absolutely on their own merit. It was, therefore, the more complimentary to him that an appreciation of his labors steadily increased as they became more widely known. His accuracy in the portraiture of disease, his care in stating subtle points of diagnosis, and the faithfully given pathology of abnormal processes have seldom been surpassed. It is true that on the matter of treatment he was and is vague and general, to a degree which is frequently disappointing; but the general principles which he defends are certainly excellent.

He embraces many diseases not usually considered to belong to theory and practice, as skin diseases, syphilis, and insanity, but they will not be objected to by readers, as he has studied them conscientiously and drawn from the life.

Speaking from several years' acquaintance and frequent reference to Bristowe's work, we can say that, beginning with some distrust, owing to not knowing his claim to be considered an authority, we have steadily increased in respect for his opinions, and in recognition of the value of his writings.

A Dictionary of German Terms Used in Medicine. By George R. Cutter, M.D. New York, S. P. Putnam's Sons, 1879. Cloth, 8vo, pp. 304.

The title of this book indicates at once its character. The very considerable attention now paid to the study of German medical authors in this country, and the number of medical men who go to Germany to attend special courses, will unquestionably cause a large demand for a book of this kind. From our examination of it, we consider it very complete and accurate—unusually so for the first edition of a lexicographical work. As an aid in reading German writers on professional topics, it will be welcome to many, and will be found quite indispensable.

The German tongue admits of so many compounds, that an aid of the kind is essential to even advanced scholars; and the unconscionable length to which they string out such compounds is well calculated to frighten a beginner; as, for example, *Bauchspeicheldrüsenzwölffingerdarmpulsader*, which single word we find in the pages before us, and the meaning of which we leave our German reading friends to analyze for themselves.

The display and typographical arrangement are excellent, and well calculated to enhance the utility of the book.

A System of Midwifery, including the Diseases of Pregnancy and the Puerperal State. By Wm. Leishman, M.D., etc. Third American edition; with additions by John S. Parry, M.D. Philadelphia, Henry C. Lea.

The popularity which Dr. Leishman's work has achieved since its first introduction to the American public has been well deserved. The author's extended experience, and the care with which he works up the various departments of his subject, are obvious to all who examine his pages.

In this edition the text has undergone careful revision by the author, and the additions made by the late Dr. John S. Parry have been mainly retained, and acknowledged by the author as highly useful in rendering his work of increased value to the American reader. Over two hundred illustrations appear in the work, and most of the recent improvements in the art of midwifery have been fully noted. It is based on the most recent English edition, which has undergone a thorough revisal at the hands of the author and his assistants.

The paper and presswork of the book are of the usual excellent character of the publisher.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Half-Yearly Compendium of Med. Science,	2.50
Reporter and Compendium, - - -	7.00
Physician's Daily Pocket Record, - -	1.50
Reporter and Pocket Record, - - -	6.25
Reporter, Comp. and Pocket Record, - -	8.25

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,
115 South Seventh Street,
PHILADELPHIA, PA.

WHY SCIENTIFIC MEDICINE RECOGNIZES NO FIXED LAWS.

In spite of the general diffusion of knowledge which is the boast of the present day, it is surprising how little the public appreciate the principles which underlie the great change which has taken place in the study of nature within the last century, and to which the marked progress of science is due.

This change was tersely expressed about the first of this century, by a famous line of the poet Schiller—

"Und grau ist alle Theorie."

Expressedlogically, it is the absolute rejection of *a priori* methods of reasoning, the recognition that, in the realm of the phenomenal world, all truth is merely relative, and that no absolute laws, no fixed and unalterable principles, have been or can be discovered. Even the simplest axioms of mathematics are true only when we consider space as having but three dimensions; but we know that space can just as well become the subject of mathematical inquiry when it is assumed to have an indefinite number of dimensions, and, in fact, treatises have been written upon it in this condition.

Hence it is that any so-called "law of nature" never can assume the relation of a dogma, or a matter of faith, to the well regulated mind. Disbelieving in the validity of any alleged *a priori* principle, such a mind is always open to the reception of new facts from any quarter. It becomes a mere question of evidence, and a weighing of probabilities. Does a refined experiment on the power of light seem to be in contradiction to the law of gravitation—the most extended and universal of all known natural laws—the properly trained mind will be perfectly ready to throw overboard the universality of gravitation when verifiable experiments require it. Does a very wide and full induction seem to point strongly to the view that an oyster, by a series of changes, can develop into a man; the cultured intellect merely asks whether the induction is so wide and so full that it overcomes the very large amount of contrary evidence which has been accumulated. If it is, the induction is accepted, not as an eternal and universal law, but as the best possible explanation as yet offered of the isolated facts brought forward. For every fact is isolated, and it should never be forgotten that between cause and effect is an unfathomed chasm which the intellect simply jumps, because it cannot ford.

All this it is especially important for the medical man to remember, for there is certainly no science where the authority of name, of system and of dogma does at this present time more hurt than just in this one of medicine. In the general public, the notion seems hopelessly ineradicable that every doctor must belong to some "school." He is allopathic or homœopathic, botanic or eclectic, hydropathic or heteropathic. When he quietly states that he owns to no school, that he acknowledges no law of disease nor law of cure, that he has no objections to learn from anybody, nor any desire to impose a positive rule on others, he is looked on as either ignorant, eccentric, or dodging the question.

This point is so well put in a recent address by

Dr. Alfred B. Duffin, Professor of Pathology in King's College, London, that we quote his words:

"A reproach constantly leveled at us is, that we possess no system. By this, I take it, the public mean some cut-and-dried series of formulæ, chiefly, if not exclusively, of theoretical origin. They seem to expect from us some thoroughgoing, all-including set of principles, elaborated in our studies, logically and harmoniously, out of our own inner consciousness. So impressed do many seem with the necessity of our fighting under some flag, that they have invented for us the term 'allopathists,' whatever that means. Our answer is, that we labor by the light of nature, and cannot go beyond the facts that have been discovered. Thank goodness, Medicine has done with these falsely called systems. She has suffered enough from them. Their vitality may be ascribed to two causes, the scantiness and tentative character of medical knowledge in times past, and the fact that they satisfy a craving, not only in the popular, but in the medical mind itself. The strength of all depended on the tendency of most functional diseases to spontaneous recovery. Many failed to perceive this, and made the most violent and blundering assaults on their unhappy patients. Homœopathy, the 'system' of the Nineteenth century, is wiser in its generation; it is content to spin theories before the imagination of its believers, and to amuse the patient while the disease runs its own course. Allied to these are those waverers who have dismissed physic and its ways from their thoughts during the day of health, and who have neither firmness nor endurance to support them under suffering. They accept our services eagerly, but quickly become disheartened and wearied; they dismiss us, and run the gauntlet of the quackeries. These are the people who are said to 'try' doctors and systems; who discard number one, about whom they know nothing, in favor of number two, about whom they know less."

So it is, that patients themselves are largely responsible for these false notions about medicine. It becomes, therefore, the duty of the physician to explain, on appropriate occasions, that we have no systems, no faiths, no pretended universal laws, for the simple reason that none of those things can exist in a science. It also becomes his duty to oppose all pretended systems which are based on dogmas, fixed laws, or alleged unalterable principles.

Notes and Comments.

Therapeutical Notes.

RECENT SUGGESTION FOR OZÆNA.

To remove the crusts, Dr. Lennox Browne, (*Medical Press and Circular*, Oct. 15,) uses—

℞.	Iodoformi,	gr. v–viij
	Ætheris,	ʒ j–iss
	Ung. petrolei,	ʒ j
	Ottar rosæ,	♏ vj.

Dissolve the iodoform in the ether, then add the others.

For a post-nasal douche:—

℞.	Ammonii chloridi,		
	Sodii boratis,	āā	gr. vi–viij
	Glycerinæ,		ʒ j–ij
	Aquam,	ad	ʒ iv. M.

This amount for two douches, at 95° Fah.

For vapor inhalations, either pine oil, creasote, or benzole, in water, at 150° Fah. should be inspired by nose as well as by throat. To whichever is prescribed, *aldehyde*, in no larger proportion than one drop to each inhalation, should be added, this drug having a peculiar and quite specific effect on favoring fluid secretions in cases of inspissated mucus, and if administered in larger doses, it is apt to produce headache or embarrassment of breathing.

In the *British Medical Journal*, Nov. 1, he gives other formulæ:—

℞.	Sodii boratis,		ʒ iij
	Acidi salicylici,		ʒ ij
	Glycerinæ,		ʒ ijss
	Aquam,	ad	ʒ iij.

One or two drachms of this mixture to the half pint of water, at 95° Fah., acted quite efficiently, whether used with anterior or post-nasal douche, or as a gargle; and this form has now been used by him for many months. It has the advantage, over and above its antiseptic qualities, of being not only non-irritating, nor obnoxious in taste, but, on the contrary, of being even emollient, and of agreeable flavor.

MECHANICAL REMEDIES IN HAY FEVER.

Several recent writers report the great relief obtained in many cases of hay fever by filtering the inspired air, either by a veil, the use of a respirator, or, as one suggests, by placing a fine sponge in each nostril, kept moist by pure water, (a little glycerine in it would be better), and accustoming the patient to breathe exclusively through the mouth.

IODOFORM AND QUINIA IN ULCERS.

In foul ulcers, scrofulous sores and sluggish wounds, Dr. C. I. Williams (*Southern Practi-*

tioner, Nov., 1879,) reports excellent results from the following—

℞. Quiniæ sulphatis, ʒj
Iodoformi, gr. xx. M.

Dust on the sore several times a day, after a preliminary washing.

A Good Tapeworm Remedy.

Drs. R. Elben and J. Mainzer, of Stuttgart, in the *Wurt. Cor. Blatt*, report excellent results from the administration of the etherial extract of filix mas, or malefern, in 10 gram (ʒ iij) doses, for the expulsion of tapeworm.

Dr. Elben was first led to use it in the following way: After having administered 20 grams of kousso to a patient suffering from tapeworm, a large portion of the worm was expelled, but no head could be found, and in about six weeks small pieces began to make their appearance again. He next determined to try the fresh pomegranate root bark, when the patient requested his permission to try the secret nostrum of the tapeworm specialist Lutze, of Braunschweig, to which, for several reasons, he consented. The patient received two vials, the contents of which were to be taken one immediately after the other, before breakfast, in the morning. The tapeworm passed away, with its head, causing no pain or distress. Dr. E. now had the medicine analyzed, and it was found that one of the vials contained 10 grams of extr. fil. mar. æth., and the other 15 grams of ol. ricini with a little raspberry juice. He afterwards obtained similar results with an extract prepared by a druggist in Stuttgart, and Dr. Mainzer likewise succeeded in ridding himself of a tapeworm after having failed with kamala and pomegranate. Both earnestly recommend it to the profession for trial.

The following directions accompany each package containing Lutze's tapeworm remedy:—

The remedy should not be taken during the menstrual period or during any severe illness. In the evening, before taking it, the supper should consist of oatmeal gruel, and a cup of wormwood tea with a tablespoonful of epsom salts should be drunk. The remedy must be taken before breakfast in the morning. The contents of vial No. 1 (ext. fil. mar. æth. ʒ iij) should first be swallowed, after having warmed it a little, and vial No. 2. (ol. ricini, ʒ ivss) must be taken two minutes afterward. After the first stool, another cup of wormwood tea with epsom salts should be drunk. A cup of coffee without milk or sugar may be taken immediately after the medicine, or a lemon may be sucked, to remove the disagreeable taste.

How to Remit Money without Risk.

As the period of the year is at hand when subscribers for periodicals are accustomed to remit for their serial literature, we take the opportunity of announcing that *we assume the risk of all remittances made us*, provided they are made in either one of five ways, to wit, either by postal order, registered letter, draft, check or express. This certainly gives scope enough. We will even assume the risk, if bank notes are placed in a letter *in the presence of the postmaster*, and a memorandum made by him that he receives the letter at the time. But we *cannot* assume the risk of cash supposed to be put in a letter and mailed, or supposed to be mailed miscellaneously. No one should ask us to do so when so many ways are open to every one now to forward by mail with entire safety.

In this connection readers will pardon us for expressing the hope that they will renew their subscriptions promptly, and thus avoid all irregularity in the receipt of their journal. We hope all will write us without our having to remind them again on the subject.

Signs of Death by Drowning.

In the *Annales d'Hygiene et de Med. Legale*, Drs. Bergeron and Montano give the following signs as establishing death by drowning: 1. The presence of frothy foam, not only in the pharynx and the larynx, but also in the bronchi, is the constant sign of death by submersion, whether syncope or asphyxia predominated in the mode of death, and whether the individual was free in his movements or was thrown into the water after having been made insensible by opium or chloroform, or was partly suffocated, or was fettered in his action. This absolute constancy of the presence of foam, whatever the special condition in which the submersion occurred, is, in the opinion of the authors, the single sure uniform sign proving death by drowning. 2. There is always a certain degree of congestion, and sometimes sub-pleural ecchymoses are seen; but these ecchymoses, which give the lungs a spotted or speckled look, are unlike the punctate ecchymoses of suffocation. 3. The intensity of the hyperæmia and the extent of the ecchymoses are always in proportion to the efforts of the animal while struggling against submersion. It is the same also with the human subject, as has been verified in all necropsies made by the authors at the morgue in Paris during the last ten years. This fact permits one at a necropsy to learn concerning what

passed in the last moments of life, to know whether or not the individual struggled long and vigorously during the act of drowning.

On Saccharated Extracts.

This form of preparing medicinal substances promises favorably. In a paper before the American Pharmaceutical Association, Mr. C. S. N. Hallberg thinks that a more equal and uniform preparation than ordinary extracts is the crude drug. The proposed new preparation is a powder of sugar of milk containing the extractive matter of the drug, and of such a strength that the finished product equals in weight the weight of the drug originally used; thus one grain of the saccharated extract will represent the same weight of the crude drug, the inert matter being replaced.

Action of Duboisia and Atropia.

In a study of these alkaloids, in the *Practitioner*, October, Dr. Sydney Ringer reaches the following conclusions:—

Duboisia possesses the same properties as atropia, but is far more powerful than atropia. Mr. Tweedy found this to be the case in regard to the local application to the eye. But while duboisia is far more powerful than atropia on man, the reverse is the case in respect to frogs.

Atropia paralyzes far more powerfully the motor nervous system, the heart and respirations, in frogs, than duboisia.

Correspondence.

Peculiar Sequelæ of Malarial Poisoning.

Ed. Med. and Surg. Reporter:—

Malarial fevers, with their diversity of symptoms and endless complications, constitute at least nine-tenths of the prevailing diseases of this and many other portions of the Southern and Western States. Consequently I deem it a sufficient apology for offering a few facts in reference to the peculiar, and often unlooked-for, effects of malaria upon the human system. I will give a brief history of two cases.

Case 1.—Eddie F., aged 10; white. Parents healthy, and no evidence of constitutional taint. I was called to see him October 4, 1877, and found him suffering with a very common type of intermittent malarial fever; was attacked the preceding day (October 3) with a chill, which was followed by high fever, of several hours' duration. On the day I visited him (October 4) and the day following he had similar attacks, after having taken fifteen grains of quinine, which was given during and after the sweating stage of each paroxysm. As the fever recurred about the usual hour on October 5th, I gave twenty grains of quinine during and after the sweating stage. Visited him October 6th and found him apparently much better. The severe pains of the head, back and bowels, of which he had been complaining, had entirely subsided.

The usual hour for the febrile exacerbation was about passed, and I felt sure that the case was progressing excellently and would soon be well.

Thinking that the patient was safe from another attack I left him, with directions to take some quinine the next day. A short time after leaving the patient I received a hasty summons to visit him, the messenger saying that "the sick boy could not live an hour longer." Wondering what could be the cause of alarm, I returned, to find him unable to speak or even open his mouth; the saliva exuding from his mouth like one with an epileptic fit. His circulation and respiration were normal, and I was puzzled to account for the peculiar condition the case had assumed.

I questioned him in reference to pain; he answered, by shaking his head, that he was not in pain, except slight pain in the abdomen. I tried to open his mouth, but failed, after using considerable force. I remained with him, giving hydrate of chloral and bromide of potassium by enema, hoping that it would relieve the muscles of mastication, deglutition, etc.

This condition of affairs continued three or four hours, and subsided, as did the fever of preceding day. After recovering the use of his jaws he could not swallow for some "little time" afterward.

In answer to my many questions he said that he knew all that we were doing and saying, and that the reason that the saliva came from his mouth was because he could not swallow it, and that he moaned and fretted because he was frightened, and could not speak or swallow.

Thinking that the symptoms were directly or indirectly caused by the malarial poison acting upon the brain and nervous system, I ordered that he should remain in bed until the following day, and take fifteen grains of quinine, in divided doses, with bromide of potassium and belladonna, to anticipate another attack on the following day.

As I feared would be the result, the same condition returned about the same hour the following day (October 7th), with temporary paralysis of the right arm. After three or four hours the symptoms all passed away, leaving the patient not only cheerful and quiet, but entirely free from all the unpleasant symptoms. Treatment continued.

On the following day (October 8th), about the usual hour, and for the same number of hours, all of the symptoms returned, but in a milder degree. At my request for consultation Dr. Murchinson was called. He concurred with me in my diagnosis, and we continued treatment, with the addition of strychnia sulph., grain $\frac{1}{30}$, to be given every six hours.

October 9th. All the symptoms returned at the usual hour and continued the usual length of time, but less severe than on preceding day. Treatment continued.

October 10th. There was no return of symptoms, and patient made a rapid recovery.

Case 2.—Called, September 29th, 1878, to see Mollie B., age 11, white, daughter of healthy

parents. Found her with high fever, having had chills and fever for several days. The parents were greatly alarmed, thinking that she was was dying, and it was almost impossible to persuade them that she was not in any particular danger. Her condition was almost precisely like my first case, except that this peculiar episynanche with trismus came on during the febrile exacerbation. She was entirely unable to open her mouth or to swallow anything.

I saw that the fever was of the intermittent type, and would soon decline, consequently I waited until the fever, and the spasm with it, passed off, which was in a few hours after they came on.

What was noticeable in this case was, that as soon as the fever declined she was restored to perfect quiet and cheerfulness, with the ability to take quinine, which I prescribed, and which entirely prevented any return of fever or other troublesome symptoms. She made a rapid recovery.

I do not offer anything new in the treatment of malarial fever, yet, if by reporting these cases I can help other practitioners to understand these unusual phenomena, and save them the anxiety and suspense which I have felt, it will reward me for my time spent in writing.

P. H. Thompson, M.D.

Bluffton, Clay Co., Ga.

Double Pneumonia and Abortion.

Ed. Med. and Surg. Reporter:—

On the 11th of March I was called to see, with another physician, a white woman, aged thirty-three; skin very hot, both cheeks flushed, eyes suffused, respiration about 23, pulse 120. Complained of severe pain in both sides of the chest. Cough constantly. Both sides dull on percussion, right side more involved. Respiratory murmur at upper part of both lungs very loud, accompanied by some fine crepitation. Tongue very broad and flat, deeply furrowed in centre, base covered with a dense, dirty, brownish fur, lips red, breath very offensive. Diagnosed double pneumonia. Ordered a large mush poultice, to cover both sides of the thorax, to be as hot as the patient could endure it. Acetate of ammonia, in one drachm doses, to be given every three hours. Five grains of dextro-quinine every six hours. Eleven A.M. next day pulse was 120. Right lung more involved, pain more acute, respiration more rapid, mouth dry, tongue more brown, fissure deeper, heat of skin 103½. Ordered poultice to be continued, and increased my dose of dextro-quinine to twelve grains, to be given at once, and repeated in four hours. At nine P.M saw the patient; complained of diarrhœa. Three doses of dextro-quinine were taken, and the symptoms were much improved. For the diarrhœa a few drops of Monsell's solution of iron were ordered every hour. Nourishment principally consisting of milk. Dextro-quinine was given only twice during the night. On the morning of the 12th symptoms much improved, though the dullness was as great, but heat and restlessness abated somewhat; diarrhœa under control. During the next two days the acetate of ammonia was continued in one-drachm doses, every four hours, five grains of dextro-quinine to be given three times a day.

On the 15th I was called in haste to her. Found pulse 135, respiration very rapid, skin very hot; two slight convulsions came on while I was with her. Ordered beef tea and milk to be given frequently, in small quantities. Tincture of veratrum was given in small doses every hour. Four o'clock I saw her again; was told that labor pains were on her. She was four months advanced. Made a vaginal examination, and found the os dilated, perineum soft and yielding, but little hemorrhage, and before I left the house the fœtus was expelled, minus the placenta. The shock this abortion inflicted on the system was fearful; she became semi-comatose, pulse went up to 150, small and thready, breathing diaphragmatic. Several convulsions then came on. Hard ones were on her in twenty minutes or more. Face was pale, skin of body intensely hot, while the extremities were cold. Something had to be done forthwith, and as I put about as much faith in dextro-quinine as most men do in a good brake on an express train, I poured out what I thought to be a good twenty-grain dose of that drug, which was dissolved in a solution of tartaric acid, and poured it down her throat. This was repeated in an hour. It was certainly marvelous to witness the effects produced. In two hours the pulse was reduced forty beats, and the skin much cooler. Though the convulsions did not entirely subside in that time, they were very much lessened. In three hours more I gave her ten grains again; by night she recovered her senses. Next day I found, to my surprise, that there was very much less solidness of lung than at any other time since I first saw her. I removed the placenta with a hook this day; but very little hemorrhage occurred at any time. The dextro-quinine was now combined with Squibb's tincture of iron, five grains to thirty drops every three hours. From this time on the convalescence went on uninterruptedly. I make no comments on this case, but would ask the attention of the profession to the line of treatment followed, which I believe will be found a successful one in cases, both of double pneumonia, pleuro-pneumonia, intermittent fever, and allied diseases.

L. A. Rutherford, M.D.

Macon, Ga.

The Northwestern (Ohio) Medical Society.

Ed. Med. and Surg. Reporter:—

The "Northwestern Medical Society," of Ohio, met at Lima, Ohio, last week, on Thursday, and remained in session during Friday.

Our meeting was made particularly interesting by the presence of Professors Dawson and Reamy, of Cincinnati. Several valuable papers were read and discussed, as "Specialists;" "Croup and Diphtheria; are they identical or not?" "The Eye in some of its Surgical Relations." A novel, as well as interesting feature of our communications was a paper by a young veterinary surgeon, a graduate of a Canadian institution. The paper was on comparative anatomy, "The Diseases, or some of them, which "Man

and Beast have in common, and their Treatment." The young man, Dr. Smeal, who seemed to be quite competent, was interrogated on several points. Do the veterinarians medicate hypodermically? Answered, they did. What is the comparative dose of medicine as to man and horse? Answered as 8 to 1. Prof. Dawson said he had given 6 grains of morphia, hypodermically, recently, to one of his horses that was in agony of colic and the relief was prompt and perfect, the horse having recovered in a few minutes. The discussion here went off on the comparative merits of the gelding and the perfect horse; as to their comparative usefulness, teachableness and docility. Professor Dawson said that he had tried that, and it was no good; while Prof. Reamy said, when he was in Paris he frequently saw French ladies driving the entire horse; indeed, a thoroughbred French lady would drive no other.

Lima, Ohio. H.

[Dr. TELLOR, in his *Diseases of Live Stock*, p. 44, gives full directions for the use of the hypodermic syringe in horses and cattle.—ED. REPORTER.]

NEWS AND MISCELLANY.

Presentation of the Portrait of Professor Meigs, at the Jefferson Medical College; a Touching Tribute to the Memory of a Deceased Teacher by the Students of his Class. An Interesting Occasion.

At the close of Professor Da Costa's lecture, on Friday, December 12th, 1879, the Trustees and Faculty of Jefferson Medical College stepped into the arena, by previous invitation from the class. At this moment a life-size portrait, in oil, of the late Professor James Aitken Meigs was unveiled, which had been purchased by voluntary contributions from the students in attendance upon his lectures. Professor Wallace announced that the artist, Mr. Pettit, of this city, had never seen Professor Meigs, but had merely a small *carte de visite* vignette photograph as his guide; under these unfavorable circumstances he had succeeded admirably in preserving the likeness of the departed professor. The unveiling of the picture was followed by a murmur of applause. The orator appointed by the class, Dr. H. B. Lowry, of Proctor, West Virginia, now stepped forward, and addressing the President of the Board of Trustees, paid a glowing tribute of honor and admiration to the memory of Professor Meigs, in the name of his fellow members of the class, whose esteem and gratitude had found expression in the presentation of a portrait which in future will prove to be, to those who knew him and to succeeding generations of students, the strongest reminder of the man himself.

Want of space forbids the reproduction of the entire address, which was listened to with deep attention and followed by general applause. We cannot refrain, however, from giving short abstracts, containing some of the references to the late Professor, which will serve to show the sentiments with which he had inspired the minds of the students, and their estimate of his abilities as an instructor. The orator said:—

"Of the sterling worth, of the force of character and the profound learning of our late teacher I would not presume to speak. . . . Intellectually and morally the influence of the teacher upon the student is most potent. . . . Our late Professor had many qualifications of a teacher that were quite remarkable. His systematic method of inquiry, of using facts in hand in ascertaining unknown truths, contributed largely to his success. . . What man has succeeded in making an abstruse science more comprehensive than did our admired Professor that of physiology?

"The one thing, I am sure, however, that will prove most beneficial to all who had the pleasure of hearing this man lecture, was the interest in the study of physiology which he must have awakened in every mind. No man could have carried a greater enthusiasm into his work than did Dr. Meigs, with what effect you all know. May his healthful influence long be felt in the moulding of many professional lives.

"How his sudden departure from us made every man realize that he had lost a great teacher and a good friend; how his colleagues, by telling the simple story of his life, pronounced the highest eulogies; how a sudden gloom was cast over the Faculty and students of Jefferson Medical College; I need not now dwell upon.

"But, Mr. President, in order to put our admiration in a more tangible form than of mere hollow-sounding epithets, and as a means of recalling pleasant memories to his patrons and colleagues, as well as to the alumni of this institution, and as a legacy to those who may come after us, on behalf of the students of 1879–80, I have the great pleasure of presenting you with the portrait of him who "with learning coupled large integrity," our late lamented teacher, Professor Meigs."

Dr. Gardette, on behalf of the Trustees, accepted the trust, and with some emotion, spoke as follows:—

GENTLEMEN OF THE CLASS OF 1879–80—The Board of Trustees, can but sympathize deeply in this act of grateful and gratifying respect to the memory of your late Professor, Dr. J. Aitken Meigs, which is highly creditable to the students from whom it spontaneously comes, as has just been so eloquently conveyed by their own appointed orator. In the name of the Trustees, I accept and honor this gift to the institution, and return their sincere thanks. The portrait does credit to the artist, and brings back a smile of approbation to his class; it shall have place on the college wall, by the side of other distinguished Professors, who, by their learning and good teachings, have advanced "the Jefferson Medical College of Philadelphia" to its present high standing among the medical schools of our country.

The portrait will be hung in the amphitheatre of the new hospital, which is already adorned by the portraits of Professors Gross and Pancoast, and the former Dean, Prof. Dunglison.

—Inspector Dr. A. P. Brown reports that malarial fevers are prevalent in Texas, but no contagious or infectious disease.

The Audiphone.

This new instrument was tried last week, in this city, at the Pennsylvania Institution for the Deaf and Dumb, by Mr. Richard S. Rhodes, of Chicago, who, having long experienced the privation of infirm auditory organs, invented a carbon disc, the testing of which, as a conductor of sound, was the object of the trial The apparatus for the experiments consisted of a grand piano and several audiphones. The new invention consists of a vulcanite disc, of say eight by ten inches, attached to which is a handle, which gives it much the appearance of a fan. The material is very flexible, and silken cords on its lower side, fastened to the upper end and concentrating at the handle, serve to bend it to any desirable degree. The vibration of the instrument, which conveys the sound to the auditory nerves by contact with the teeth, is increased in intensity in proportion to the degree to which the audiphone is bent. A clamp serves to secure the string at the desired point. Mr. Rhodes, the inventor, remarked, introductorily, that only those whose auditory nerve was not wholly dead could be benefited. Very few, however, even of those born deaf, are totally without sense of sound; hence nearly all of those educated in the asylums may be taught to speak, inasmuch as their dumbness is owing solely to their want of use of the organs of speech. The results were exceedingly satisfactory, and illustrated fully the value of this new invention.

Marrying Near Relations.

The present king and queen of Italy are first cousins, and their only child is extremely delicate; but so also are both parents. On the other hand, the natives of Pitcairn Island, colonized in 1789 by nine mutineers of the ship "Bounty," are ideals of health, in spite of constant intermarriage. The commander of the British ship "Opal," who quite lately touched at the island, reports the present population at ninety-three, and "all in excellent health." It is remarkable, that with the number of necessarily consanguineous marriages these people do not show the supposed results of such marriages in their offspring. On the contrary, all who have seen the mixed native and English descendants of the original settlers describe them as models of physical strength and perfection, the young girls even being "as strong as horses and as fleet of foot as deer," carrying heavy burdens up and down the rocks with equal grace and ease. Their out-door life, their lovely climate, and their temperate and frugal habits, are the cause.

Measles at Cape Clear.

Measles has been prevalent in a most malignant form at Cape Clear, Ireland. But what wonder? Recent observers say that Cape Clear Island contains about four hundred people, living in wretched hovels. Measles being introduced among them from a neighboring village, the disease assumed a malignant form and attracted the attention of the local government board of health. Dr. Brodie was sent to investigate; he describes, as a type of the dwellings, a cabin fifteen feet long by eight wide and six feet high. In the single room nine persons, men, women and children, sick and well, were huddled together. The one window was permanently closed, and the door and chimney afforded the only ventilation.

OBITUARY NOTICES.

—Dr. W. H. Peckham died suddenly, at his residence in New York city, December 7th. He had retired from practice for a number of years.

—Dr. Edward Strudwick, of Charlotte, N. C., died last week, from a large dose of belladonna tincture taken by mistake. He was 80 years of age.

—Dr. B. Lincoln Ray died at his home in West Philadelphia, on December 9th, at the age of 43 years. He was a son of Dr. Isaac Ray, and was himself a well-educated physician and a cultivated gentlemen. He was well known as a musician also.

—Dr. Enoch Cobb Wines, who was eminent in both the new and the old worlds, from his work in the cause of prison reform, died at Cambridge, Massachusetts, on December 10th. He did good service for the New York Prison Association, for a period of ten years, and in 1870 founded the National Prison Association, of which he was secretary at the time of his death.

—The eminent French physician and naturalist, Dr. Jean Charles Chenu, died recently, at the age of 71. His first publication was a treatise on cholera morbus (1835); his second an essay on thermo-mineral waters (1840). He next applied himself to the preparation of his great folio work, "Conchological Illustrations, or, Description and Figures of all Known Shells, Living or Fossil, with the new Genera and the latest discovered Species" (1842–1847). In 1852 he became librarian of the School of Military Medicine, made the campaign of Crimea in connection with the ambulance service, and was director general of ambulances during the siege of Paris.

MARRIAGES.

HICKMAN—HICKMAN.—At York, Pa., Oct. 30th, by Rev. T. M. Crawford, J. W. Hickman, M.D., and Miss H. J. Hickman, all of York county, Pa.

KARR—KING.—On Thursday, Nov. 27th, 1879, at the residence of the bride's parents, at North Bend, O., by Rev. Ransom E. Hawley, pastor of the Presbyterian church at Cleves, Gen. Chas. W. Karr, and Miss Elizabeth Platt, daughter of Prof. John King, M.D.

SMITH—FERGUSON.—At the residence of the bride's father, in Granger, N. Y., Oct. 15th, 1879, by Rev. Isaac Harris, Mr. Andrew Smith, M.D., and Miss Anastasia Ferguson, all of Granger, N. Y.

DEATHS.

CHATHAM.—In this city, on the 26th ult., at his residence, Benjamin F. Chatham, M.D.

LONGSHORE.—In this city, on 12th month, 5th, 1879, in the 71st year of his age, Joseph S. Longshore, M.D.

MURRY.—Nov. 18th, very suddenly, of heart disease, John S. Murry, M.D., in Murrysville, Pa., in his 53d year.

PECKHAM.—In New York city, on Saturday morning, Dec. 6th, at his residence, No. 185 Fifth avenue, Walton H. Peckham, M.D.

HORSFORD'S
Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges

MANUFACTURED BY THE

RUMFORD CHEMICAL WORKS,

1155-1206 PROVIDENCE, R. I.

DE DUDLEY'S EMULSION DE
OF PURE
NORWEGIAN COD LIVER OIL
PANCREATINE
AND
DE LACTO-PHOSPHATE OF LIME DE

FORMULA.—Each fl. oz. contains six grs. of Pancreatine, sixteen grs. of Lacto-Phosphate of Lime, twenty-five per cent. of Glycerine, and **fifty** per cent. of Norwegian Cod-liver Oil.

THE ONLY PANCREATIC EMULSION MADE IN THE UNITED STATES.

This preparation is respectfully submitted to physicians as being **always** reliable. Although well aware that Cod-liver Oil Emulsions have fallen into deserved disrepute, yet we are confident this will stand any test or trial it may be subjected to. It contains no GUM ARABIC, TRAGACANTH, ALBUMEN, SACCHARINE OR ALKALINE MATTER; therefore, it will not SAPONIFY, FERMENT nor RANCIDIFY. The addition of **Pancreatine** insures rapid and complete assimilation, enabling patients with very weak stomachs to easily retain and digest it.

Guaranteed to keep in any climate. Physicians supplied with samples (express paid) on application.

DUDLEY & CO., Pharmaceutical Chemists,

Laboratory, 397 and 399 Pearl Street. **423 Fulton Street, Brooklyn, N. Y.**

MESSRS. DUDLEY & CO.: *Dear Sirs*—Though your EMULSION has not been before the profession a long time still I have used it quite extensively in my practice, and can truly say I think it one of the most elegant preparations of Cod-liver Oil I have ever prescribed. I find it can be readily taken and borne by the most delicate stomach, and the PANCREATINE and PHOSPHATES make its administration desirable in a large number of cases other than phthisical. In fact, there are few cases of mal-assimilation and general debility in which its administration will not do good; and it gives me pleasure to recommend it to my professional brethren.

1179- HOMER L. BARTLETT, M.D., Brooklyn, N. Y., Consulting Surgeon Kings County Hospital.

NEW REMEDIES.

FLUID EXTRACTS.

Coto Bark.—From BOLIVIA. Almost a specific in acute and chronic diarrhœa, cholera, cholera morbus, etc.

Cascara Sagrada.—(**Rhamnus Purshiana.**) From the PACIFIC SLOPE. A certain remedy for habitual constipation; and very useful in all cases where a laxative or cathartic is indicated Beware of the fluid extracts of spurious varieties of this bark.

Folia Carobæ.—From BRAZIL. A powerful alterative, which exerts a marked curative action in syphilis, scrofula and kindred disorders.

Rhus Aromatica.—A remedy in diabetes, and other diseases of the genito-urinary organs.

Damiana.—(**Turnera Aphrodisiaca.**) From MEXICO. The best known aphrodisiac. Of great value in impotence, spermatorrhœa, and loss of sexual appetite.

Boldo.—(**Peumus Boldo.**) From CHILI. The new tonic. Very useful in dyspepsia, hepatic torpor, yellow fever, etc.

Berberis Aquifolium.—From CALIFORNIA. Has marked alterative and tonic powers, and has been used with extraordinary success in salt rheum, psoriasis, eczema, scrofula and syphilis.

Black Haw.—(**Viburnum Prunifolium.**) From the UNITED STATES. Employed to prevent abortion and miscarriage.

Grindelia Robusta.—From CALIFORNIA. A valuable curative agent in asthma and diseases of the air passages.

Grindelia Squarrosa.—From CALIFORNIA. Anti-malarial. Used in enlarged spleen and other malarial diseases.

Cereus Bonplandii.—(**Cereus Grandiflorus and Cereus McDonaldii.**) From MEXICO. Heart sedatives. Very useful in controlling functional and organic disturbances of the heart.

Kaki.—(**Diospyros Kaki.**) From JAPAN. Peculiar action on the mucous surfaces. Useful in mucous dyspepsia, typhoid fever, etc.

Cercis Canadensis.—Indigenous. A positive remedy in chronic diarrhœa, dysentery, etc.

Jaborandi (diaphoretic). **Guarana** (sick headache). **Fucus Vesiculosus** (anti-fat).
Bearsfoot (enlarged spleen). **Coca** (nervous stimulant). **Kava Kava** (Gonorrhœa).
Eucalyptus Globulus (antiseptic and anti-malarial). **Yerba Santa** (coughs).
Yerba Reuma (catarrh). **Wood Betony** (dyspepsia). **Ustilago Maidis** (oxytocic).
Penthorum Sedoides (catarrh). **Soap Tree Bark** (tooth wash).

CRUDE DRUGS.

Goa Powder (ringworm and diseases of the skin). **Gurjun Balsam** (a substitute for Copaiba).
Alstonia Constricta (a substitute for Calisaya).

SUGAR-COATED GRANULES.

Calcium Sulphide 1-10 gr. (for the cure of boils and carbuncles).

Our limited space prevents our describing in detail the history and application of each remedy, but to those interested in NEW REMEDIES, we will say, that we can furnish interesting information relative to the above new drugs.

PARKE, DAVIS & CO.,

DETROIT, - MICHIGAN.

Our New Remedies can be procured of the Drug Trade throughout the United States. By specifying **"P., D. & Co.'s"** in all cases, you will ensure reliable preparations of the **true drugs.**

A YOUNG GRADUATE DESIRES, FOR A moderate remuneration, to form a sort of partnership with an older practitioner. If mutually satisfactory, would ultimately buy out his practice. Or, would pay a high commission, for a number of years, on the actual value of a retiring physician's practice. No real estate wanted. Address, "DOCTOR, 509 Queen Street, Philadelphia." 1190-91

PARIS EXPOSITION, 1878.

We take pleasure in stating that we were awarded a

SILVER MEDAL

FOR OUR EXHIBIT OF

SOLUBLE-COATED PILLS

AT THE

Universal Exposition, Paris, 1878.

This being the *only Silver Medal* (the HIGHEST RECOMPENSE awarded to Pills), is conclusive evidence as to the superior merits of our Soluble-Coated Pills, as compared with all other kinds and justifies the claims we have always made for the excellence of our manufactures.

WYETH'S

DIALYSED IRON.

(FERRUM DIALYSATUM.)

A Pure Neutral Solution of Peroxide of Iron in the Colloid Form. The Result of Endosmosis and Diffusion with Distilled Water.

PREPARED SOLELY BY

JOHN WYETH & BRO.,

PHILADELPHIA.

This article possesses great advantages over every other ferruginous preparation heretofore introduced, as it is a solution of iron in as nearly as possible the form in which it exists in the blood. It is a preparation of invariable strength and purity, obtained by a process of dialysation, the iron being separated from its combinations by endosmosis, according to the law of diffusion of liquids. It has no styptic taste, does not blacken the teeth, disturb the stomach, or constipate the bowels.

It affords, therefore, the *very best* mode of administering

IRON

in cases where the use of this remedy is indicated.

The advantages claimed for this form of Iron are due to the absence of free acid, which is dependent upon the perfect dialysation of the solution. The samples of German, French and American Liquor Ferri Oxidi Dialys. which we have examined give acid reaction to test paper. If the dialysation is continued sufficiently long, it should be tasteless and neutral.

Our dialysed Iron is not a saline compound, and is easily distinguished from Salts of Iron, by not giving rise to a blood-red color on the addition of an Alkaline Sulpho-Cyanide, or a blue precipitate with Ferro-Cyanide of Potassium. It does not become cloudy when boiled. When agitated with one part of Alcohol and two parts of Ether (fortior), the Ether layer is not made yellow.

Physicians and Apothecaries will appreciate how important is the fact that, as an antidote for Poisoning by Arsenic, Dialysed Iron is quite as efficient as the Hydrated Sesquioxide (hitherto the best remedy known in such cases), and has the great advantage of being always ready for immediate use. It will now doubtless be found in every drug store, to supply such an emergency.

Full directions accompany each bottle.

Physicians will find our DIALYSED IRON in all the leading drug stores in the United States and Canada.

It is put up in bottles retailing for **ONE DOLLAR**, containing sufficient for four months' treatment. Large size is intended for hospitals and dispensing. Retail at $1.50. Price Lists, etc., sent on application.

JOHN WYETH & BRO.

THE

MEDICAL AND SURGICAL REPORTER.

No. 1191.] PHILADELPHIA, DECEMBER 27, 1879. [Vol. XLI.—No. 26.

Editorial Department.

THE CLOSE OF '79.

As the year draws to a close, and a new year and another decade opens, we may congratulate our readers on the brightening prospects which are before them and this country generally at this moment. After a seven years' servitude to "hard times," falling prices, failing business, and scant collections, it looks now as if we are really and permanently entering upon a period when all that will be reversed.

Hearing, as we do, directly, in various business relations, from nearly ten thousand physicians every year, we are in a better position than most, to appreciate the effect which these latter years have had on the incomes of medical men. We know that it has been disastrous, and no class has escaped. The well-established family practitioner of the thriving rural district, the distinguished professor of the city and the specialist of high repute, have, as a rule, experienced a marked and heavy diminution of their receipts, along with the struggling aspirant, the factory doctor, and him whose residence was in the depressed mining region. Two very eminent surgeons of this city, whose names are doubtless familiar to every reader of this journal, have, in conversation with us, estimated the decrease in their receipts at 25 and 33 per cent. Partly this arose from the diminished number of patients from a distance, partly from the inability of those who applied for advice to pay for it as liberally as formerly. In fact, one of these gentlemen said the most eminent members of the profession felt the times most keenly, as so much of their practice was in consultation, and seeing patients from a distance, both of which not absolutely necessary expenditures patients and their families have been obliged to retrench.

With the restoration of a metallic currency, a resumption of regular work by mines, mills and factories, average or excellent crops of cereals and cotton, the development of paying mines, large importations of European gold, and a settled financial policy by the central government, all of which are now ours, it is apparently impossible that that "career of prosperity" which has been so anxiously looked for can delay its appearance any longer. It is here, at our doors, and as 1880 wakes us up on New Year's morn, the beaming infant brings not merely the customary good wishes of the season, but glad and positive promises of many years of cheering progress, of improvement in national and individual enterprises, of comfort, of ample food, of well paid work for the willing, of increased happiness to all who will honestly seek and therefore merit it.

It will not, indeed, come upon our profession with a rush, but slowly, imperceptibly to the impatient, yet for all that, surely; not with the noise and dash of a wave, but like the mighty tide which, gathering its strength far at sea,

climbs the shore with slow and resistless force, keeping right on until its appointed limit is attained.

Therefore, while we labor, we must also wait. The discouraging years have passed; those ahead of us shine with brighter promise, and the wealth which is now so rapidly accumulating in this country is certain to benefit our profession finally, in all its material aspects.

To conclude with a word of ourselves: The approbation of the profession which has enabled us to pass through this gloomy period of our country's history without failing in any of our engagements to our readers or business friends, will, we trust, be continued and increased in the brighter times ahead. No pains will be spared to merit this. The best writers and the most judicious reporters, translators and compilers will be sought for, to aid in the literary management of our periodicals. Improvements in their manufacture will constantly be aimed for; and suggestions from readers will at all times be welcome, and receive careful consideration as to emendation in any of these points. Those who are kind enough to think well of what we have done, will oblige us yet further if they will speak, as occasion offers, a good word for us to their medical neighbors.

Notes and Comments.

Crystallized Salicylate of Physostigmine (Eserine).

From having observed that aqueous solutions of salicylates of alkaloids keep well, Merck, of Darmstadt, was led (*Wien. Med. Presse*) to combine the alkaloid of the calabar bean with salicylic acid. The result was favorable, as he obtained colorless shining crystals, which he had not succeeded in doing from the sulphate. They are soluble in twenty-four parts of strong alcohol and in one hundred and thirty parts of water at ordinary temperature. Dissolved in hot water a 1.5 per cent. solution will, after cooling, keep clear for weeks. It is claimed that a solution of salicylate of physostigmine will not turn red as soon as that of the sulphate, and that the discoloration will be less intense. Its effect is also said to be fully equal to that of the sulphate, and its use attended with less pain. From these considerations Dr. Konigstein, of Vienna, was led to try it, applying a solution of the sulphate to one eye and one of the salicylate to the other, and from these experiments he obtained the following results:—

1. That the pain attending the use of the salicylate is fully as severe as that attending the use of the sulphate.

2. That its effect on the pupil and on accommodation is less, both with regard to duration and energy.

3. That it does not keep any better than the sulphate.

The price of the salicylate is considerably higher than that of the sulphate, and, as it offers no particular advantages, it is not likely that it will come into universal use.

What is Hyalin?

At the last meeting of the Association of German Naturalists and Physicians, in the Pathological Department, Professor Recklinghausen spoke of "Hyalin," a body which is some form of fibrine, and which was described recently by Langhaus as "canalized fibrine." This substance, which is of hyaline structure, is found either in the lumen or in the wall of small arteries, and in areolar tissue in different pathological processes; thus it is found in the kidney in cases of senile gangrene; it is found in aneurismal sacs and in diphtheritic membranes; it is identical with Gull and Sutton's capillary fibrosis, and is evidently related to amyloid degeneration. Experiments on frogs have led Professor Recklinghausen to believe that hyaline is altered cell protoplasm, which leaves the cell without the latter undergoing any material changes.

The Treatment of Diphtheria.

A correspondent in Ohio writes:—

I have been in practice twenty-eight years, and have seen diphtheria, I think, in all stages. I am satisfied that the only treatment that can be depended on here, at least, is nitrate of silver to the throat, when ulcerated; when not, chlorate of potash internally, with coal oil, or anything else externally that will keep it a little irritated; with mercurial enough to make the secretory organs act, and all the quinine the system will bear.

This plan is as good as another, but we doubt if it would have better results than several other and different methods.

The Cause of Scurvy.

Dr. Little, a British medical officer in India, presents some new views on this subject:—

The injurious effects of cold and moisture in the production of scurvy are generally admitted; but, in addition, Dr. Little believes that large quantities of salt in the soil is an important factor in its production. Last year scurvy in Northern India was unusually prevalent, and also the rainfall was unusually heavy, so that the subsoil was saturated with water, and the level of the wells rose to within a few feet of the surface. The salt present in the soil being dissolved by the subsoil water, would naturally find its way to the wells. This view is borne out by the civil surgeon of Akola, India, who arrived independently at the same conclusion after investigating another epidemic of the same disease. It may be observed that Niemeyer has pointed out that scurvy does not depend entirely upon the want of fresh vegetables, for it appears among people whose diet is almost entirely vegetable, but who suffer from destitution and live in cold, damp dwellings, as is the case in the northern countries of Europe, especially Russia.

Triplets and Plural Births.

Dr. H. H. Darr, of Hearne, Texas, reported to the Texas State Medical Association a case of triplets, and remarks on the subject of multiple births—

"The cause of plural births is shrouded in mystery. There appears to be a hereditary influence in some families. Certain seasons seem more fruitful than others. Some localities appear to be more likely to have twin pregnancies than others. The first pregnancy appears more likely to be a multiple pregnancy. 'Newly married women appear more likely to have twins the older they are.' I think multiple pregnancy is more likely to occur in the colored than the white race."

Electricity in Chronic Diseases of the Stomach.

Among the subjects discussed in the Medical section of the German Association, at its last meeting, was "Faradization of the Stomach in cases of Dilatation and Catarrh of the Stomach." The method employed consists in introducing one insulated electrode, which is attached to the tube of the stomach pump, into the stomach, and applying the other electrode to any part of the body. Though it is very doubtful whether, in this case, the walls of the stomach really contract, yet both Kussmaul and Ziemssen expressed themselves in high terms as to the benefit derived from the methodical application of electricity in such cases.

Medical Use of Iodoform.

In the *Med. Central Zeitung*, September 13, Dr. Lindeman makes the important observation that balsam of Peru entirely conceals the odor of iodoform. Two parts of the balsam to one of iodoform are sufficient. In making an ointment or fluid application the iodoform should first be rubbed up with the balsam and the vehicle added. This latter, for an ointment, may be ung. petrolei; for a fluid preparation, glycerine or collodion, or alcohol. As—

℞.	Iodoformi,	ʒj	
	Balsami Peruviani,	ʒij	
	Unguenti petrolei,	ʒj.	M.

For an ointment.

Correspondence.

A Case of Laceration of the Cervix Uteri.

Ed. Med. and Surg. Reporter:—

The following case has sufficient of interest to merit preserving:—

Mrs. M., aged thirty-two, consulted me in June last. She was menstruating at the time, and suffering very severe bearing-down pains. The flow was in excess of a proper quantity. She was put to bed, and a large douche of hot water was administered; these douches were kept up, with a few doses of morphia, until the flow subsided. She was confined two years before, and had never been well since. She was *changing* at intervals of sixteen or eighteen days, losing too much blood, and suffering from tenesmus or colic at every change. She had leucorrhœa, backache, pain in the left groin, and was very nervous. I put her uterus, which was retroverted, in position, and cradled it with a double-lever pessary. On the left side of the cervix was a well defined laceration, and the lips of the external os were red and engorged. The hot douches were continued twice a day and the cervix painted with tincture of iodine, at intervals of five days. She took tonics and laxatives until September 23d, when I performed Emmet's operation; four silver sutures were introduced, and the laceration, first carefully denuded, was closed. The sutures were removed on the tenth day; healing was complete, and a few days afterward she went home. All her pain has vanished; she has no more colic or tenesmus; she menstruates at intervals of twenty-eight days, is free from leucorrhœa, and is doing her own work. Her nervous symptoms are gradually disappearing, and she affirms that she begins to feel as she did before her confinement, thirty months ago. She has a slight laceration of the perineum, which she declined to have closed. Ether was administered by Dr. Lippincott and the speculum was held by my nurse.

R. Stansbury Sutton, M.D.,

Pittsburg, Pa.

News and Miscellany.

Roots and Herbs.

The gathering of roots and herbs for medical purposes employs many men, women and children, in the mountainous regions of West Virginia and Kentucky. The reporter of a Cincinnati paper recently interviewed an herb gatherer who brought his products to that city for sale. Ginseng brings to the gatherer $1.00 per pound. It is mostly shipped to China. Indian arrow or wahoo root is used as an antiperiodic, and fetches 10 cents a pound; podophyllum root, 3 cents a pound; prickly ash, used in rheumatism, 6 cents a pound; sarsaparilla root, a "blood purifier," 5 cents a pound; burdock root, for the same purpose, 4 cents a pound; elecampane root, an expectorant, 10 cents a pound; but we quote from the native language of the "yarb digger" himself:—

"Yaller root, which is also known as 'golden seal,' is worth seven cents a pound. It is used fur makin' washes fur sore eyes an' mouth. Burwane root is used in makin' ager medicine; it's hard to git and brings 8 cents a pound. Butternut bark brings as high as 3 and 4 cents; that's what yer physicin' pills is made of; jist bile it down till it gits thick, like a paste, and then roll it into yer pills; it is also used for dyeing purposes. Hoarhound is used in makin' cough syrup; it brings 8 cents a pound, although it is plentiful; some places it grows so thick yer can mow it with a scythe. Another herb is lobelia, and I git 10 cents a pound fur it, but the price is falling. If yer ever want to git rid of what's inside of yer, jist make a tea of lobelia leaves, and I'll bet my team of hosses out there it'll accomodate yer. I brought in a good many Indian turnips this fall and got 8 cents a pound fur 'em; They are used in cough medicines. Silkweed root is used in ager medicine, but it is scarce in my part of the country; it is worth 10 cents a pound. Pennyroyal and peppermint brings 10 cents a pound, but when dry it takes a heap to make a pound. There are a good many kinds of bark used. There's white oak bark, best thing in the world to check the bowels, where it is made into a syrup. Yellow poplar bark used with wild cherry bark, prickly ash, dogwood bark and wahoo, is good for the consumption. Slippery elm bark is ground up and used for poultices; good to take out fever; it's worth 10 cents a pound. Then there's elder bark; take it, beeswax, mutton taller, and a leetle rosin, and it makes the best kind of a salve for fresh cuts. Boneset is an herb that grows about three feet high, with leaves of a milky color; it generally grows in old pastures; it is used for colds, and is worth 6 cents a pound. Old field balsam looks a good deal like boneset, only it don't grow so high; it is used for the same purpose. I've sold lots of catnip to these druggists, but what it is used for, more than ter nourish babies with, I don't know. I sell these fellows here all sorts of roots and herbs, even to mullin and plantain leaves, which they make salve out of. Why, even these old gympsum weeds bring 3 cents a pound, and even sunflower seeds. Why, a couple of years ago I sold two bushels of sunflower seeds fur $21. They buy pumpkin and watermelon seeds also, ter make kidney medicine out of."

Notice to Subscribers.

As the present number closes the volume and the year, subscribers will confer a particular favor by *remitting promptly* for the year 1880. We hope to welcome them all back, with many additional ones. We promise a handsome present to every old subscriber who will remit for a new one along with his own dues for the coming year.

Items.

—"Membranous croup" is prevailing in Milwaukee.

—A case of scarlet fever in a man 63 years of age is interesting Chicago physicians. It excited doubt at first, but on examination was found to be a fact. Such instances are extremely rare.

—The body of a New York merchant was cremated at Washington, Pa., last week, in the Le Moyne Crematory. There are growing indications that a respectable minority prefer having their remains thus disposed of.

—Professor Klinkerfus, of Gottingen, ridicules the notion, to which he assigns an English origin, of the danger to the earth of the present position of Jupiter, Saturn, Uranus and Neptune. He scouts the idea of the epidemics of the sixth and sixteenth centuries being caused by a similar phenomenon, declaring that such a phenomenon did not then occur, and can only occur, even excluding a Neptune, but once in 420 years.

OBITUARY NOTICE.

—Dr. Adonijah Strong died at Honesdale, Pa., Dec. 5th He was born 1800, graduated at Yale, 1820, and from the Medical College of Connecticut, in 1824. He passed his life in practice at Saulsbury and Honesdale, Pa.

MARRIAGES.

BENNETT—NOSS.—At the residence of the bride's parents, Ottawa, Kansas, on Nov. 2d, by Rev. Albert A. Bennett, of Yokohama, Japan, Dr. Howard M. Bennett, formerly of Philadelphia, and Miss Lizzie A. Noss, of Ottawa.

WEST—NICHOLSON.—In Ottumwa, Iowa, Oct. 24th, by Rev. C. B. Clark, Samuel West, M.D., and Sarah E. Nicholson, both of Eldon, Iowa.

DEATHS.

EWING.—In New York, on Thursday, December, 11th, in her 29th year, Emily Lacey, wife of Dr. W. A. Ewing.

KING.—In New York, on Sunday evening, December 7th, I. Francis King, M.D., of Wilmington, N. C.

LONGSHORE.—In Philadelphia, on the 5th inst., in his 71st year, Joseph S. Longshore, M.D.

MOLLYNEAUX.—At New Richmond, O., December 2d, after a long and painful illness, Mrs. Susan Kumler, wife of Dr. R. A. Mollyneaux, aged 41 years.

TUTHILL.—In New York, on Wednesday, the 10th inst., Beatrice, infant daughter of Dr. S. B. and Libbie Tuthill, aged 1 month and 3 days.

HORSFORD'S
Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

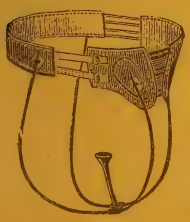
Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges.

MANUFACTURED BY THE

RUMFORD CHEMICAL WORKS,

1155-1206 PROVIDENCE, R. I.



DR. McINTOSH'S

Natural

UTERINE SUPPORTER.

No instrument has ever been placed before the medical profession which has given such universal satisfaction. The combination is such that the Physician is able to meet every indication of Uterine Displacements. Falling Womb, Anteversion, Retroversion and Flexions are overcome by this instrument, where others fail; this is proven by the fact that since its introduction to the Profession it has come into more general use than all other instruments combined.

Among the many reasons which recommend this Supporter to the Physician is its self-adjusting qualities. The Physician after applying it need have no fear that he will be called in haste to remove or readjust it, as is often the case with rings and various pessaries held in position by pressure against the vaginal wall, as the patient can remove it at will and replace it without assistance.

The Abdominal Supporter is a broad morocco leather belt, with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen. The Uterine Support is a cup and stem made of highly polished hard rubber, very light and durable, shaped to fit the neck of the womb, with openings for the secretions to pass out; as shown by the cuts. Cups are made with extended lips, to correct flexions and versions of the womb.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, passing down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic adapt themselves to all the varying positions of the body, and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Anteversion, Retroversions, or any Flexions of the Womb, and is used by the leading Physicians with never failing success, even in the most difficult cases.

Price—to Physicians, $8.00; to Patients, $12.00

Instruments sent by mail, at our risk, on receipt of price with 16 cents added for postage, or by Express, C. O. D.

DR. McINTOSH'S NATURAL UTERINE SUPPORTER CO.,
192 JACKSON STREET, CHICAGO, ILL.

Our valuable pamphlet "Some Practical Facts about Displacements of the Womb," will be sent you free on application.

NEW REMEDIES.

FLUID EXTRACTS.

Coto Bark.—From BOLIVIA. Almost a specific in acute and chronic diarrhœa, cholera, cholera morbus, etc.

Cascara Sagrada.—(**Rhamnus Purshiana.**) From the PACIFIC SLOPE. A certain remedy for habitual constipation; and very useful in all cases where a laxative or cathartic is indicated. Beware of the fluid extracts of spurious varieties of this bark.

Folia Carobæ.—From BRAZIL. A powerful alterative, which exerts a marked curative action in syphilis, scrofula and kindred diserders.

Rhus Aromatica.—A remedy in diabetes, and other diseases of the genito-urinary organs.

Damiana.—(**Turnera Aphrodisiaca.**) From MEXICO. The best known aphrodisiac. Of great value in impotence, spermatorrhœa, and loss of sexual appetite.

Boldo.—(**Peumus Boldo.**) From CHILI. The new tonic. Very useful in dyspepsia, hepatic torpor, yellow fever, etc.

Berberis Aquifolium.—From CALIFORNIA. Has marked alterative and tonic powers, and has been used with extraordinary success in salt rheum, psoriasis, eczema, scrofula and syphilis.

Black Haw.—(**Viburnum Prunifolium.**) From the UNITED STATES. Employed to prevent abortion and miscarriage.

Grindelia Robusta.—From CALIFORNIA. A valuable curative agent in asthma and diseases of the air passages.

Grindelia Squarrosa.—From CALIFORNIA. Anti-malarial. Used in enlarged spleen and other malarial diseases.

Cereus Bonplandii.—(**Cereus Grandiflorus and Cereus McDonaldii.**) From MEXICO. Heart sedatives. Very useful in controlling functional and organic disturbances of the heart.

Kaki.—(**Diospyros Kaki.**) From JAPAN. Peculiar action on the mucous surfaces. Useful in mucous dyspepsia, typhoid fever, etc.

Cercis Canadensis.—Indigenous. A positive remedy in chronic diarrhœa, dysentery, etc.

Jaborandi (diaphoretic). **Guarana** (sick headache). **Fucus Vesiculosus** (anti-fat).
Bearsfoot (enlarged spleen). **Coca** (nervous stimulant). **Kava Kava** (Gonorrhœa).
Eucalyptus Globulus (antiseptic and anti-malarial). **Yerba Santa** (coughs).
Yerba Reuma (catarrh). **Wood Betony** (dyspepsia). **Ustilago Maidis** (oxytocic).
Penthorum Sedoides (catarrh). **Soap Tree Bark** (tooth wash).

CRUDE DRUGS.

Goa Powder (ringworm and diseases of the skin). **Gurjun Balsam** (a substitute for Copaiba).
Alstonia Constricta (a substitute for Calisaya).

SUGAR-COATED GRANULES.

Calcium Sulphide 1-10 gr. (for the cure of boils and carbuncles).

Our limited space prevents our describing in detail the history and application of each remedy, but to those interested in NEW REMEDIES, we will say, that we can furnish interesting information relative to the above new drugs.

PARKE, DAVIS & CO.,

DETROIT, - MICHIGAN.

Our New Remedies can be procured of the Drug Trade throughout the United States. By specifying **"P., D. & Co.'s"** in all cases, you will ensure reliable preparations of the **true drugs.**

BE CAREFUL TO SPECIFY McKESSON & ROBBINS'.

SPECIFY McKESSON & ROBBINS' Oval Shape, Complete Coating.

IMPORTANT TO PHYSICIANS!

The fact that Sulphate of Quinine is only soluble in over 700 parts of water is not generally known, or if known is not usually considered, except in prescriptions, when this difficulty is overcome by the addition of Acid; and the further fact that **Bi-Sulphate of Quinine** is soluble in **only 10 parts of water** is as little appreciated.

McKesson & Robbins have paid much attention to the subject of putting Quinine into Pills, in a condition approaching that of a solution, and have at last succeeded in their **BI-SULPHATE OF QUININE PILLS,** and offer the same to the profession, confident that they will stand any test for solubility and prompt action. Physicians will please always specify **McK. & R. Bi-Sulph. Quinine Pills,** and they will not be disappointed in results.

Note.--With no reference to *respectable* druggists, we would say that cases have come to our knowledge and have been noted, where other pills have been substituted on prescriptions for ours.

POWDERED PURIFIED CHINOIDINE.

Containing all the Non-Crystalizable Alkaloids of Cinchona Bark.

Similar preparations have been lately offered in market AT HIGH PRICES under different fancy appellations, and claims made for the same as of equal efficiency with Quinine.

As a great demand exists for a cheap anti-malarial remedy, we introduce this preparation at low figures; and, in order that the profession may judge practically of its merits, will forward a sample to any physician's address, or mail one ounce upon receipt of FIFTY CENTS.

Yours respectfully,

McKESSON & ROBBINS,

Wholesale Druggists and Manufacturing Chemists,

91 FULTON ST., NEW YORK.

GRANULATED EFFERVESCENT SALTS

PREPARED BY

WILLIAM R. WARNER & Co.,

CHEMISTS,

PHILADELPHIA.

Granulated Effervescent

VICHY SALT.

(Grand Grille.)

A large teaspoonful dissolved in half a glass of water, forms a grateful and refreshing draught, identical with the natural water. Per dozen, $4.00

Granulated Effervescent

SELTZER SALT.

A tablespoonful to half a glass of water forms a grateful and refreshing saline draught, identical with the natural water. Per Dozen, $4.00

Granulated Effervescent

SEIDLITZ MIXTURE.

(Seidlitz Powder, U. S. P.)

An excellent aperient and refrigerant, very acceptable to the stomach. Per doz. $4.00

DOSE.—One tablespoonful in a glass of water.

Granulated Effervescent

NITRATE of POTASSIUM.

A dessert-spoonful in glass of water makes an excellent mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

CITRATE OF POTASSIUM.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $5.00

Granulated Effervescent

Bi-Carbonate of Potassium.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

Pepsin, Bismuth and Strychnia.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin, soluble Citrate of Bismuth, and the sixtieth grain of Citrate of Strychnia. Per dozen, $10.00

Granulated Effervescent

PEPSIN AND BISMUTH.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin and soluble Citrate of Bismuth. Per doz. $9.00

Granulated Effervescent

CITRATE OF MAGNESIA.

(Pleasant and Efficient.)

For a purgative effect, take two or more tablespoonfuls added to a small glass of water, and drink while effervescing. As a laxative, one or more tablespoonfuls taken in the same manner. One or two teaspoonfuls in sweetened water, produces a delightful, cooling drink in summer. Per dozen, $4.00

Granulated Effervescent

CITRATE LITHIA.

Each drachm or teaspoonful contains four grains of the chemically pure salt. Valuable in Rheumatic, Gouty and Analogous disorders. Per dozen, $10.00

Granulated Effervescent

KISSINGEN SALT.

A large teaspoonful dissolved in half a glass of water, forms an agreeable and refreshing draught identical with the natural water. Per dozen, $4.00

Granulated Effervescent

CRAB ORCHARD SALT.

Prepared from the exact analysis of the purified natural salt, obtained from the Crab Orchard Spring, Ky.

A tablespoonful in half a glass of water forms a grateful effervescing draught, producing the effect of the natural water. Per dozen, $4.00

Granulated Effervescent

OXALATE OF CERIUM.

Each drachm or large teaspoonful contains two grains of Oxalate of Cerium. Per dozen, $5.00

Granulated Effervescent

CITRATE CAFFEINE.

A dessert-spoonful containing one grain of Citrate of Caffeine should be given for sick headache, every hour or two before and during the paroxysms. Per dozen, $10.00

Physicians will please specify Warner & Co.—Equal to best English.

FLUID EXTRACT COCA.

NERVINE, STIMULANT.

USED IN PERU AND BOLIVIA AS A MASTICATORY.

This Extract contains the entire properties of the leaf of the **Erythroxylon Coca.**

COCA WINE.

This wine has been successfully used in France as a **Tonic,** and found very desirable where a more mild effect of the Coca than the Fluid Extract was desired.

FLUID EXTRACT OF FUCUS VESICULOSUS

(BLADDER WRACK).

SUCCESSFULLY USED FOR THE REDUCTION OF OBESITY.

It seems to have no appreciable effect on the general health other than the removal of the adipose tissue.

The above Extracts have been prepared by us, and special care given that their medical properties be not impaired.

FLUID EXTRACT OF VISCUM ALBUM.

THE NEW SUBSTITUTE FOR ERGOT.

PROF. LISTER'S ANTISEPTIC DRESSING,

PREPARED BY US.

We also have direct from Edinburgh Professor Lister's entire Antiseptic Dressing, consisting of Antiseptic Gauze, Mackintosh Cloth, Protection Silk, Carbolized Ligatures, and Spray Producers for Dr. Lister's Method.

CASWELL, HAZARD & CO.,

NEW YORK.

APOLLINARIS WATER.

HIGHLY EFFERVESCENT.

Approved by the Academy of Medicine of France, and its Sale in France as a Natural Mineral Water authorized by Special Decree of the French Government.

"The Exquisite Apollinaris."—Dr. J. Milner Fothergill. "Queen of Table Waters."—Lon. Med. Record.

APOLLINARIS WATER has been the subject of the most favorable reports from Professors Fordyce Barker, Ogden Doremus, Austin Flint, W. A. Hammond, Loomis, F. N. Otis, E. R. Peaslee, Sayre, Marion Sims, James R. Wood, New York, etc., etc.

APOLLINARIS	Used habitually as a table water, its pleasant taste and richness in pure carbonic acid favorably distinguish it from the other similar mineral waters.—Prof. Dr. VIRCHOW, *Member of the German Parliament, and Professor University of Berlin.*
APOLLINARIS	EXCEPTIONALLY VALUABLE and PLEASANT as a table-water in HYGIENIC as well as DIETETIC respects; maintains its FRESHNESS on the PALATE when constantly used.—Prof. Dr. OSCAR LIEBREICH, Berlin.
APOLLINARIS	I have for many years always obtained the best success with this water in cases of severe DISORDERS of the DIGESTION; in PHTHISIS, during CONVALESCENCE from severe ILLNESSES, after TYPHUS PNEUMONIA, ARTICULAR RHEUMATISM, and also in DIPHTHERIA, and in the various other diseases in which it was necessary to produce a TONIC EFFECT upon the STOMACH and the DIGESTION. I have of late almost EXCLUSIVELY EMPLOYED IT.—Prof. Dr. OERTEL, Munich, *Author of Treatise on Diphtheria, &c., Ziemssen's Cyclopædia.*
APOLLINARIS	REFRESHING, PROMOTES DIGESTION, and is especially to be recommended as an adjuvant in the following morbid conditions: DYSPEPSIA characterized by ACIDITY of the STOMACH, GASTRO-ENTERALGIA, tendency to GALL-STONES, GOUTY conditions, CATARRHAL affections of the GENITO-URINARY MUCOUS MEMBRANE, and UTERINE CONGESTION leading to CATAMENIAL HEMORRHAGE. The habit of drinking Apollinaris Water has SAVED many from TYPHOID Fever, while their COMPANIONS drinking COMMON WATER were INFECTED.—Dr. HERMANN WEBER, *Fellow of the Royal College of Physicians, London, &c., &c.*

Further Testimonials from numerous authorities, including Professors Frankland, F.R.S., Lond.; Odling, F.R.S., Oxford; A. W. Hoffmann, F.R.S., Privy Councillor, Berlin; Kekulé, Rector of University of Bonn; Professors Ditterich, Munich; Nussbaum, Munich; Varrentrapp, Frankfort; T. K. Chambers, Physician to the Prince of Wales; Peter Hood, M.D.; Peter Squire, F.L.S., Chemist to the Queen, and others; Professors Drs. Labbé, Fauvel, A. Latour, L. Championnière, Constantin James, Lutaud, &c., France, and many others, have been published and may be obtained on application to

F. DE BARY & CO., 41 & 43 Warren St., New York.

Apollinaris Water may be had of all Wine Merchants, Grocers, Druggists, and Mineral Water dealers throughout the United States.

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION,

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil, by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM, instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

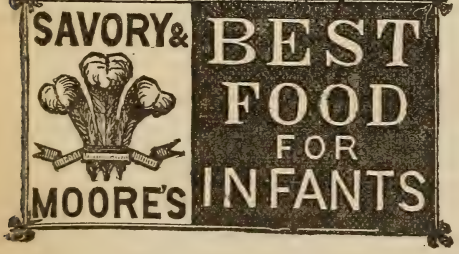
Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat, in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more digestible solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatized Cod-Liver Oil, the active digestive principle of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Pancreatine effects the digestion and assimilation of Cod-Liver Oil and Fat, as well as Food generally. This palatable and popular remedy is therefore invaluable to PATIENTS WHO ARE UNABLE TO DIGEST COD-LIVER OIL, and who are thus deprived of its nourishing and invigorating properties.

Pancreatine Wine. An excellent vehicle for taking Cod-Liver Oil and promoting the digestion of it.



Tins, 1*s*, 2*s*, 5*s*, 10*s*.

NEW HYPODERMIC SYRINGES.

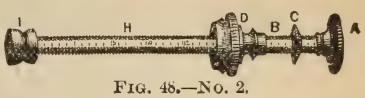

FIG. 48.—No. 2.

These cuts (two-thirds the actual size) represent a New Hypodermic Syringe of our Manufacture. With the exception of the needles, it is of German Silver, a material chosen as possessing, next to steel, the greatest rigidity and durability, while free from liability to oxydation. The barrel is formed by a process peculiar to ourselves, securing uniformity of calibre without soldered joint or seam. It is plated inside and outside with nickel. The piston is packed in the double parachute form, with leather prepared expressly for the purpose. It will be found to retain its elasticity, to operate smoothly, to resist all tendency of fluid to pass above, as of air below it. A nicely-engraved scale upon the piston-rod indicates minims, thirty being the capacity of the syringe.

Syringes Nos. 2, 3, and 4 have also a screw thread upon the piston-rod, and a traverse nut, thereby favoring the utmost nicety in the graduation of doses.

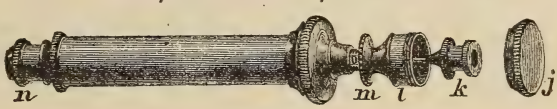
No. 3, Compact, has hollow piston-rod to receive one needle, also a protecting cover and fluid retainer; it may be carried in the Pocket Instrument or Vial Case, or without any case.

No. 4, Compact, is like No. 3, with the addition of a second needle, carried upon the syringe in the usual place, protected by a metal shield.

Nos. 1 and 2 are put up in neat morocco-covered case, with vial.

Two sizes of needles are furnished with each instrument, Nos. 1, 2, and 4; one only with No. 3. They are of refined steel, carefully tempered, and thoroughly plated with gold; they are of small diameter and large relative calibre, sharpened to such an angle as will offer least resistance to penetration, and therefore cause least pain. At the point of union with the socket they are reinforced with an outer covering of German silver, thereby overcoming the tendency to become broken at this place. They are connected with the barrels by a screw thread.

Prices: No. 1, *$3 50* No. 2, *$4.00* Postage, .03
" No. 3, *2.50* No. 4, *3.50* " .02



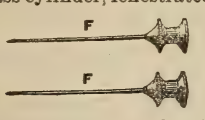
No. 3.

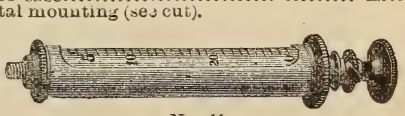
These Syringes are so thoroughly and strongly made as to be free from the annoying accidents common to most Hypodermic Syringes; and we believe that, for convenience, durability, and nicety of construction, they have no superior.

OTHER HYPODERMIC SYRINGES.

		Postage.
No. 7, glass-barrel, graduation engraved on barrel, with screw nut on piston, nickel-plated mountings, two best steel gilt needles, in neat case	*$3.00*	.02
No. 9, glass, graduation engraved and numbered on piston-rod, with screw nut, best steel gilt needles, in neat case	*3.00*	.02
No. 7 or No. 9, with two steel unplated needles, either	*2.50*	.02
No. 10, glass, Luer's (French), graduation as No. 9, one gold needle and two steel needles, silver mountings, neat velvet-lined morocco case	*12.00*	.02

No. 11, glass cylinder, fenestrated, nickel plated metal mounting (see cut).





No. 11.

As represented in the cut, the glass cylinder is encased in a metal mounting, fenestrated to show the graduations for minims. The instrument may readily be taken apart for cleaning, and for those who prefer glass, is recommended for its non-liability to breakage. Price, with two best steel gilt needles, in a neat case..... *$3.50* Postage. .02

☞ *Any of the above will be sent by return mail on receipt of Price and Postage.* ☜

HYPODERMIC SYRINGES OF ALL KINDS PROMPTLY REPAIRED.

CODMAN & SHURTLEFF,

Makers and Importers of Superior Surgical Instruments,

1140-1191eow **13 & 15 TREMONT STREET, BOSTON, MASS.**

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt. and all its combinations.

Extract of Malt,

WITH COD-LIVER OIL,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO,

(See Transactions of American Medical Association, for 1876, page 176.)

Is presented to the medical profession as an efficient, palatable and very stable combination, consisting of equal parts of the ***Extract of Canadian Barley Malt*** and the best quality of genuine ***Norwegian Cod-liver Oil.*** Many patients take this preparation who cannot take the oil in any other form. It may be employed in all cases where Cod-liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

Extract of Malt,

WITH COD-LIVER OIL AND PHOSPHORUS,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod-liver Oil, Phosphorus being added in the proportion of $\frac{1}{100}$ grain to the dose, and so combined as to be perfectly protected from oxidation. The ***Trommer Extract of Malt Company*** prepare this combination agreeably to the suggestion of ***Dr. Wilson Fox.*** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

Extract of Malt,

WITH COD-LIVER OIL AND IODIDE OF IRON

added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod-liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians, referring to it in terms of high praise.

1090-1115eow

BARON LEIBIG, the greatest authority on Infant Diet, states that the majority of children who die under one year of age, do so from the effects of improper food, or from the improper administration of the food.

HORLICK'S FOOD.

A Concentrated Extract, prepared according to the Formula of Baron Liebig, and, unlike other Foods,

IS NOT FARINACEOUS.

It is acknowledged by Physicians to be the best Food

For Infants, Dyspeptics and Invalids.

Prof. J. Lewis Smith Says,

Speaking of **HORLICK'S FOOD:** "Being carefully prepared, according to Liebig's Formula, by Chemists fully competent, it possesses certain advantages, such as quick and easy preparation and a pleasant flavor, and is therefore highly esteemed by those who have used it." [*Page 58 of the fourth edition of a Treatise on Diseases of Infancy and Childhood. By J. Lewis Smith, M. D., etc.*—1879] Also, speaking in another place [page 647] of artificial food for infants, especially those suffering from intestinal catarrh, he says: "I prefer Liebig's, especially **HORLICK'S** preparation of it."

Report from Bellevue Hospital, New York.

In *The Hospital Gazette* for February 6th. 1879 [page 108] Dr. E. Hochheimer makes a report from BELLEVUE HOSPITAL of a case of Infantile Paralysis, which was followed by an exhausting diarrhœa—Speaking of the treatment, he says: "Her condition continued unchanged for the next three weeks; she was put upon a diet consisting principally of milk, but the diarrhœa persisted in spite of opiates and astringents."

"*Nov. 17th.—Milk was stopped, and she was put upon a diet of HORLICK'S FOOD; after this she began to mend, the diarrhœa became less and finally disappeared; she began to gain flesh, and her general condition was much improved.*"

We also beg to refer, by permission, to the following eminent medical men, who have used our Food extensively in their practice :— **Prof. DeLaskie Miller,** (Rush Medical College); **Prof. Wm. H. Byford,** (Chicago Medical College); **Prof. J. Adams Allen,** (Rush Medical College); **Drs. J. P. Oliver** and **C. P. Putnam,** (Harvard Medical School); **Prof. Gawne,** (Cleveland Medical College); and several hundred others whose testimonial letters are on file in our office.

PRICE, 75 Cents per bottle. Trial Size, 40 Cents.

1166-1217

TO THE MEDICAL PROFESSION.

LACTOPEPTINE,

The most important remedial agent ever presented to the Profession for Indigestion, Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all diseases arising from Imperfect Nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase, or Veg. Ptyalin, Lactic and Hydrochloric Acids, in Combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk.....40 ounces.	Veg. Ptyalin or Diastase.....4 drachms.
Pepsin.....8 ounces.	Lactic Acid.....5 fl. drachms.
Pancreatine.....6 ounces.	Hydrochloric Acid.....5 fl. drachms.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its almost universal adoption by the Profession is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned having tested LACTOPEPTINE, recommend it to the Profession:—

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

LEWIS A. SAYRE, M.D.,
Professor of Orthopædic Surgery and Clinical Surgery, Bellevue Hospital Medical College.

F. LE ROY SATTERLEE, M.D., PH.D.,
Professor of Chem., Mat. Med. and Therap. in the N. Y. College of Dent.; Prof. of Chem. and Hygiene in the Am. Vet. College, etc., etc.

SAMUEL R. PERCY, M.D.,
Professor Materia Medica, New York Medical College.

A. VAN DEVEER, M.D.,
ALBANY, N. Y., June 8th, 1878.
Prof. of the Prin. and Prac. of Surg., Albany Med. Col.: Surg. Albany and St. Peter's Hospitals.
"I have given LACTOPEPTINE a good thorough trial, and have been greatly pleased with the excellent results that have followed its administration."

JOHN H. PACKARD, M.D.,
PHILADELPHIA, PA., May 30th, 1878.
Pres't Phila. Co. Obstet. Society; Surg. Episcopal and Women's Hospitals.
"I have found great satisfaction in the use of LACTOPEPTINE, and have ordered it frequently in cases of Dyspepsia, especially where there is want of tone and defective secretion."

JAS. AITKEN MEIGS, M.D.,
PHILADELPHIA, June 20th, 1878.
Prof. of the Institutes of Med. and Med. Juris., Jeff. Medical College; Phy. to Penn. Hos.
"I have used LACTOPEPTINE with very good effect in a number of cases of Dyspepsia."

W. W. DAWSON, M.D.,
CINCINNATI, O., June 21st, 1878.
Prof. Prin. and Prac. Surg., Med. Col. of Ohio; Surg. to Good Samaritan Hospital.
"I have used LACTOPEPTINE with great advantage in cases of feeble digestion."

ALBERT F. A. KING, M.D.,
WASHINGTON, D. C., June 19th, 1878.
Prof. of Obstetrics, University of Vermont.
"I have used LACTOPEPTINE both in hospital and private practice, and have found it to answer fully the purposes for which it is recommended. As an immediate aid to the digestive function, I know of no remedy which acts more directly."

D. W. YANDELL, M.D.,
LOUISVILLE, KY., March 7th, 1878.
Prof. of the Science and Art of Surg. and Clinical Surg., University of Louisville.
"I have made much use of LACTOPEPTINE, and take great pleasure in stating that it has rarely disappointed me. I shall, of course, continue to prescribe it."

ROBT. BATTEY, M.D.,
ROME, GA., June 8th, 1878.
Emeritus Prof. of Obstetrics, Atlanta Med. College, and Ex-Pres. Med. Association of Ga.
"I have used LACTOPEPTINE in a case of Dyspepsia with satisfaction. I think well of it."

CLAUDE H. MASTIN, M.D., LL.D.,
MOBILE, ALA., June 8th, 1878.
"I consider LACTOPEPTINE the very best preparation of the kind which I have ever employed, and for patients with feeble digestion I know of nothing that is equal to it."

Prof. H. C. BARTLETT, PH.D., F.C.S.,
LONDON, ENG., February 22d, 1876.
"I find the preparation of LACTOPEPTINE contains within itself all the principles required to promote a healthy digestion.

PRICE LIST.

LACTOPEPTINE (in oz. bottles).....per oz. $1.00
" (" ").....per doz. 10.00
" (in ½ lb ").....per lb. 12.00

We also prepare the various Elixirs and Syrups, in combination with Lactopeptine.

L. REICH,

DIRECT IMPORTER OF THE CHOICEST AND PUREST

Hungarian WINES

EVER BROUGHT TO THIS COUNTRY,

STRICTLY FOR MEDICINAL USE.

13 West 11th St., New York.

Mr. REICH will be pleased to see those of the Medical Profession who may desire to avail themselves of the opportunity of procuring **STRICTLY FIRST-CLASS WINES**, which have received the endorsement of the most eminent Medical men of the country, as is evidenced from the following letters of commendation which have been received:—

This is to certify, that I have examined Mr. L. REICH'S TOKAYER AUSBRUCH, TOKAYER MASLAS and BUDAI IMP. I take great pleasure in commending these Wines to the Medical Profession because of their purity.

R. OGDEN DOREMUS, M.D., LL.D.,
Prof. of Chem. and Toxicology in Bellevue Hosp. Med. Col., and Prof. of Chem. and Physics in Col. City of New York.

We have used in our practice the Hungarian Wines sold by Mr. LORENZ REICH, who puts them on the market unadulterated, just as they are imported. To this fact we attribute their great value as a medicine in diseases where such tonics are indicated, especially in those which are attended by defective digestion and imperfect assimilation. We cordially recommend Mr. REICH and his Wines to our professional brethren.

J. MARION SIMS, M.D.,
Late Surgeon to the Woman's Hospital, N. Y.

ALFRED L. LOOMIS, M.D.,
Prof. of Pathology and Practice of Medicine, University of City of New York.

F. LEROY SATTERLEE, M.D., PH.D.,
Prof. of Chemistry, Materia Medica and Therapeutics, in the New York College of Dentistry.

BOYLSTON MEDICAL PRIZE QUESTIONS.

The Boylston Medical Committee, appointed by the President and Fellows of Harvard University, consists of the following physicians:—

D. H. Storer, M.D.	Richard M. Hodges, M.D.
Morrill Wyman, M.D.	Calvin Ellis, M.D.
Henry J. Bigelow, M.D.	Samuel Cabot, M.D.

At the annual meeting, held June 9th, 1879, it was voted that no dissertation worthy of a prize had been offered on either of the subjects proposed for 1879.

The following are the questions proposed for 1880:—

I. Antiseptic Treatment. What are its essential details. How are they best carried out in practical form?

II. Diphtheria. Its causes diagnosis and treatment.

The author of a dissertation considered worthy of a prize, on either of the subjects proposed for 1880, will be entitled to a premium of One Hundred and Fifty Dollars.

Dissertations on the above subjects must be transmitted, postpaid, to D. H. Storer, M.D., 182 Bolyston St., Boston, *on or before the first Wednesday in April*, 1880.

The following are the questions proposed for 1881:—

I. The Effects of Drugs, during Lactation, on either nurse or nurseling.

II. Injuries to the Back, without apparent mechanical lesion, in their surgical and medico-legal aspects.

The author of a dissertation considered worthy of a prize, on either of the subjects proposed for 1881, will be entitled to a premium of Three Hundred Dollars.

Dissertations on these subjects must be transmitted as above, on or before the first Wednesday in April, 1881.

Each dissertation must be accompanied by a sealed packet, on which shall be written some device or sentence, and within which shall be inclosed the author's name and residence. The same device or sentence is to be written on the dissertation to which the packet is attached.

The writer of each dissertation is expected to transmit his communication to the President of the Committee, D. H. Storer, M.D., in a distinct and plain handwriting, *and with the pages bound in book form*, within the time specified.

Any clew by which the authorship of a dissertation is made known to the Committee will debar such dissertation from competition.

Preference will be given to dissertations which exhibit original work.

All unsuccessful dissertations are deposited with the Secretary, from whom they may be obtained, with the sealed packet unopened, if called for within one year after they have been received.

By an order adopted in 1826, the Secretary was directed to publish annually the following votes:—

1st. That the Board do not consider themselves as approving the doctrines contained in any of the dissertations to which premiums may be adjudged.

2d. That in case of publication of a successful dissertation, the author be considered as bound to print the above vote in connection therewith.

RICHARD M. HODGES, M.D., *Sec'y*,
BOSTON, MASS.

BETHESDA WATER.

BELLEVUE, PA., May 21st, 1879.

W. B. HYATT, M.D.,
Marshallville, Wayne Co., Ohio.

DEAR SIR:—Your letter received this morning. Am sorry my friend Dr. S. did not think to tell you to address me at Pittsburg, and your communication would have reached me in a few hours instead of days, as I seldom call at the village P. O.

You will address your orders for BETHESDA WATER to JOSEPH FLEMING, 84 Market Street, Pittsburg, Pa., and they will receive prompt attention. I say this on account of my business acquaintance with Mr. Fleming. I will call on him in the morning, and have him send you pamphlets and any information relative to the matter he may think required.

If my testimony regarding the efficacy of Bethesda Water was required, I could cite several cases of my own personal knowledge. I am convinced that it is a specific in diseases arising from a morbid condition of the kidneys, providing, of course, that the disease has not reached a point beyond the possibility of recovery, as in the case of my late brother, and even then no figures could estimate its value in giving relief from suffering. I have a friend who was under treatment of different physicians all last fall and winter, and apparently getting worse: I persuaded him to stop the treatment and use the "water," and before he had used ten (10) gallons he was much better, and now nearly if not quite well. The doctors would diagnose Phlebitis, but there was a low specific gravity of the urine and other indications of kidney or dropsical affection, which satisfied me that he needed the effects of the "water;" and the results are as stated, and the inflamed vein is getting well, as well as general improved health. It occurs to me, the duty of physicians to investigate such things, and if they contain medicinal virtues, to make it known to suffering humanity instead of standing aloof until men in other walks of life have long recognized and demanded its use. Of course, there are so many new remedies claimed that are worthless, that there is some excuse, yet this Bethesda Water has been in use more than ten (10) years, and comparatively few physicians appear to know anything about its properties. Although you are a stranger to me, allow me to commend you, or any worthy physician who is willing to investigate and test its claimed virtues, and if found, to disseminate the knowledge among their less fortunate fellows. Yours, truly,

W. J. THOMPSON.

P. S.—If you have occasion to address me further, send your letter to Auditor's Office, P. A. R. R., Pittsburg, Pa.

Sole Agent for this Water, for the States of Pennsylvania, Indiana, Ohio, Virginia, West Virginia, New Jersey, Delaware and Maryland—

JOSEPH FLEMING,
WHOLESALE AND RETAIL DRUGGIST,

DR. McINTOSH'S

Natural

UTERINE SUPPORTER.

No instrument has ever been placed before the medical profession which has given such universal satisfaction. The combination is such that the Physician is able to meet every indication of Uterine Displacements. Falling Womb, Anteversion, Retroversion and Flexions are overcome by this instrument, where others fail; this is proven by the fact that since its introduction to the Profession it has come into more general use than all other instruments combined.

Among the many reasons which recommend this Supporter to the Physician is its self-adjusting qualities. The Physician after applying it need have no fear that he will be called in haste to remove or readjust it, as is often the case with rings and various pessaries held in position by pressure against the vaginal wall, as the patient can remove it at will and replace it without assistance.

The Abdominal Supporter is a broad morocco leather belt, with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen. The Uterine Support is a cup and stem made of highly polished hard rubber, very light and durable, shaped to fit the neck of the womb, with openings for the secretions to pass out; as shown by the cuts. Cups are made with extended lips, to correct flexions and versions of the womb.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, passing down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic adapt themselves to all the varying positions of the body, and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Anteversion, Retroversions, or any Flexions of the Womb, and is used by the leading Physicians with never failing success, even in the most difficult cases.

Price—to Physicians, $8.00; to Patients, $12.00

Instruments sent by mail, at our risk, on receipt of price with 16 cents added for postage, or by Express, C. O. D.

DR. McINTOSH'S NATURAL UTERINE SUPPORTER CO.,
192 JACKSON STREET, CHICAGO, ILL.

Our valuable pamphlet "Some Practical Facts about Displacements of the Womb," will be sent you free on application.

MIAMI MEDICAL COLLEGE OF CINCINNATI.

Member of the American Medical College Association.

FACULTY.

JOHN A. MURPHY, M.D., Professor of Principles and Practice of Medicine and Clinical Medicine.
WM. H. MUSSEY, M.D., Professor of Operative and Clinical Surgery and Surgical Diseases of Women.
E. WILLIAMS, M.D., Professor of Ophthalmology, Aural Surgery and Clinical Ophthalmology.
WM. CLENDENIN, M.D., Professor of Descriptive and Surgical Anatomy.
WM. H. TAYLOR, M.D., Professor of Obstetrics and Clinical Midwifery.
THOMAS H. KEARNEY, M.D., Professor of Principles of Surgery, Surgical Diseases and Clinical Surgery.
J. C. MACKENZIE, M.D., Professor of Physiology and Pathology and Clinical Medicine.
J. F. JUDGE, M.D., Lecturer on Chemistry and Toxicology.
WM. B. DAVIS, M.D., Professor of Materia Medica and Therapeutics.
BYRON STANTON, M.D., Professor of Diseases of Women and Children and Clinical Gnyæcology.
WM. H. DE WITT, M.D., Lecturer on Mental Diseases.
B. P. GOODE, M.D., Lecturer on Diseases of Children.
ROBT. SATTLER, M.D., Lecturer on Diseases of the Eye and Ear.
A. D. BENDER, M.D., Lecturer on Laryngoscopy and Diseases of the Throat, and Demonstrator of Anatomy.
C. A. LE BOUTILLIER, M.D., Lecturer on Surgical Dressings.
CHAS. W. MATHERS, M.D., Demonstrator of Anatomy.
WM. L. DUDLEY, Demonstrator of Chemistry.

☞ THE PRELIMINARY TERM of Lectures will begin September 3d, 1879, and continue one month. This Course will be one of *unusual interest and importance* to physicians as well as students.

THE REGULAR WINTER SESSION will begin October 1st, 1879, and continue five months. This course will consist of Didactic Lectures with Demonstrations, Recitations, Clinical and Special Instruction, involving Physical Manipulations. From five to six Didactic Lectures and Demonstrations are delivered daily, covering the general topics of Medicine and Surgery as taught in all regular medical colleges.

CLINICS.—The Faculty confidently announce that students have, in this college, unsurpassed clinical advantages. *Four Special Clinics* are held daily, in the college building (at which more than six thousand patients are examined annually), viz.: In Practice, Surgery, Gynæcology, Diseases of Children, Ophthalmology and Larnygology, in all of which advanced students have opportunities to make full examinations, especially in *Thoracic Diseases* and *Gynæcology*, and frequently to witness *Obstetric* cases. These clinics are free to students of the college. Two clinical lectures are delivered daily at the Cincinnati Hospital (near the college), during the entire college session.

The College also affords the fullest advantages in *Practical Chemistry*, *Practical Anatomy*, *Practical Physiology* and *Microscopy*.

FEES.

Matriculation fee (annually)	$ 5 00	Demonstrator's Ticket	$5 00
Regular Lecture Term	75 00	Hospital Ticket	5 00
Graduation Fee	25 00	Alumni of this institution free.	

JOHN A. MURPHY, M.D., Dean, 1160-1185 *163 West Seventh Street.*

WM. H. TAYLOR, M.D., Secretary, *329 West Seventh Street.*

JEFFERSON MEDICAL COLLEGE
PHILADELPHIA.

The Fifty-fifth Session of the Jefferson Medical College will begin on Wednesday, October 1st, 1879, and will continue until the 1st of March, 1880. Preliminary Lectures will be held from Monday, 8th of September.

PROFESSORS.

JOSEPH PANCOAST, M.D.,
General, Descriptive and Surgical Anatomy (Emeritus).

S. D. GROSS, M.D., L.L.D., D.C.L. Oxon.
Institutes and Practice of Surgery.

ELLERSLIE WALLACE, M.D.,
Obstetrics and Diseases of Women and Children.

J. M. DA COSTA, M.D.,
Practice of Medicine.

J. AITKIN MEIGS, M.D.,
Institutes of Medicine and Medical Jurisprudence.

WM. H. PANCOAST, M.D.,
General, Descriptive and Surgical Anatomy.

ROBERT E. ROGERS, M.D.,
Medical Chemistry and Toxicology.

ROBERTS BARTHOLOW, M.D.,
Materia Medica and General Therapeutics.

CLINICAL INSTRUCTION is given *daily* at the HOSPITAL OF THE JEFFERSON MEDICAL COLLEGE throughout the year, by Members of the Faculty, and by the Hospital Staff, which is constituted as follows:

Surgeons.
JOHN H. BRINTON, M.D.,
S. W. GROSS, M.D.,
R. J. LEVIS, M.D.

Ophthalmic Surgeon.
WILLIAM THOMPSON, M.D.

Aural Surgeon.
L. TURNBULL, M.D.

Physicians.
J. SOLIS-COHEN, M.D.,
JAMES C. WILSON, M.D.,
OLIVER P. REX, M.D.,
W. W. VANVALZAH, M.D.

Gynæcologists.
F. H. GETCHELL, M.D.,
J. EWING MEARS, M.D.

Pathologist.
MORRIS LONGSTRETH, M.D.

A SUMMER COURSE of Lectures is given, beginning in the third week in March, 1880, and extending through the months of April, May, and to the middle of June. There is no additional charge for this Course to matriculates of the College, except a registration fee of five dollars; non-matriculates pay thirty-five dollars, which is, however, credited on the amount of fees paid for the ensuing Winter Course.

FEES.

Matriculation Fee (paid once),	$5.00	Practical Anatomy,	$10.00
Ticket of each Professor (7) $20,	140.00	Graduation Fee,	20.00

The Annual Announcement, giving full particulars, will be sent on application to

1166-78 eow *ELLERSLIE WALLACE, Dean.*

WOMAN'S HOSPITAL MEDICAL COLLEGE
337 and 339 S. Lincoln St., Chicago.

The *Tenth Annual Course of Lectures* will commence the first Tuesday in October, 1879, and continue twenty-one weeks. The Spring Term will commence April 1st, and continue twelve weeks. College building new. Clinical and Dissecting advantages unsurpassed.

FACULTY.—William H. Byford, A.M., M.D., President, Obstetrics; T. D. Fitch, M.D., Secretary, Gynecology; Charles W. Earle, M.D., Treasurer, Diseases of Children; I. N. Danforth, M.D., Pathology; J. E. Owens, M.D., Surgery; Henry M. Lyman, A.M., M.D., Practice of Medicine, D. R. Brower, M.D., Therapeutics and Nervous Diseases; Sarah H. Stevenson, M.D., Corresponding Secretary, Physiology; D. W. Graham, A.M., M.D., Anatomy; Plymouth S. Hayes, M.D., Chemistry.

For information or announcement, address either of the Secretaries, at 125 State Street.

Sunnyside Medical Retreat
For Mental and Nervous Diseases, Inebriety and the Opium Habit,
FORT WASHINGTON, NEW YORK CITY.

This home, situated on the banks of the Hudson, under the management of Dr. Edward C. Mann, late Medical Superintendent of the New York State Emigrant Insane Asylum, receives cases of either sex affected with mental disorders, Inebriety or the Opium habit. The beauty of location and surroundings, handsomely furnished apartments, and the attentions and comforts of home life, all combine to make Sunnyside an attractive and popular private retreat. Applications may be made to Dr. Mann, either by mail or personally, at Fort Washington. Twelve trains daily from Hudson River Depot, 30th St., and 10th Ave. Broadway and 23d St. line of stages run direct to depot. The profession respectfully invited to call, and cordially welcomed. 1152-1y

Starling Medical College,
COLUMBUS, OHIO.

The Thirty-third Session of Starling Medical College will begin October 2, 1879, and continue until March, 1880. It will be preceded by a preliminary course beginning September 3, 1879. Extensive additions have recently been made to the Museum and other teaching facilities of the College.

FACULTY.—F. Carter, M.D., Dean; H. G. Landis, M.D.; J. H. Pooley, M.D.; S. Loving, M.D.; J. M. Wheaton, M.D.; E. B. Fullerton, M.D.; W. J. Conklin, M.D. (of Dayton); Alex. Dunlap, M.D.; Otto Frankenburg, M.D.

Lecture Tickets, including matriculation, $45.

College, cor. of State and Sixth Sts.; Dean's Office, 181 E. State St.

Letters of inquiry should be addressed to the Dean.

Prof. FRANCIS CARTER, M.D., Dean, Columbus, Ohio.
1150-1201

COLUMBUS MEDICAL COLLEGE.

Preliminary Course begins September 1st.

Regular Course October 1st, 1878, and closes the last week in February, 1879.

Tickets	*$30.00*
Matriculation	*5.00*
Graduation	*25.00*
Demonstrator	*5.00*

SESSIONS OF 1879-'80

FACULTY.

JAMES F. NOYES, M.D.,
Emeritus Professor of Ophthalmology and Otology.

THEO. A. McGRAW, M.D., President,
Professor of Principles and Practice of Surgery and Clinical Surgery.

GEORGE P. ANDREWS, M.D.,
Professor of Principles and Practice of Medicine and Clinical Medicine.

C. B. GILBERT, M.D.,
Professor of Obstetrics, and Diseases of Women and Children.

N. W. WEBBER, M.D.,
Professor of General and Descriptive Anatomy, and Clinical Surgery.

SAMUEL P. DUFFIELD, PH.D., M.D.,
Professor of Toxicology and Medical Jurisprudence.

ALBERT B. LYONS, M.D.,
Professor of Chemistry and Director of the Chemical Laboratory.

LEARTUS CONNOR, M.D., Secretary,
Professor of Physiology and Diseases of the Eye and Ear.

H. O. WALKER, M.D.,
Lecturer on Anatomy and Genito-Urinary Diseases.

E. L. SHURLY, M.D.,
Lecturer on Materia Medica, Therapeutics and Clinical Laryngology.

HAL. C. WYMAN, M.D.,
Lecturer on Physiology.

J. G. JOHNSON, M.D.,
Lecturer on Diseases of Mind and Nervous System.

J. H. CARSTENS, M.D.,
Lecturer on Clinical Medicine.

F. A. SPALDING, M.D.,
Lecturer on Diseases of the Skin.

C. C. YEMANS, M.D.,
Lecturer on Chemistry.

E. A. CHAPOTON, M.D.,
Demonstrator of Practical Physiology and Instructor in Anatomy and Surgery.

J. W. ROBERTSON, M.D.,
Demonstrator of Practical Microscopy.

DAVID INGLIS, M.D.,
Instructor in Chemistry and Physiology.

E. B. WARD, M.D.,
Curator of Museum and Librarian.

The Collegiate Year is divided into three sessions.

Preliminary Session opens Wednesday, September 3d, 1879, and closes September 30th. The Clinics are held and the Lectures delivered by the Professors of the regular Faculty, and in the same order and frequency as during the Winter Term. Opportunity is given to dissect or work in the Chemical and Physiological Laboratories.

The Regular Session opens Wednesday, October 1st, 1879, and closes March 2d, 1880. During this term all the branches of *General Medicine* and *Surgery*, both scientific and practical, are taught with care and thoroughness. All students are daily examined on the subjects of the lectures and on their dissecting and laboratory work.

Senior students have *daily practice* in the *art of examining patients*, in forming their own diagnosis, prognosis and treatment. As this is done under the direction of the professor holding each clinic, and in the presence of the class, it constitutes an invaluable course of training.

The Recitation Session begins March 10th, 1880, and closes June 23d, 1880. Daily during this term will be held recitations for both Seniors and Juniors, and one or two clinics and a lecture.

The recitations will embrace a thorough drill upon the general subjects of the Regular Session, viz.: Anatomy, Chemistry, Physiology, Practice of Medicine, Materia Medica and Therapeutics, Surgery, Obstetrics, Diseases of Women and Children.

Though the Recitation and Preliminary Sessions are optional, it is hoped that all who can will avail themselves of their manifest advantages in commencing the study of medicine, or in supplementing the regular winter course.

Three Hospitals—Harper's, St. Mary's and St. Luke's—with two large free dispensaries, afford an abundance of clinical material for illustrative and practical teaching.

All lectures are delivered on Hospital grounds. The *peculiar feature* of this school is the *intimate union* between its *laboratory*, *clinical* and *didactic* instruction.

Fees.—For Preliminary and Regular Sessions: Matriculation, $5. Hospital Fees, $10. Lecture Fees, $40. Graduation, $25. Lecture Fees to third course students, $25.

For the Recitation Term the Lecture Fees are $10, to those who attend the other courses. All others are required to matriculate and take out the Hospital tickets.

All fees payable in advance to the *Secretary*.

Announcement and Catalogue, or any further information which may be desired, can be promptly obtained by addressing

LEARTUS CONNOR, M.D., Secretary,
92 Cass Street, Detroit.

1165-1190

SPECIAL FACTS CONCERNING

BELLADONNA PLASTER

IN RUBBER COMBINATION.

PREPARED BY

SEABURY & JOHNSON.

In undertaking the manufacture of Medicinal Plasters we had but one object in view—THE IMPROVEMENT OF ALL KINDS OF PLASTERS. Among the various plasters manufactured by us was BELLADONNA PLASTER. This article met with a larger demand than some of the others, acquired a reputation among the best druggists, and received the confidence of the profession. Its large sale interfered with rival manufacturers, and continuous efforts have been made on their part to prejudice physicians against it.

As these attacks have been of late more malicious than usual, we have deemed it advisable, in self-defence, and in order to place our article fairly before the practitioner, to assign reasons why we consider it the most thoroughly reliable preparation ever offered the medical profession. First, it is a combination of the Alcoholic Extract of Belladonna only, with purified rubber, and thus possesses all of the advantages of the rubber base, being pliable, convenient of application, and not subject to the deteriorating influence of age, as is the case when any other base is used. Secondly, it is freed from all irritative properties. Thirdly, it is more adhesive than any other plasters. Fourthly, we believe it to be as perfect, in every respect, as it is possible to make a Belladonna plaster.

ENGLISH EXTRACTS—WHY WE DO NOT EMPLOY THEM.

Imported English Extracts are prepared from the Inspissated Juice of the leaf, while our pharmacopœia formula is treated by Alcohol. The active principle of Belladonna (Atropia) is only partially obtained by Inspissation. The employment of Alcoholic or Hydro-Alcoholic Solvents completely exhausts the entire strength of the drug.

The value of both preparations is clearly presented in an able treatise published in the *American Journal of Pharmacy*, April 1876, page 145. Our own investigations are substantially identical:—

TABLE OF RESULTS,

	Test solution requisite for 100 cc. of Ext. Solution.	Percentage of Atropia in Extract.
EXT. BELLADONNÆ ALCOH. U. S. P.	*17·732*	*2·571*
GEO. ALLEN & CO., English	*9·73*	*1·411*
*HERRINGS & CO., " *	*8·133*	*1·179*
E. MERCK, Germany (aqueous extract), made 1869	*1·9*	*·275*

This analysis clearly establishes the fact that the **Alcoholic Extract of Belladonna of the U. S. P. averages over twice the strength of English Extracts,** and should, therefore, be preferred in all cases where a reliable article is desired. Inspissated and Aqueous Extracts deteriorate, while Alcoholic remain stable.

Therefore the assumption of pretentious manufacturers, that the English Extracts are the superior preparations, must be based on a former supposition rather than present facts. The following analysis substantiates our claim regarding English Extracts.

ANALYSIS OF BELLADONNA PLASTERS, BY PROF. R. OGDEN DOREMUS.

"BELLEVUE HOSPITAL COLLEGE, New York, Sept. 7, 1878.

"GENTLEMEN—I obtained from Messrs. W. H. Schieffelin & Co., of this city, samples of Belladonna Plasters prepared by Grosvenor & Richards, Boston; Mitchell Novelty Plaster Works; Seabury & Johnson, New York and London. I have examined these varieties for the purpose of determining which possesses the largest quantity of Atropine. I employed equal surfaces of each, and *my analysis demonstrated that* SEABURY & JOHNSON'S *contains the greatest proportion* of the active principle of Belladonna. "R. OGDEN DOREMUS, M.D., L.L.D."

Belladonna Plaster, prepared by Seabury & Johnson, is packed in elegant tin cases, which contain 1 yard each, and can be obtained of almost any druggist throughout the United States and Canada, or will be furnished direct by mail. Samples sent on application.

SEABURY & JOHNSON,

ALWAYS SPECIFY SEABURY & JOHNSON'S PLASTERS.

THE WEEKLY
MEDICAL AND SURGICAL REPORTER.

THE MEDICAL AND SURGICAL REPORTER has been established over thirty years, and has, it is believed, a *bonâ fide* subscription list unsurpassed by any medical weekly in America.

It is issued every Saturday, neatly cut and bound, and gives 24 large octavo, doubled-columned pages of reading matter in each number. It claims the following

SPECIAL FEATURES:

IT IS INDEPENDENT, being controlled by no clique, college, society or publishing house.

COSMOPOLITAN. Having subscribers and contributors in every State in the Union, it is edited in the interest of the *whole profession*, not of one section or locality.

EMINENTLY PRACTICAL. Special prominence is given to Diagnosis and Therapeutics—the *recognition* and the *treatment* of disease, the real *business* of the professional man.

UNSURPASSED IN CHEAPNESS. When the *size* and *number* of its pages, and its frequency of issue are taken into account, it gives more matter for the money than any other medical journal in this country.

PARTICULARLY SUITED TO COUNTRY PHYSICIANS. It has always been a special aim of the editor to furnish a journal that would keep a reader remote from medical centres *fully up to the times* in his profession. Every surgical invention and new remedy of value, every medical book of moment, every professional discussion or news item of interest, will be found recorded in its pages. *Contributions* from country physicians are always welcome.

THE HALF-YEARLY COMPENDIUM

Appears on January 1st and July 1st of each year, forming two semi-annual volumes of 300 large octavo pages each, with complete Index. It has been established ten years, with a constantly growing circulation.

☞ While complete in itself, it is also intended as a **Companion Journal to the Medical and Surgical Reporter**; it is made up from articles *which have not been included* in the latter. The one journal is the Complement of the other.

From 600 to 700 separate articles appear each year in its various departments, carefully prepared, and giving the choicest selections from all sources, American and Foreign. It is the *only* work of the kind which does justice to *American* writers in medicine.

The Physician's Daily Pocket Record,

COMPRISING A VISITING LIST, MANY USEFUL MEMORANDA, TABLES, Etc.

By S. W. BUTLER, M.D.

Edited Annually, and Adapted for 35 or 70 Patients Daily. Strongly Bound in Morocco, with Steel Spring Clasp.

PRICE: { **Edition for 35 Patients Daily, - - $1.50**
" 70 " " - - 2.00

☞ The name of the purchaser will be stamped in gilt letters on the tuck, for 10 cents extra. ☜

PRICES PER YEAR.

DR. L. D. McINTOSH'S
Electric or Galvanic Belt.

If this new combination could be seen and tested by the medical profession, few, if any, words would be needed from us in its favor, for it combines utility with simplicity in such perfection that seeing it is convincing proof of its great value. The medical profession to-day acknowledge, almost universally, Electro-Therapeutics.

This combination is composed of sixteen cells, placed in pockets on a belt. Each cell is made of hard vulcanized rubber, lined with a copper cell, which constitutes the negative plate. The rubber coating perfectly insulates each cell. The positive plates are of zinc, wrapped in a porous material, to absorb the exciting fluid and prevent contact with the copper, and permit the current to pass from the copper to the zinc.

Thus the cells are charged without wetting the belt, and the discomfort following to the patient. A wire is soldered to each zinc plate, which connects with the copper cell by entering a tube on its side, thus rendering the belt pliable.

The McIntosh Electric Belt is superior to all others for the following reasons:—

It is composed of sixteen cells—thus giving a powerful current. A current selector is so arranged that one or more cells can be used at pleasure. There is not anything irritating about the Belt, as is the case with all other contrivances where the metal used is wet with weak acids and placed next to the skin. The electrodes are pieces of metal covered similar to ordinary battery electrodes, and connected with the cells by connecting cords. By this arrangement, a current from the Belt can be applied, to produce a general or local effect.

Physicians who have used this belt in their practice do not hesitate to recommend it to the profession.

Our pamphlet on Medical Electricity sent free on application. Address

McINTOSH GALVANIC BELT AND BATTERY CO.,

HORSFORD'S

Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges.

MANUFACTURED BY THE

RUMFORD CHEMICAL WORKS,

1155–1206 PROVIDENCE, R. I.

LONG ISLAND COLLEGE HOSPITAL, BROOKLYN, NEW YORK.

ANNUAL ANNOUNCEMENT, 1878-79.

THE READING AND RECITATION TERM will commence October 1, 1878, and close at the beginning of the Regular Term. THE REGULAR TERM will open February 1, 1879, and continue five months.

SAMUEL G. ARMOR, M.D., LL.D., Professor of the Practice of Medicine, and Dean.
GEORGE W. PLYMPTON, A.M., Professor of Chemistry.
JOSEPH H. RAYMOND, M.D., Professor of Physiology.
DANIEL AYRES, M.D., LL.D., Emeritus Professor of Surgery.
ALEXANDER J. C. SKENE, M.D., Professor of Diseases of Women and Children.
EDWARD SEAMAN BUNKER, M.D., Professor of Obstetrics.
CORYDON L. FORD, M.D., Professor of Anatomy.
JARVIS S. WIGHT, M.D., Professor of Surgery, and Registrar.
JOHN D. RUSHMORE, M.D., Professor of Materia Medica.

THE CLINICAL ADVANTAGES OF THE LONG ISLAND COLLEGE HOSPITAL ARE UNSURPASSED IN THIS COUNTRY.

For Circulars, address DEAN or REGISTRAR. 1122-1178

UNIVERSITY of MICHIGAN.

DEPARTMENT OF MEDICINE AND SURGERY.

The 30th annual course of lectures will commence on October 1st, 1879, and continue *nine months*.

Course separate, but equal, for women.

Matriculation Fee, *paid but once*—Residents of Michigan, $10; non-residents, $25. Annual Dues—Residents of Michigan, $20; non-residents, $25. Graduation Fee—for all alike, $10.

FACULTY.

James B. Angell, LL. D., President, Alonzo B. Palmer, M.D., Professor of Pathology and the Practice of Medicine, Corydon L. Ford, M.D., Prof. of Anatomy and Physiology. Albert B. Prescott, M.D., Professor of Organic and applied Chemistry and Pharmacy. George E. Frothingham, M.D., Professor of Materia Medica, Ophthalmology and Otology. Donald Maclean, M.D., Professor of Surgery. Edward S. Dunster, M.D., Professor of Obstetrics and Diseases of Women and Children. John W. Langley, M.D., Professor of General Chemistry and Physics. Will. J. Herdman, M.D., Demonstrator of Anatomy. Charles H. Stowell, M.D., Instructor in Physiological Laboratory. Victor C. Vaughan, PH.D., Instructor in Medical Chemistry.

Send for Circular and Catalogue.

A. B. PALMER, M.D., DEAN, Ann Arbor, Mich. 1133–1184

Dextro-Quinine in Intermittent Fever.

Case.	Name and Sex of Patient.	Age, etc.	Number of Paroxysms before taking.	Number of Paroxysms after.	Dose and Mode of Exhibition.	Total amount Exhibited.	Remarks, Pathological and Physiological Phenomena, etc.	Reported by
1	J. S. S.	27	14	0	10 grs. at bedtime.	30 grs.	I have found Dextro-Quinine fully equal to the Sulphate of Quinia, with almost none of the disagreeable symptoms of the latter.	F. C. Hageman, M.D., Seaford, L.I.
2	D. V. W.	14	5	0	8 grs. at bedtime.	24 grs.		
3	Emma L.	16	60 or more.	0	5 grs. every three hours, in glycerine, without intermission, only during febrile exacerbations, etc.	30 grs.	Patient was very much prostrated with typho-malarial fever; been under the care of another physician; was called in on the third week. I then prescribed 5 grs. of Dextro-Quinine every three hours, in glycerine, when, as it were by magic, all the grave symptoms abated at once, and the patient made a rapid recovery.	Alex. F. Joseph, M.D., Napoleon, Ind.
21	Mrs. S., *Double Quotidian.* Had taken large doses Cinchonidia sulphate without effect.	22 Brunette. Married. No children.	6	0	20 grs. divided into chart. No. v, one every two hours.	20 grs.	Had first paroxysm Nov. 20, 6 A.M., again at 4 P.M. Presented Cinchonidia sulphate, grs. xxx, chart. No. v. One to be taken every two hours. Nov. 21. Return of paroxysm at 6 A.M. and 4 P.M. Gave Cinchonidia sulphate, grs. xlv, chart. No. v. One to be taken every two hours. Nov. 22. Return of paroxysm at same time as on preceding days. Prescribed Dextro-Quinine, grs. xx, chart. No. v. One to be taken every two hours. No return of chill since that date, and highly pleased with my experience.	N. H. Manring, M.D., Rigdon, Ind.
15	I. de L., female. *Tertian.* Habituated to Quinia.	19 Married.	2	0	15 grs. in 3 doses of 5 grs., taken at intervals of ½ hour, commencing four hours before expected paroxysm. Taken in capsule.	15 grs.	Dilatation of pupil; tinnitus aurium severe, but not so much so as on former occasions when Sulphate of Quinia was used. Directed her to take 10 grains on the third day, but she did not do so. Twelve days have elapsed without return of chills. Is taking citrate of iron and strychnia.	
16	Jennie S., colored. *Quotidian.* Has "used Quinine and everything else," as she herself expressed it.	25 Married.	Unknown, but a very large number.	1	16 grs. in 4 doses, in capsule, with 1-16 gr. Morph. acet., to be taken at ½ hour intervals, commencing four hours before expected paroxysm.	48 grs.	On first evening after exhibition of Dextro-Quinine had a very slight ague, followed by considerable fever, which, however, soon passed off. Gave Hydrarg. Chlor. Mite, grs. x, at bedtime, which caused three or four operations of the bowels. The Dextro-Quinine was continued the next day. *Missed chill for first time in over a month.* Thought it best to continue medicine (without Morphia) another day. Has had no return up to to-day (10 days). Did not complain of tinnitus.	Frank S. James, Ph.D., M.D., Osceola, Ark.
5	Mary B.	3½	3	0	1 gr., in solution, every three hours.	16 grs.	Commenced the Dextro-Quinine just after last paroxysm; it acted excellently. It is now more than four weeks since she took the remedy; there has been no return. She is now in the enjoyment of good health.	G. H. Berry, M.D., New York City.
6	Edward Libby. *Tertian.*	24	9 or 10	0	Two 12-grain doses at half-hour intervals.	24 grs.	Had been taking Sulphate of Quinia in 5-gr. doses for some time, with little or no effect. Has had no chill since the Dextro-Quinine was administered (more than a month having elapsed), and the result is entirely satisfactory.	H. A. Weymouth, M.D., Saco, Me.
11	Mary Cavanough. *Quotidian.*	3	One a day for six months.	0	2 grs. in powder, every two to three hours.	15 grs.	Little girl had been complaining with chills and fever for over six months; had used Sulphate of Quinia, Tincture Cinchona, Cincho-Quinine, etc. *Had taken great quantities of Sulphate of Quinia, without effecting a cure. I gave in all about 15 grs. of Dextro-Quinine, and she never has had any chill since.* This one case in particular I think a remarkable one. The little girl had had chills regularly, almost every day, for over six months, had been treated by two physicians, and a cure could not be effected, as they and the family thought, under any circumstances. I was called directly after, and gave 2 grs. *Dextro-Quinine,* in powder, every two to three hours, and to my great surprise, as well as every one else's, she failed to have any more chills. I then put her on a tonic of iron, and she is now enjoying good health. I consider the Dextro-Quinine far superior to any of the preparations of Quinine, and, from what I have seen of its medicinal effects, I do not hesitate to recommend it as superior to all other remedies in Remittent and Intermittent Fevers.	J. H. Struble, M.D., Stanhope, N. J.

DEXTRO-QUININE sent by mail, at the rate of $1.60 per ounce, to Physicians who cannot be supplied by their local Druggists. Address

KEASBEY & MATTISON, Philadelphia.

In corresponding with Advertisers please mention THE MEDICAL AND SURGICAL REPORTER.

BE CAREFUL TO SPECIFY McKESSON & ROBBINS'.

IMPORTANT TO PHYSICIANS!

The fact that Sulphate of Quinine is only soluble in over 700 parts of water is not generally known, or if known is not usually considered, except in prescriptions, when this difficulty is overcome by the addition of Acid; and the further fact that **Bi-Sulphate of Quinine** is soluble in **only 10 parts of water** is as little appreciated.

McKesson & Robbins have paid much attention to the subject of putting Quinine into Pills, in a condition approaching that of a solution, and have at last succeeded in their **BI-SULPHATE OF QUININE PILLS,** and offer the same to the profession, confident that they will stand any test for solubility and prompt action. Physicians will please always specify **McK. & R. Bi-Sulph. Quinine Pills,** and they will not be disappointed in results.

Note.--With no reference to *respectable* druggists, we would say that cases have come to our knowledge and have been noted, where other pills have been substituted on prescriptions for ours.

POWDERED PURIFIED CHINOIDINE.

Containing all the Non-Crystalizable Alkaloids of Cinchona Bark.

Similar preparations have been lately offered in market AT HIGH PRICES under different fancy appellations, and claims made for the same as of equal efficiency with Quinine.

As a great demand exists for a cheap anti-malarial remedy, we introduce this preparation at low figures; and, in order that the profession may judge practically of its merits, will forward a sample to any physician's address, or mail one ounce upon receipt of FIFTY CENTS.

Yours respectfully,

McKESSON & ROBBINS,

Wholesale Druggists and Manufacturing Chemists,

91 FULTON ST., *NEW YORK.*

SPECIFY McKESSON & ROBBINS' Oval Shape, Compressed Coating.

GRANULATED EFFERVESCENT SALTS

PREPARED BY

WILLIAM R. WARNER & Co.,

CHEMISTS,

PHILADELPHIA.

Granulated Effervescent

VICHY SALT.

(Grand Grille.)

A large teaspoonful dissolved in half a glass of water, forms a grateful and refreshing draught, identical with the natural water. Per dozen, $4.00

Granulated Effervescent

SELTZER SALT.

A tablespoonful to half a glass of water forms a grateful and refreshing saline draught, identical with the natural water. Per Dozen, $4.00

Granulated Effervescent

SEIDLITZ MIXTURE.

(Seidlitz Powder, U. S. P.)

An excellent aperient and refrigerant, very acceptable to the stomach. Per doz. $4.00

DOSE.—One tablespoonful in a glass of water.

Granulated Effervescent

NITRATE of POTASSIUM.

A dessert-spoonful in glass of water makes an excellent mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

CITRATE OF POTASSIUM.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $5.00

Granulated Effervescent

Bi-Carbonate of Potassium.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

Pepsin, Bismuth and Strychnia.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin, soluble Citrate of Bismuth, and the sixtieth grain of Citrate of Strychnia. Per dozen, $10.00

Granulated Effervescent

PEPSIN AND BISMUTH.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin and soluble Citrate of Bismuth. Per doz. $9.00

Granulated Effervescent

CITRATE OF MAGNESIA.

(Pleasant and Efficient.)

For a purgative effect, take two or more tablespoonfuls added to a small glass of water, and drink while effervescing. As a laxative, one or more tablespoonfuls taken in the same manner. One or two teaspoonfuls in sweetened water, produces a delightful, cooling drink in summer. Per dozen, $4.00

Granulated Effervescent

CITRATE LITHIA.

Each drachm or teaspoonful contains four grains of the chemically pure salt. Valuable in Rheumatic, Gouty and Analogous disorders. Per dozen, $10.00

Granulated Effervescent

KISSINGEN SALT.

A large teaspoonful dissolved in half a glass of water, forms an agreeable and refreshing draught identical with the natural water. Per dozen, $4.00

Granulated Effervescent

CRAB ORCHARD SALT.

Prepared from the exact analysis of the purified natural salt, obtained from the Crab Orchard Spring, Ky.

A tablespoonful in half a glass of water forms a grateful effervescing draught, producing the effect of the natural water. Per dozen, $4.00

Granulated Effervescent

OXALATE OF CERIUM.

Each drachm or large teaspoonful contains two grains of Oxalate of Cerium. Per dozen, $5.00

Granulated Effervescent

CITRATE CAFFEINE.

A dessert-spoonful containing one grain of Citrate of Caffeine should be given for sick headache, every hour or two before and during the paroxysms. Per dozen, $10.00

Physicians will please specify Warner & Co.—Equal to best English.

SOLUTION
FERROUS CHLORIDE.

This Solution of Iron is the lowest form of Chloride. It is much less styptic in taste than Tr. Iron Chloride, consequently pleasanter to the patient; it is much more easily assimilated by weak and irritable stomachs.

Knowing how difficult it is to introduce into the blood, in a proper form, a sufficient quantity of iron to be beneficial, we have manufactured and introduce the **Ferrous Chloride** as being easily absorbed and acting with much efficacy, even when given in small doses.

Dr. Rabuteau, who has specially studied the protochloride of iron, and shown that it is the most natural of ferruginous salts, thinks that he has found the very thing required:—

EXTRACT FROM THE REPORTS OF THE ACADEMY OF SCIENCES OF PARIS.
(*Sitting of* 11 *December*, 1871.)

". . . . . The most important thing is the facility with which the protochloride of iron is absorbed by the stomach. Two or three hours after from 4 to 10 grains of this salt have been ingested, almost the whole is absorbed. Having finally observed that the reduced iron and the ferruginous oxyds and carbonates are changed into protochloride in the stomach by the contact with the hydrochloric acid of the gastric juice, I thought it necessary to substitute this salt for all the preceding for medicinal purposes. My observations in the wards of hospitals and in my own practice have convinced me of the successful results of the protochloride of iron, which is easily borne when pure and administered in a proper way."

For details, see the memoirs on the protochloride of iron published in the *Union Médicale, Paris,* 1871 and 1872.

Each fluid drachm contains two grains of the Anhydrous **Ferrous Chloride.**

CASWELL, HAZARD & CO., Druggists and Chemists,
New York.

APOLLINARIS WATER.

HIGHLY EFFERVESCENT.

Approved by the Academy of Medicine of France, and its Sale in France as a Natural Mineral Water authorized by Special Decree of the French Government.

"The Exquisite Apollinaris."—Dr. J. Milner Fothergill. "Queen of Table Waters."—Lon. Med. Record.

APOLLINARIS WATER has been the subject of the most favorable reports from Professors Fordyce Barker, Ogden Doremus, Austin Flint, W. A. Hammond, Loomis, F. N. Otis, E. R. Peaslee, Sayre, Marion Sims, James R. Wood, New York, etc., etc.

APOLLINARIS	Used habitually as a table water, its pleasant taste and richness in pure carbonic acid favorably distinguish it from the other similar mineral waters.—Prof. Dr. VIRCHOW, *Member of the German Parliament, and Professor University of Berlin.*
APOLLINARIS	EXCEPTIONALLY VALUABLE and PLEASANT as a table-water in HYGIENIC as well as DIETETIC respects; maintains its FRESHNESS on the PALATE when constantly used.—Prof. Dr. OSCAR LIEBREICH, Berlin.
APOLLINARIS	I have for many years always obtained the best success with this water in cases of severe DISORDERS of the DIGESTION; in PHTHISIS, during CONVALESCENCE from severe Illnesses, after TYPHUS PNEUMONIA, ARTICULAR RHEUMATISM, and also in DIPHTHERIA, and in the various other diseases in which it was necessary to produce a TONIC EFFECT upon the STOMACH and the DIGESTION. I have of late almost EXCLUSIVELY EMPLOYED IT.—Prof. Dr. OERTEL, Munich, *Author of Treatise on Diphtheria, &c., Ziemssen's Cyclopædia.*
APOLLINARIS	REFRESHING, PROMOTES DIGESTION, and is especially to be recommended as an adjuvant in the following morbid conditions: DYSPEPSIA characterized by ACIDITY of the STOMACH, GASTRO-ENTERALGIA, tendency to GALL-STONES, GOUTY conditions, CATARRHAL affections of the GENITO-URINARY MUCOUS MEMBRANE, and UTERINE CONGESTION leading to CATAMENIAL HEMORRHAGE. The habit of drinking Apollinaris Water has SAVED many from TYPHOID Fever, while their COMPANIONS drinking COMMON WATER were INFECTED.—Dr. HERMANN WEBER, *Fellow of the Royal College of Physicians, London, &c., &c.*

Further Testimonials from numerous authorities, including Professors Frankland, F.R.S., Lond.; Odling, F.R.S., Oxford; A. W. Hoffmann, F.R.S., Privy Councillor, Berlin; Kekulé, Rector of University of Bonn; Professors Ditterich, Munich; Nussbaum, Munich; Varrentrapp, Frankfort; T. K. Chambers, Physician to the Prince of Wales; Peter Hood, M.D.; Peter Squire, F.L.S., Chemist to the Queen, and others; Professors Drs. Labbé, Fauvel, A. Latour, L. Championnière, Constantin James, Lutaud, &c., France, and many others, have been published and may be obtained on application to

F. DE BARY & CO., 41 & 43 Warren St., New York.

Apollinaris Water may be had of all Wine Merchants, Grocers, Druggists, and Mineral Water dealers throughout the United States.

Chicago Medical College.

Medical Department of the Northwestern University.

SESSION OF 1879-80.

FACULTY.

N. S. DAVIS, M.D., LL.D., DEAN, } Professors of Prin-
H. A. JOHNSON, A.M., M.D., } ciples and Practice of Medicine and of Clinical Medicine.

EDMUND ANDREWS, A.M., M.D., } Professors of
RALPH N. ISHAM, M.D., } Principles and Practice of Surgery, and of Clinical Surgery.

EDWARD W. JENKS, A.M., M.D.,
Professor of Medical and Surgical Diseases of Women, and of Clinical Gynecology.

E. O. F. ROLER, A.M., M.D.,
Professor of Obstetrics and Diseases of Children.

SAMUEL J. JONES, A.M., M.D.,
Professor of Ophthalmology and Otology.

J. H. HOLLISTER, M.D.,
Cor. Secretary & Registrar, Professor of General Pathology and Pathological Anatomy.

J. S. JEWELL, A.M., M.D.,
Professor of Nervous and Mental Diseases.

H. P. MERRIMAN, A.M., M.D.,
Professor of Medical Jurisprudence and Hygiene.

WM. E. QUINE, M.D.,
Professor of Materia Medica and General Therapeutics.

MARCUS P. HATFIELD, A.M., M.D.,
Professor of Chemistry and Toxicology.

LESTER CURTIS, A.M., M.D.,
Professor of Histology.

R. L. REA, M.D.,
Professor of Anatomy.

HENRY GRADLE, M.D.,
Lecturer upon Physiology.

ROSWELL PARK, A.M., M.D.,
Demonstrator of Anatomy and Assistant to the Chair of Anatomy.

GRADED COURSE OF INSTRUCTION.

A graded system of medical instruction was adopted at the organization of this College, twenty years ago, and for twelve years it was the only representative of a classified course in this country. The recommendation of this method of teaching by two Medical College Conventions, by the American Medical Association, and by various State Medical Societies; and its more recent adoption by a number of other colleges, including some of the most prominent ones in the land; and its very general approval by the profession at large, afford gratifying evidence that this new departure was a movement in the right direction.

REQUIREMENTS FOR ADMISSION.

All applicants for admission are required to present evidence of graduation in some literary college, or certificates of attendance upon some scientific school or academy. If the applicant have neither diploma nor certificate, he must sustain a satisfactory examination as to his literary qualifications.

ADVANCED STANDING.

Students who have read medicine for one full year may enter upon the *Middle Course*, by sustaining satisfactory examinations upon studies embraced in the Junior Course.

Students who have read medicine for two years, including attendance upon one full course of lectures in some recognized medical college, may enter the *Senior Course*, by sustaining examinations upon the subjects embraced in the Junior and Middle Courses.

THE COLLEGE TERM.

A Preliminary course of Didactic and Clinical instruction, introductory to the general course, commences September 16th and continues till the commencement of the regular Session.

THE REGULAR COURSE of lectures commences Tuesday, September 30th, and will continue until March 30th, at which time the usual Commencement exercises will be held.

THE PRACTITIONERS' COURSE,

Designed for practitioners, will commence March 31st, 1880, following the Commencement, and will continue till April 28th. This special course is arranged to meet a very general want, and will afford special advantages for a *rapid*, yet *thorough*, practical review of the most important subjects in medicine and surgery.

CLINICAL ADVANTAGES.

Mercy Hospital, with its very perfect appointments; the Dispensary and the College clinics, offer an abundance of clinical material in every department of Medical and Surgical teaching. Over fourteen thousand patients were treated here during the *last year*.

In the Hospital every Senior student serves as dresser for an allotted term in the surgical wards, and receives a certificate to that effect.

Every Senior student has personal charge of one or more cases of obstetrics, under the immediate supervision of the Professor of obstetrics.

In the Gynecological Department, where large numbers of females apply for local treatment, each Senior student is trained by the Professor in the minute details of examination and treatment of the medical and surgical diseases of women.

PHYSIOLOGICAL LABORATORY.

Aided by the generous contributions of its alumni, this College is developing a PHYSIOLOGICAL LABORATORY, which will be opened for instruction during the present year.

PRIZES

Will be given by the Dean, for the best Thesis; by the Professor of Anatomy, a First Prize to the best Anatomist—open to all classes; Second Prize to the best Anatomist in the Junior Class; the Senn Prize, for the best Anatomical Preparation; and the Earl Prize, for the best Essay on Diseases of Children.

FEES.

Lecture Fees for the College Year, $75.00. Practitioners' Course, $30.00. Graduation Fee, $30.00. Registration Fee, $5.00. Demonstrator's Ticket, $5.00. Laboratory Ticket, $5.00. Hospital Ticket, $6.00.

For information concerning Text Books, Board, Seats in the College, requirements for Graduations, etc., consult the Annual Announcement, or address

PROF. J. H. HOLLISTER, M.D.,

SECRETARY AND REGISTRAR.

1167, 68, 70, 72, 75, 76 73 Randolph Street, Chicago, Ill.

DUREL'S
TAR AND IRON SYRUP AND CAPSULES.

PREPARED BY DUREL, PHARMACIST, PARIS.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron is a desideratum which has at last been attained in these preparations. The indications for such a remedy are many, but it has been found especially useful in CHLOROSIS, BRONCHIAL CATARRH, CATARRH OF THE BLADDER, CHRONIC UTERINE DISCHARGES, depending upon an enfeebled or relaxed state of the system.

Sold by Chemists generally.

CRINON'S HÆMOGLOBIN,

The Albuminoid Ferruginous Principle of Blood.

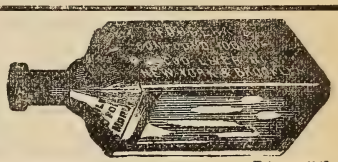
HÆMOGLOBIN is the only physiological chalybeate. Associated as it is with the phosphates of the blood, it forms the most powerful of tonics, and at the same time a most nourishing food. It is especially useful in cases of *Anœmia*, *Chlorosis*, *Cachexias*, *Exhaustion* caused by excess of work, nervous debility, fatigue resulting from parturition and lactation. It replaces entirely liquid blood, which has been recommended and used with success in *Phthisis* and *wasting away*.

It is offered in two forms: In cachets (wafers), 60 of which are contained in a box; combined with chocolate in small squares, 30 of which are in a box; both forms can be sent by mail.

Prepared by C. CRINON, Paris, Pharmacist of the first class, Laureate of the Hospitals of Paris. Samples may be obtained by application to

E. FOUGERA & CO., New York, Agents for the U. S.

FOUGERA'S COMPOUND IODINISED
COD LIVER OIL.



Since the introduction of this oil in 1858, it has been found to be superior to all other kinds of Cod Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod Liver Oil, but also the **tonic, stimulant** and **alterative** properties of **Iodine, Bromine** and **Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod Liver Oil.

Through its **increased curative action, FOUGERA'S COD LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod Liver Oil would fail entirely.

FOUGERA'S READY-MADE MUSTARD PLASTERS.

A most useful, convenient, clean, and economical preparation. Not liable to change if kept in a dry place. Made of two strengths. Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box or tin roll, of 10 plasters each. DIRECTIONS.—Dip the Plaster, or Plasters, a minute or two, in cold water; apply on the part, and cover with a band.

FOUGERA'S COMPOUND ICELAND MOSS PASTE.

(Iceland Moss, Lactucarium, Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, etc.

Wakefulness, Cough, and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this Paste.

FOUGERA'S IODO-FERRO-PHOSPHATED ELIXIR OF HORSE-RADISH.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of antiscorbutic and aromatic plants, and acts as a **tonic, stimulant, emmenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

To whom all orders should be addressed.

SOLD BY DRUGGISTS GENERALLY.

TO THE MEDICAL PROFESSION.

MALTINE.

(Extract of Malted Barley, Wheat & Oats.)

THIS PREPARATION

Contains from three to five times the Medicinal and Nutritive elements found in Extract of Malt.

MALTINE is a highly concentrated extract of malted *Barley*, *Wheat*, and *Oats*, containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST.—In the manufacture of **MALTINE** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates, and Albuminoids, on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity, possessing little virtue aside from the saccharine matter which it contains.*

SECOND.—*Carbon*, *Hydrogen*, *Nitrogen*, *Sulphur*, *Iron*, *Magnesium*, and *Potassium*, are essential elements in the food of man, and it is only in **MALTINE**, containing the combined properties of malted *Barley*, *Wheat*, and *Oats*, that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD.—*Gluten* is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. **MALTINE** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH.—Liebig says, "Wheat and Oats stand first among our list of cereals in combining all the elements in proportions necessary to support animal life. They are especially rich in muscular and fat producing elements." The only reason we use Malted Barley, in the manufacture of **MALTINE**, is that it contains larger proportions of mineral matters (bone producers) and Diastase. It is deficient in all other essential elements.

We believe that any practitioner will readily recognize the superiority of MALTINE, and would request a trial and comparison of merits with any article offered for similar uses.

* As a sure test for Diastase, and the Albuminoids, a small quantity should be put in a test tube or small vial, largely diluted with water, and heated to the boiling point, when the Albumen, if present, will coagulate, and appear in little flocculent particles throughout the liquid. If the extract remains clear, it is proof that it has already been coagulated by excessive heat, and removed by filtration during the process of manufacturing. Any heat which will coagulate Albumen will inevitably destroy the digestive power of Diastase.

The Nitrogenous constituents of ***MALTINE*** have a composition identical with that of the chief constituents of the Blood, and therefore contain nearly every element requisite for the reproduction of the human body.

MALTINE AND ITS COMPOUNDS

can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULÆ AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS, AND ON THE LABEL ATTACHED TO EACH BOTTLE:

***MALTINE* WITH HOPS.**

***MALTINE*, FERRATED:**

This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

***MALTINE* WITH PHOSPHATES IRON AND QUINIA:**

A powerful general and nutritive tonic.

***MALTINE* WITH PHOSPHATES IRON, QUINIA AND STRYCHNIA:**

A powerful nutritive, general and nervous tonic.

***MALTINE* WITH PEPSIN AND PANCREATINE:**

One of the most effective combinations in Dyspepsia, Cholera Infantum, and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the ***MALTINE***. We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

***MALTINE* WITH BEEF AND IRON:**

One of the most valuable combinations in cases of General Debility, when there is deficient nutrition and a deficiency of Iron in the system.

***MALTINE* WITH ALTERATIVES:**

In this preparation ***MALTINE*** is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.

MALTINE WINE.

This preparation contains all the medicinal and nutritive constituents of ***MALTINE***, less 60 per cent. of the transformed starch or glucose, which renders the preparation lighter and more acceptable to some stomachs, and is recommended only in such cases.

***MALTINE WINE* WITH PEPSIN AND PANCREATINE:**

(Each fluid ounce of MALTINE WINE contains 15 grains pure PEPSIN and 15 grains pure PANCREATINE).

We can recommend this preparation to the Medical Profession as being the most important remedy ever brought to their notice in all cases of Dyspepsia and Imperfect Nutrition, when the system needs invigorating and replenishing. It will be found, we believe, a perfect remedy in Vomiting in Pregnancy, Cholera Infantum and wasting diseases of children, and in Constipation and Chronic Diarrhœa resulting from mal-nutrition. It will agree with the most irritable stomach.

MALTO-YERBINE.

(Each pint of the above preparation contains 13 ounces MALTINE, 2 ounces CARRAGEEN and 1 ounce YERBINE).

With the nutritive, emollient and demulcent properties of ***MALTINE*** and ***CARRAGEEN***, and the expectoran t qualities of ***YERBINE*** (active principle of Yerba Santa), we offer this preparation to the Profession with the fullest confidence that it is the most perfect remedy yet produced in Chronic Pulmonary Affections, Irritation of the Mucous Membrane, Difficult Expectoration, Bronchitis and ordinary Coughs and Colds.

The Dose of all Preparations of ***MALTINE*** and compounds is from a dessert to a tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only.*

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in half-pint, pint and five-pint amber bottles; each bottle inclosed in a folding paper box.

REED & CARNRICK,

Manufacturing Pharmacists,

1137-1162-eow

196 and 198 FULTON STREET, NEW YORK.

VACCINE VIRUS.

In order to meet properly the continued demand upon us for ANIMAL VIRUS, we have established stables for its propagation upon carefully selected heifers. The lymph used is of the well-known "Beaugency" stock, imported by ourselves expressly for this purpose. The result of several years' experience in supplying this lymph leads us to believe that its excellence is unsurpassed. The establishment is under the care of a competent physician, who will spare no pains to produce a perfectly RELIABLE and PURE article, which we are prepared to furnish FRESH, DAILY.

We can also furnish, to those who prefer it, HUMANIZED VIRUS, from healthy children, procured for us by physicians of undoubted reliability.

All our Virus is put up in strong, *air-tight, sealed packages*, for safe conveyance by mail or express, and will be sent (post-paid if by mail) upon the following terms:—

From the Heifer, 10 large Ivory Points, well charged on both sides	$1.50
5 large Ivory Points, " " "	.80
Large Ivory Points, less than 5, " " " each	.25
1 Crust, new method, in air-tight Glass Capsule	2.00
From Healthy Infants, 10 small Ivory Points	1.50
1 Crust from Unruptured Vesicles	2.00

Directions for vaccinating with either form of Virus, derived from methods successfully employed, will be furnished with Virus if requested.

We will warrant every package of Points and every Crust, giving a fresh supply in case of failure reported within fifteen days for Points, thirty days for Human, and ninety days for Kine Crusts. We can usually furnish Crusts one remove from the heifer, if preferred.

On account of their unreliability, we have hitherto furnished the usual form of Kine Crust unwillingly. Under our new method of taking and preserving them, however, after careful tests and an experience extending over several months, the results attained have been so satisfactory that we now offer them as not less active and reliable than other forms of Virus, while less liable to become inert with lapse of time. We now offer them on very favorable terms, and recommend them for transmission to a distance, and in all cases where it is desired to preserve Virus for some weeks or months, or to keep a supply at hand for emergencies.

We also furnish UNCHARGED IVORY POINTS, for physicians' use, at the following rates:—

Small	per 100, 25 cents; per 1000 2.00
Large	per 100, 50 cents; per 1000 4.00

Orders by mail or telegraph answered by return train.

Liberal discounts upon large supplies for Cities, Towns, and Institutions.

SCARIFYING VACCINATOR, STEEL, NICKEL PLATED. See Cut. Each 25 cents.

New Illustrated Catalogue of Surgical Instruments sent, post-paid, on request.

1140-1191eow

BARON LEIBIG, the greatest authority on Infant Diet, states that the majority of children who die under one year of age, do so from the effects of improper food, or from the improper administration of the food.

HORLICK'S FOOD.

A Concentrated Extract, prepared according to the Formula of Baron Liebig, and, unlike other Foods,

IS NOT FARINACEOUS.

It is acknowledged by Physicians to be the best Food

For Infants, Dyspeptics and Invalids.

Prof. J. Lewis Smith Says,

Speaking of **HORLICK'S FOOD:** "Being carefully prepared, according to Liebig's Formula, by Chemists fully competent, it possesses certain advantages, such as quick and easy preparation and a pleasant flavor, and is therefore highly esteemed by those who have used it." [*Page* 58 *of the fourth edition of a Treatise on Diseases of Infancy and Childhood. By J. Lewis Smith, M. D., etc.*—1879] Also, speaking in another place [page 647] of artificial food for infants, especially those suffering from intestinal catarrh, he says: "I prefer Liebig's, especially **HORLICK'S** preparation of it."

Report from Bellevue Hospital, New York.

In *The Hospital Gazette* for February 6th. 1879 [page 108] Dr. E. Hochheimer makes a report from BELLEVUE HOSPITAL of a case of Infantile Paralysis, which was followed by an exhausting diarrhœa—Speaking of the treatment, he says: "Her condition continued unchanged for the next three weeks; she was put upon a diet consisting principally of milk, but the diarrhœa persisted in spite of opiates and astringents."

"*Nov. 17th.—Milk was stopped, and she was put upon a diet of HORLICK'S FOOD; after this she began to mend, the diarrhœa became less and finally disappeared; she began to gain flesh, and her general condition was much improved.*"

We also beg to refer, by permission, to the following eminent medical men, who have used our Food extensively in their practice :— **Prof. DeLaskie Miller,** (Rush Medical College); **Prof. Wm. H. Byford,** (Chicago Medical College); **Prof. J. Adams Allen,** (Rush Medical College); **Drs. J. P. Oliver** and **C. P. Putnam,** (Harvard Medical School); **Prof. Gawne,** (Cleveland Medical College); and several hundred others whose testimonial letters are on file in our office.

PRICE, 75 Cents per bottle. **Trial Size, 40 Cents.**

BOYLSTON MEDICAL PRIZE QUESTIONS.

The Boylston Medical Committee, appointed by the President and Fellows of Harvard University, consists of the following physicians:—

D. H. Storer, M.D.	Richard M. Hodges, M.D.
Morrill Wyman, M.D.	Calvin Ellis, M.D.
Henry J. Bigelow, M.D.	Samuel Cabot, M.D.

At the annual meeting, held June 9th, 1879, it was voted that no dissertation worthy of a prize had been offered on either of the subjects proposed for 1879.

The following are the questions proposed for 1880:—

I. Antiseptic Treatment. What are its essential details. How are they best carried out in practical form?

II. Diphtheria. Its causes diagnosis and treatment.

The author of a dissertation considered worthy of a prize, on either of the subjects proposed for 1880, will be entitled to a premium of One Hundred and Fifty Dollars.

Dissertations on the above subjects must be transmitted, postpaid, to D. H. Storer, M.D., 182 Bolyston St., Boston, *on or before the first Wednesday in April*, 1880.

The following are the questions proposed for 1881:—

I. The Effects of Drugs, during Lactation, on either nurse or nurseling.

II. Injuries to the Back, without apparent mechanical lesion, in their surgical and medico-legal aspects.

The author of a dissertation considered worthy of a prize, on either of the subjects proposed for 1881, will be entitled to a premium of Three Hundred Dollars.

Dissertations on these subjects must be transmitted as above, on or before the first Wednesday in April, 1881.

Each dissertation must be accompanied by a sealed packet, on which shall be written some device or sentence, and within which shall be inclosed the author's name and residence. The same device or sentence is to be written on the dissertation to which the packet is attached.

The writer of each dissertation is expected to transmit his communication to the President of the Committee, D. H. Storer, M.D., in a distinct and plain handwriting, *and with the pages bound in book form*, within the time specified.

Any clew by which the authorship of a dissertation is made known to the Committee will debar such dissertation from competition.

Preference will be given to dissertations which exhibit original work.

All unsuccessful dissertations are deposited with the Secretary, from whom they may be obtained, with the sealed packet unopened, if called for within one year after they have been received.

By an order adopted in 1826, the Secretary was directed to publish annually the following votes:—

1st. That the Board do not consider themselves as approving the doctrines contained in any of the dissertations to which premiums may be adjudged.

2d. That in case of publication of a successful dissertation, the author be considered as bound to print the above vote in connection therewith.

BETHESDA WATER.

BELLEVUE, PA., May 21st, 1879.

W. B. HYATT, M.D.,
Marshallville, Wayne Co., Ohio.

DEAR SIR:—Your letter received this morning. Am sorry my friend Dr. S. did not think to tell you to address me at Pittsburg, and your communication would have reached me in a few hours instead of days, as I seldom call at the village P. O.

You will address your orders for BETHESDA WATER to JOSEPH FLEMING, 84 Market Street, Pittsburg, Pa., and they will receive prompt attention. I say this on account of my business acquaintance with Mr. Fleming. I will call on him in the morning, and have him send you pamphlets and any information relative to the matter he may think required.

If my testimony regarding the efficacy of Bethesda Water was required, I could cite several cases of my own personal knowledge. I am convinced that it is a specific in diseases arising from a morbid condition of the kidneys, providing, of course, that the disease has not reached a point beyond the possibility of recovery, as in the case of my late brother, and even then no figures could estimate its value in giving relief from suffering. I have a friend who was under treatment of different physicians all last fall and winter, and apparently getting worse: I persuaded him to stop the treatment and use the "water," and before he had used ten (10) gallons he was much better, and now nearly if not quite well. The doctors would diagnose Phlebitis, but there was a low specific gravity of the urine and other indications of kidney or dropsical affection, which satisfied me that he needed the effects of the "water;" and the results are as stated, and the inflamed vein is getting well, as well as general improved health. It occurs to me, the duty of physicians to investigate such things, and if they contain medicinal virtues, to make it known to suffering humanity instead of standing aloof until men in other walks of life have long recognized and demanded its use. Of course, there are so many new remedies claimed that are worthless, that there is some excuse, yet this Bethesda Water has been in use more than ten (10) years, and comparatively few physicians appear to know anything about its properties. Although you are a stranger to me, allow me to commend you, or any worthy physician who is willing to investigate and test its claimed virtues, and if found, to disseminate the knowledge among their less fortunate fellows. Yours, truly,

W. J. THOMPSON.

P. S.—If you have occasion to address me further, send your letter to Auditor's Office, P. A. R. R., Pittsburg, Pa.

DR. McINTOSH'S

Natural

UTERINE SUPPORTER.

No instrument has ever been placed before the medical profession which has given such universal satisfaction. The combination is such that the Physician is able to meet every indication of Uterine Displacements. Falling Womb, Anteversion, Retroversion and Flexions are overcome by this instrument, where others fail; this is proven by the fact that since its introduction to the Profession it has come into more general use than all other instruments combined.

Among the many reasons which recommend this Supporter to the Physician is its self-adjusting qualities. The Physician after applying it need have no fear that he will be called in haste to remove or readjust it, as is often the case with rings and various pessaries held in position by pressure against the vaginal wall, as the patient can remove it at will and replace it without assistance.

The Abdominal Supporter is a broad morocco leather belt, with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen. The Uterine Support is a cup and stem made of highly polished hard rubber, very light and durable, shaped to fit the neck of the womb, with openings for the secretions to pass out; as shown by the cuts. Cups are made with extended lips, to correct flexions and versions of the womb.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, passing down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic adapt themselves to all the varying positions of the body, and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Anteversion, Retroversions, or any Flexions of the Womb, and is used by the leading Physicians with never failing success, even in the most difficult cases.

Price—to Physicians, $8.00; to Patients, $12.00

Instruments sent by mail, at our risk, on receipt of price with 16 cents added for postage, or by Express, C. O. D.

Member of the American Medical College Association.

FACULTY.

JOHN A. MURPHY, M.D., Professor of Principles and Practice of Medicine and Clinical Medicine.
WM. H. MUSSEY, M.D., Professor of Operative and Clinical Surgery and Surgical Diseases of Women.
E. WILLIAMS, M.D., Professor of Ophthalmology, Aural Surgery and Clinical Ophthalmology.
WM. CLENDENIN, M.D., Professor of Descriptive and Surgical Anatomy.
WM. H. TAYLOR, M.D., Professor of Obstetrics and Clinical Midwifery.
THOMAS H. KEARNEY, M.D., Professor of Principles of Surgery, Surgical Diseases and Clinical Surgery.
J. C. MACKENZIE, M.D., Professor of Physiology and Pathology and Clinical Medicine.
J. F. JUDGE, M.D., Lecturer on Chemistry and Toxicology.
WM. B. DAVIS, M.D., Professor of Materia Medica and Therapeutics.
BYRON STANTON, M.D., Professor of Diseases of Women and Children and Clinical Gnyæcology.
WM. H. DE WITT, M.D., Lecturer on Mental Diseases.
B. P. GOODE, M.D., Lecturer on Diseases of Children.
ROBT. SATTLER, M.D., Lecturer on Diseases of the Eye and Ear.
A. D. BENDER, M.D., Lecturer on Laryngoscopy and Diseases of the Throat, and Demonstrator of Anatomy.
C. A. LE BOUTILLIER, M.D., Lecturer on Surgical Dressings.
CHAS. W. MATHERS, M.D., Demonstrator of Anatomy.
WM. L. DUDLEY, Demonstrator of Chemistry.

THE PRELIMINARY TERM of Lectures will begin September 3d, 1879, and continue one month. This Course will be one of *unusual interest and importance* to physicians as well as students.

THE REGULAR WINTER SESSION will begin October 1st, 1879, and continue five months. This course will consist of Didactic Lectures with Demonstrations, Recitations, Clinical and Special Instruction, involving Physical Manipulations. From five to six Didactic Lectures and Demonstrations are delivered daily, covering the general topics of Medicine and Surgery as taught in all regular medical colleges.

CLINICS.—The Faculty confidently announce that students have, in this college, unsurpassed clinical advantages. *Four Special Clinics* are held daily, in the college building (at which more than six thousand patients are examined annually), viz.: In Practice, Surgery, Gynæcology, Diseases of Children, Ophthalmology and Larnygology, in all of which advanced students have opportunities to make full examinations, especially in *Thoracic Diseases* and *Gynæcology*, and frequently to witness *Obstetric* cases. These clinics are free to students of the college. Two clinical lectures are delivered daily at the Cincinnati Hospital (near the college), during the entire college session.

The College also affords the fullest advantages in *Practical Chemistry*, *Practical Anatomy*, *Practical Physiology* and *Microscopy*.

FEES.

Matriculation fee (annually)	$ 5 00	Demonstrator's Ticket	$5 00
Regular Lecture Term	75 00	Hospital Ticket	5 00
Graduation Fee	25 00	Alumni of this institution free.

[Unguentum Petrolei]

SAMPLES FURNISHED ON APPLICATION.

THE POST-OFFICE LAWS

Forbid anything of an oleaginous nature being sent through the mail.

THEOPHILUS REDWOOD, Ph.D., F. C. S., Professor of Chemistry and Pharmacy to the Pharmaceutical Society of Great Britain, says, in reference to this preparation:—

"UNGUENTUM PETROLEI appears to be obtained from crude Petroleum by fractional distillation and subsequent purification. Products of a similar description have been introduced in pharmacy, and recommended as substitutes for animal or vegetable fats in the preparation of ointments or liniments.

"Among these the UNGUENTUM PETROLEI is distinguished by its having a firmer consistence and a higher melting point, and in these respects it resembles pure lard, from which it differs in that it is entirely free from liability to become rancid or to undergo any chemical change. It has an amber color, and a smooth, jelly-like appearance and is almost wholly free from odor or taste. It is free from, and insoluble in, water. It is very slightly soluble in rectified spirit, but very soluble in ether, in fixed oils and fats. I am of opinion that its characters and properties are such as to render it a valuable adjunct to our Materia Medica."

Dr. TILBURY FOX, London, writes:—"I like the UNGUENTUM PETROLEI very much indeed, and shall not fail to prescribe it."

From "THE LANCET," London, October 20th, 1878.—"Semi-transparent, pale yellow in color, and perfectly free from offensive smell. We consider it a valuable preparation, and hope its use will become as common in England as it is said to be in America."

From "THE MEDICAL TIMES AND GAZETTE," London, October 20th, 1878.—"The substance introduced under the name of UNGUENTUM PETROLEI is of about the consistence of good lard, has no smell, keeps any length of time, apparently without becoming rancid, and may be exposed to any kind of atmosphere without undergoing chemical change. It has long been, we understand, in use in America, where it enjoys a wide-spread popularity; and it will, we doubt not, come into extensive use here also, as a vehicle for making ointments, as a demulcent in various diseases of the skin, and as a lubricant."

Sunnyside Medical Retreat

For Mental and Nervous Diseases, Inebriety and the Opium Habit,

FORT WASHINGTON, NEW YORK CITY.

This home, situated on the banks of the Hudson, under the management of Dr. Edward C. Mann, late Medical Superintendent of the New York State Emigrant Insane Asylum, receives cases of either sex affected with mental disorders, Inebriety or the Opium habit. The beauty of location and surroundings, handsomely furnished apartments, and the attentions and comforts of home life, all combine to make Sunnyside an attractive and popular private retreat. Applications may be made to Dr. Mann, either by mail or personally, at Fort Washington. Twelve trains daily from Hudson River Depot, 30th St., and 10th Ave. Broadway and 23d St. line of stages run direct to depot. The profession respectfully invited to call, and cordially welcomed. 1152-1y

Starling Medical College,

COLUMBUS, OHIO.

The Thirty-third Session of Starling Medical College will begin October 2, 1879, and continue until March, 1880. It will be preceded by a preliminary course beginning September 3, 1879. Extensive additions have recently been made to the Museum and other teaching facilities of the College.

FACULTY.—F. Carter, M.D., Dean; H. G. Landis, M.D.; J. H. Pooley, M.D.; S. Loving, M.D.; J. M. Wheaton, M.D.; E. B. Fullerton, M.D.; W. J. Conklin, M.D. (of Dayton); Alex. Dunlap, M.D.; Otto Frankenburg, M.D.

SESSIONS OF 1879-'80

FACULTY.

JAMES F. NOYES, M.D.,
Emeritus Professor of Ophthalmology and Otology.

THEO. A. McGRAW, M.D., President,
Professor of Principles and Practice of Surgery and Clinical Surgery.

GEORGE P. ANDREWS, M.D.,
Professor of Principles and Practice of Medicine and Clinical Medicine.

C. B. GILBERT, M.D.,
Professor of Obstetrics, and Diseases of Women and Children.

N. W. WEBBER, M.D.,
Professor of General and Descriptive Anatomy, and Clinical Surgery.

SAMUEL P. DUFFIELD, PH.D., M.D.,
Professor of Toxicology and Medical Jurisprudence.

ALBERT B. LYONS, M.D.,
Professor of Chemistry and Director of the Chemical Laboratory.

LEARTUS CONNOR, M.D., Secretary,
Professor of Physiology and Diseases of the Eye and Ear.

H. O. WALKER, M.D.,
Lecturer on Anatomy and Genito-Urinary Diseases.

E. L. SHURLY, M.D.,
Lecturer on Materia Medica, Therapeutics and Clinical Laryngology.

HAL. C. WYMAN, M.D.,
Lecturer on Physiology.

J. G. JOHNSON, M.D.,
Lecturer on Diseases of Mind and Nervous System.

J. H. CARSTENS, M.D.,
Lecturer on Clinical Medicine.

F. A. SPALDING, M.D.,
Lecturer on Diseases of the Skin.

C. C. YEMANS, M.D.,
Lecturer on Chemistry.

E. A. CHAPOTON, M.D.,
Demonstrator of Practical Physiology and Instructor in Anatomy and Surgery.

J. W. ROBERTSON, M.D.,
Demonstrator of Practical Microscopy.

DAVID INGLIS, M.D.,
Instructor in Chemistry and Physiology.

E. B. WARD, M.D.,
Curator of Museum and Librarian.

The Collegiate Year is divided into three sessions.

Preliminary Session opens Wednesday, September 3d, 1879, and closes September 30th. The Clinics are held and the Lectures delivered by the Professors of the regular Faculty, and in the same order and frequency as during the Winter Term. Opportunity is given to dissect or work in the Chemical and Physiological Laboratories.

The Regular Session opens Wednesday, October 1st, 1879, and closes March 2d, 1880. During this term all the branches of *General Medicine* and *Surgery*, both scientific and practical, are taught with care and thoroughness. All students are daily examined on the subjects of the lectures and on their dissecting and laboratory work.

Senior students have *daily practice* in the *art of examining patients*, in forming their own diagnosis, prognosis and treatment. As this is done under the direction of the professor holding each clinic, and in the presence of the class, it constitutes an invaluable course of training.

The Recitation Session begins March 10th, 1880, and closes June 23d, 1880. Daily during this term will be held recitations for both Seniors and Juniors, and one or two clinics and a lecture.

The recitations will embrace a thorough drill upon the general subjects of the Regular Session, viz.: Anatomy, Chemistry, Physiology, Practice of Medicine, Materia Medica and Therapeutics, Surgery, Obstetrics, Diseases of Women and Children.

Though the Recitation and Preliminary Sessions are optional, it is hoped that all who can will avail themselves of their manifest advantages in commencing the study of medicine, or in supplementing the regular winter course.

Three Hospitals—Harper's, St. Mary's and St. Luke's—with two large free dispensaries, afford an abundance of clinical material for illustrative and practical teaching.

All lectures are delivered on Hospital grounds. The *peculiar feature* of this school is the *intimate union* between its *laboratory, clinical* and *didactic* instruction.

Fees.—For Preliminary and Regular Sessions: Matriculation, $5. Hospital Fees, $10. Lecture Fees, $40. Graduation, $25. Lecture Fees to third course students, $25.

For the Recitation Term the Lecture Fees are $10, to those who attend the other courses. All others are required to matriculate and take out the Hospital tickets.

All fees payable in advance to the *Secretary*.

Announcement and Catalogue, or any further information which may be desired, can be promptly obtained by addressing

LEARTUS CONNOR, M.D., Secretary,
92 Cass Street, Detroit.

1165-1190

SPECIAL FACTS CONCERNING

BELLADONNA PLASTER

IN RUBBER COMBINATION.

PREPARED BY

SEABURY & JOHNSON.

In undertaking the manufacture of Medicinal Plasters we had but one object in view—THE IMPROVEMENT OF ALL KINDS OF PLASTERS. Among the various plasters manufactured by us was BELLADONNA PLASTER. This article met with a larger demand than some of the others, acquired a reputation among the best druggists, and received the confidence of the profession. Its large sale interfered with rival manufacturers, and continuous efforts have been made on their part to prejudice physicians against it.

As these attacks have been of late more malicious than usual, we have deemed it advisable, in self-defence, and in order to place our article fairly before the practitioner, to assign reasons why we consider it the most thoroughly reliable preparation ever offered the medical profession. First, it is a combination of the Alcoholic Extract of Belladonna only, with purified rubber, and thus possesses all of the advantages of the rubber base, being pliable, convenient of application, and not subject to the deteriorating influence of age, as is the case when any other base is used. Secondly, it is freed from all irritative properties. Thirdly, it is more adhesive than any other plasters. Fourthly, we believe it to be as perfect, in every respect, as it is possible to make a Belladonna plaster.

ENGLISH EXTRACTS—WHY WE DO NOT EMPLOY THEM.

Imported English Extracts are prepared from the Inspissated Juice of the leaf, while our pharmacopœia formula is treated by Alcohol. The active principle of Belladonna (Atropia) is only partially obtained by Inspissation. The employment of Alcoholic or Hydro-Alcoholic Solvents completely exhausts the entire strength of the drug.

The value of both preparations is clearly presented in an able treatise published in the *American Journal of Pharmacy*, April 1876, page 145. Our own investigations are substantially identical :—

TABLE OF RESULTS,

	Test solution requisite for 100 cc. of Ext. Solution.	Percentage of Atropia in Extract.
EXT. BELLADONNÆ ALCOH. U. S. P.	*17·732*	*2·571*
GEO. ALLEN & CO., English	*9·73*	*1·411*
*HERRINGS & CO., " *	*8·133*	*1·179*
E. MERCK, Germany (aqueous extract), made 1869	*1·9*	*·275*

This analysis clearly establishes the fact that the **Alcoholic Extract of Belladonna of the U. S. P. averages over twice the strength of English Extracts,** and should, therefore, be preferred in all cases where a reliable article is desired. Inspissated and Aqueous Extracts deteriorate, while Alcoholic remain stable.

Therefore the assumption of pretentious manufacturers, that the English Extracts are the superior preparations, must be based on a former supposition rather than present facts. The following analysis substantiates our claim regarding English Extracts.

ANALYSIS OF BELLADONNA PLASTERS, BY PROF. R. OGDEN DOREMUS.

"BELLEVUE HOSPITAL COLLEGE, New York, Sept. 7, 1878.

"GENTLEMEN—I obtained from Messrs. W. H. Schieffelin & Co., of this city, samples of Belladonna Plasters prepared by Grosvenor & Richards, Boston ; Mitchell Novelty Plaster Works ; Seabury & Johnson, New York and London. I have examined these varieties for the purpose of determining which possesses the largest quantity of Atropine. I employed equal surfaces of each, and *my analysis demonstrated that* SEABURY & JOHNSON'S *contains the greatest proportion* of the active principle of Belladonna. "R. OGDEN DOREMUS, M.D., L.L.D."

Belladonna Plaster, prepared by Seabury & Johnson, is packed in elegant tin cases, which contain 1 yard each, and can be obtained of almost any druggist throughout the United States and Canada, or will be furnished direct by mail. Samples sent on application.

TROMMER'S EXTRACT OF MALT.

The rapidly increasing demand for our IMPROVED EXTRACT OF MALT, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantities; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or moulding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expense of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops**, viz: MALT SUGAR, DEXTRINE, DIASTASE, RESIN and BITTER of HOPS, PHOSPHATES of LIME and MAGNESIA, and ALKALINE SALTS.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:—
Malt Sugar 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712. Alkalies .377; Water, 25.7; Total, 99.958.
In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article.

Yours truly, SILAS H. DOUGLAS,
Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt contains a larger quantity of the active properties of Malt than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ pounds of the Extract.

Our preparations of Malt are for sale by druggists generally, throughout the United States and Canada, at the following prices:—

EXTRACT OF MALT,			*With Hops (Plain)*,	$1.00
"	"	"	*Pyrophosphate of Iron (Ferrated)*,	1.00
"	"	"	*Cod Liver Oil*,	1.00

DR. L. D. McINTOSH'S
Electric or Galvanic Belt.

If this new combination could be seen and tested by the medical profession, few, if any, words would be needed from us in its favor, for it combines utility with simplicity in such perfection that seeing it is convincing proof of its great value. The medical profession to-day acknowledge, almost universally, Electro-Therapeutics.

This combination is composed of sixteen cells, placed in pockets on a belt. Each cell is made of hard vulcanized rubber, lined with a copper cell, which constitutes the negative plate. The rubber coating perfectly insulates each cell. The positive plates are of zinc, wrapped in a porous material, to absorb the exciting fluid and prevent contact with the copper, and permit the current to pass from the copper to the zinc.

Thus the cells are charged without wetting the belt, and the discomfort following to the patient. A wire is soldered to each zinc plate, which connects with the copper cell by entering a tube on its side, thus rendering the belt pliable.

The McIntosh Electric Belt is superior to all others for the following reasons:—

It is composed of sixteen cells—thus giving a powerful current. A current selector is so arranged that one or more cells can be used at pleasure. There is not anything irritating about the Belt, as is the case with all other contrivances where the metal used is wet with weak acids and placed next to the skin. The electrodes are pieces of metal covered similar to ordinary battery electrodes, and connected with the cells by connecting cords. By this arrangement, a current from the Belt can be applied, to produce a general or local effect.

Physicians who have used this belt in their practice do not hesitate to recommend it to the profession.

Our pamphlet on Medical Electricity sent free on application. Address

HORSFORD'S
Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges.

DEXTRO-QUININE.

Equal to Sulphate of Quinine IN THE SAME DOSE——rarely causes, even in large doses, any Cerebral distress or irritability of the Stomach——less than one-half as costly as Sulphate of Quinine.

From recent letters recording CLINICAL EVIDENCE OF THE VALUE OF DEXTRO-QUININE, we extract the following:—

Living in a highly malarious district, and having long felt the want of a reliable substitute for Quinine, I resolved to give your preparation of *Dextro-Quinine* a thorough trial. To show what success I have had by the above preparation, I append the following cases:—

CASE 1.—Mrs. T., a washerwoman, consulted me in November, for "*Chills.*" By inquiry I learned that she had had a paroxysm every day for about two months. She had taken *Sulphate of Quinia* and *Cinchonidia*, without effect. I prescribed the following, in pill form: R.—Dextro-Quinine, gm. 1.33, Ext. Aconite Rad., gm. .066, made into three pills, which she took during the night, which interrupted the paroxysm of the following day, as she informed me when I again saw her. I subsequently prescribed a repetition of the above prescription, "to make assurance doubly sure," and she has since had no return of the *Chills.*

CASE II was that of my brother. Had *Remittent fever* last August, since which time he has had regular exacerbations of fever, preceded by a well marked *chill*, every other day. He took *Sulphate of Quinia, pro re nata*, without interrupting the paroxysms. Having had such excellent results from Dextro-Quinine in previous cases, I prescribed the following, in pill form, with the most happy result: R.—Dextro-Quinine, gm. 2.00, Ext. Hyoscyamus, gm. 23. The mass was made into ten pills, and one given every three hours in stage of apyrexia. He has had no return of the paroxysms since.

CASE III.—Mrs. H., aged about 50 years, was taken with Remittent fever. She informed me that she had had an attack of the above fever every summer or autumn for three or four years, during which time she was usually sick from two to three weeks. I prescribed, among other things, R.—Dextro-Quinine, gm., 1.33, Ext. Hyoscyamus, gm. 20, made into capsules, No. vi, one to be taken every three hours. Prescription refilled, and in a week's time she was convalescent.

K&M
One Ounce
DEXTRO-QUININE
"K&M."
COMPOSITION C_{20}. H_{46}. K_4. O_2.
DEXTRO-GYRATE WITH POLARIZED LIGHT.
This article is prepared from commercial purified Chinoidine and consists of the Amorphous Quinine of Liebig or the Diconchinia of Hesse. It is equal to Sulphate of Quinine in the same dose, while in price it is less than one half as costly.
MANUFACTURED BY
KEASBEY & MATTISON.
CHEMISTS.
PHILADELPHIA, U. S. A.

Price, $1.50 per Ounce.

The above is a synopsis of three cases in which I have used Dextro-Quinine, which I consider typical of the types they represent. I have used the above treatment in twelve or thirteen cases with uniform success. My experience, I think, fully accords with that of other physicians of this city who have given it a thorough trial. I usually prescribe Dextro-Quinine in doses of gm. 33 to an adult, combined either with extracts of Hyoscyamus, Aconite, or Pulvis Ipecacuanhæ Comp. From gm. 2.00 to gm. 2.66, combined with one of the above drugs, will usually interrupt a paroxysm of intermittent fever. There are no nervous phenomena, such as *Tinnitus Aurium*, etc., manifested, as there are by the use of Sulphate of Quinia. In conclusion, I will say that Dextro-Quinine is a valuable substitute for Sulphate Quinine, and besides its cheapness is a great consideration to the people, as it is within the reach of all.

I am yours, etc.,
C. C. DUNLAP, M.D.,
Chillicothe, Ohio.

Mr. John Nipgen, a leading druggist of Chillicothe, Ohio (a highly malarious district), says, in a recent letter to us, "*Dextro-Quinine* has almost superseded the use of Quinine in this city and vicinity. I get at least three prescriptions for *Dextro-Quinine* to one for Quinine Sulphate."

CASE IV.—Mrs S., æt. 22, married, no children, brunette, suffering from intermittent fever; first paroxysm Nov. 20th, 6 A. M.; again at 4 P. M. Prescribed Cinchonidia sulphate, grs. xxx, chart No. v. One to be taken every two hours.

Nov. 21st. Return of paroxysm at 6 A. M. and 4 P. M. Gave Cinchonidia sulphate, grs. xlv, chart No. v. One to be taken every two hours.

Nov. 22. Return of paroxysm at same time as on preceding days. Prescribed Dextro-Quinine, grs. xx, chart No. v. One to be taken every two hours. No return of chill since that date, and highly pleased with my experience.

N. H. MANRING, M.D.,
Rigdon, Ind.

Where physicians cannot be supplied by their local druggist, we will forward this article by mail, upon receipt of price. $1.60 per ounce, by mail.

Samples for clinical use furnished free, on application to the manufacturers,

KEASBEY & MATTISON, Chemists,

332 North Front Street, Philadelphia.

BE CAREFUL TO SPECIFY McKESSON & ROBBINS'.

SPECIFY McKESSON & ROBBINS' Oval Shape Compressed Coating.

IMPORTANT TO PHYSICIANS!

The fact that Sulphate of Quinine is only soluble in over 700 parts of water is not generally known, or if known is not usually considered, except in prescriptions, when this difficulty is overcome by the addition of Acid; and the further fact that **Bi-Sulphate of Quinine** is soluble in **only 10 parts of water** is as little appreciated.

McKesson & Robbins have paid much attention to the subject of putting Quinine into Pills, in a condition approaching that of a solution, and have at last succeeded in their **BI-SULPHATE OF QUININE PILLS,** and offer the same to the profession, confident that they will stand any test for solubility and prompt action. Physicians will please always specify **McK. & R. Bi-Sulph. Quinine Pills,** and they will not be disappointed in results.

Note.--With no reference to *respectable* druggists, we would say that cases have come to our knowledge and have been noted, where other pills have been substituted on prescriptions for ours.

POWDERED PURIFIED CHINOIDINE.

Containing all the Non-Crystalizable Alkaloids of Cinchona Bark.

Similar preparations have been lately offered in market AT HIGH PRICES under different fancy appellations, and claims made for the same as of equal efficiency with Quinine.

As a great demand exists for a cheap anti-malarial remedy, we introduce this preparation at low figures; and, in order that the profession may judge practically of its merits, will forward a sample to any physician's address, or mail one ounce upon receipt of FIFTY CENTS.

Yours respectfully,

McKESSON & ROBBINS,

Wholesale Druggists and Manufacturing Chemists,

91 FULTON ST., NEW YORK.

GRANULATED EFFERVESCENT SALTS

PREPARED BY

WILLIAM R. WARNER & Co.,

CHEMISTS,

PHILADELPHIA.

Granulated Effervescent

VICHY SALT.

(Grand Grille.)

A large teaspoonful dissolved in half a glass of water, forms a grateful and refreshing draught, identical with the natural water. Per dozen, $4.00

Granulated Effervescent

SELTZER SALT.

A tablespoonful to half a glass of water forms a grateful and refreshing saline draught, identical with the natural water. Per Dozen, $4.00

Granulated Effervescent

SEIDLITZ MIXTURE.

(Seidlitz Powder, U. S. P.)

An excellent aperient and refrigerant, very acceptable to the stomach. Per doz. $4.00

Dose.—One tablespoonful in a glass of water.

Granulated Effervescent

NITRATE of POTASSIUM.

A dessert-spoonful in glass of water makes an excellent mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

CITRATE OF POTASSIUM.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $5.00

Granulated Effervescent

Bi-Carbonate of Potassium.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

Pepsin, Bismuth and Strychnia.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin, soluble Citrate of Bismuth, and the sixtieth grain of Citrate of Strychnia. Per dozen, $10.00

Granulated Effervescent

PEPSIN AND BISMUTH.

Each drachm or heaping teaspoonful concains the dose of Saccharated Pepsin and soluble Citrate of Bismuth. Per doz. $9.00

Granulated Effervescent

CITRATE OF MAGNESIA.

(Pleasant and Efficient.)

For a purgative effect, take two or more tablespoonfuls added to a small glass of water, and drink while effervescing. As a laxative, one or more tablespoonfuls taken in the same manner. One or two teaspoonfuls in sweetened water, produces a delightful, cooling drink in summer. Per dozen, $4.00

Granulated Effervescent

CITRATE LITHIA.

Each drachm or teaspoonful contains four grains of the chemically pure salt. Valuable in Rheumatic, Gouty and Analogous disorders. Per dozen, $10.00

Granulated Effervescent

KISSINGEN SALT.

A large teaspoonful dissolved in half a glass of water, forms an agreeable and refreshing draught identical with the natural water. Per dozen, $4.00

Granulated Effervescent

CRAB ORCHARD SALT.

Prepared from the exact analysis of the purified natural salt, obtained from the Crab Orchard Spring, Ky.

A tablespoonful in half a glass of water forms a grateful effervescing draught, producing the effect of the natural water. Per dozen, $4.00

Granulated Effervescent

OXALATE OF CERIUM.

Each drachm or large teaspoonful contains two grains of Oxalate of Cerium. Per dozen, $5.00

Granulated Effervescent

CITRATE CAFFEINE.

A dessert-spoonful containing one grain of Citrate of Caffeine should be given for sick headache, every hour or two before and during the paroxysms. Per dozen, $10.00

Physicians will please specify Warner & Co.—Equal to best English.

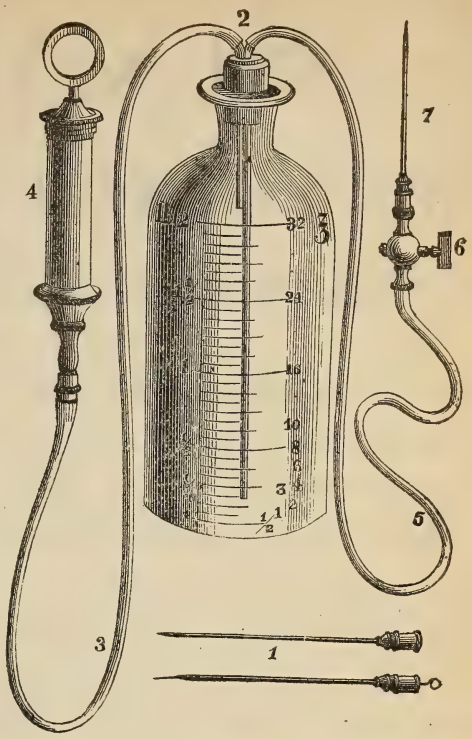
CASWELL, HAZARD & CO.,

NEW YORK.



NEW ASPIRATOR, by Dr. Potain, Paris.

APOLLINARIS WATER.

HIGHLY EFFERVESCENT.

Approved by the Academy of Medicine of France, and its Sale in France as a Natural Mineral Water authorized by Special Decree of the French Government.

"The Exquisite Apollinaris."—Dr. J. Milner Fothergill. "Queen of Table Waters."—Lon. Med. Record.

APOLLINARIS WATER has been the subject of the most favorable reports from Professors Fordyce Barker, Ogden Doremus, Austin Flint, W. A. Hammond, Loomis, F. N. Otis, E. R. Peaslee, Sayre, Marion Sims, James R. Wood, New York, etc., etc.

APOLLINARIS	Used habitually as a table water, its pleasant taste and richness in pure carbonic acid favorably distinguish it from the other similar mineral waters.—Prof. Dr. VIRCHOW, *Member of the German Parliament, and Professor University of Berlin.*
APOLLINARIS	EXCEPTIONALLY VALUABLE and PLEASANT as a table-water in HYGIENIC as well as DIETETIC respects; maintains its FRESHNESS on the PALATE when constantly used.—Prof. Dr. OSCAR LIEBREICH, Berlin.
APOLLINARIS	I have for many years always obtained the best success with this water in cases of severe DISORDERS of the DIGESTION; in PHTHISIS, during CONVALESCENCE from severe Illnesses, after TYPHUS PNEUMONIA, ARTICULAR RHEUMATISM, and also in DIPHTHERIA, and in the various other diseases in which it was necessary to produce a TONIC EFFECT upon the STOMACH and the DIGESTION. I have of late almost EXCLUSIVELY EMPLOYED IT.—Prof. Dr. OERTEL, Munich, *Author of Treatise on Diphtheria, &c., Ziemssen's Cyclopædia.*
APOLLINARIS	REFRESHING, PROMOTES DIGESTION, and is especially to be recommended as an adjuvant in the following morbid conditions: DYSPEPSIA characterized by ACIDITY of the STOMACH, GASTRO-ENTERALGIA, tendency to GALL-STONES, GOUTY conditions, CATARRHAL affections of the GENITO-URINARY MUCOUS MEMBRANE, and UTERINE CONGESTION leading to CATAMENIAL HEMORRHAGE. The habit of drinking Apollinaris Water has SAVED many from TYPHOID Fever, while their COMPANIONS drinking COMMON WATER were INFECTED.—Dr. HERMANN WEBER, *Fellow of the Royal College of Physicians, London, &c., &c.*

Further Testimonials from numerous authorities, including Professors Frankland, F.R.S., Lond.; Odling, F.R.S., Oxford; A. W. Hoffmann, F.R.S., Privy Councillor, Berlin; Kekulé, Rector of University of Bonn; Professors Ditterich, Munich; Nussbaum, Munich; Varrentrapp, Frankfort; T. K. Chambers, Physician to the Prince of Wales; Peter Hood, M.D.; Peter Squire, F.L.S., Chemist to the Queen, and others; Professors Drs. Labbé, Fauvel, A. Latour, L. Championnière, Constantin James, Lutaud, &c., France, and many others, have been published and may be obtained on application to

F. DE BARY & CO., 41 & 43 Warren St., New York.

Apollinaris Water may be had of all Wine Merchants, Grocers, Druggists, and Mineral Water dealers throughout the United States.

SINAPISM.

AMERICAN MUSTARD LEAVES,

—OR—

IMPROVED MUSTARD POULTICE.

"AMERICAN" MUSTARD LEAVES promptly meet the emergencies indicating the use of Mustard. They have the important advantage of being prepared with Pure Mustard, "Sinapsis Nigra," while the ordinary ground Mustard of commerce is generally adulterated and unreliable.

The "AMERICAN" MUSTARD LEAVES are an unalterable revulsive, and can always be depended upon. They save the sick, and those attending them, the inconvenience of preparing a poultice. Their certainty of action and great convenience, as well as their cheapness, entitle them to high favor.

Mustard being one of the most useful of all external applications, the advantage of a Mustard Plaster—which needs only to be dipped into water to be ready for use—commends itself to physician, nurse, and patient.

MAILED UPON RECEIPT OF PRICE.

In boxes of 12-inch lengths, 25 cents each;—in tin boxes of 24-inch lengths, 50 cents each; in boxes of 2-yard lengths (on reel), $1.00 each.

CAN BE CUT WITH KNIFE OR SCISSORS TO ANY DESIRED SIZE OR SHAPE.

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION,

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil, by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM, instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat, in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more digestible solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatized Cod-Liver Oil, the active digestive principle of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Pancreatine effects the digestion and assimilation of Cod-Liver Oil and Fat, as well as Food generally. This palatable and popular remedy is therefore invaluable to PATIENTS WHO ARE UNABLE TO DIGEST COD-LIVER OIL, and who are thus deprived of its nourishing and invigorating properties.

Pancreatine Wine. An excellent vehicle for taking Cod-Liver Oil and promoting the digestion of it.

TO THE MEDICAL PROFESSION.

LACTOPEPTINE,

The most important remedial agent ever presented to the Profession for Indigestion, Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all diseases arising from Imperfect Nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase, or Veg. Ptyalin, Lactic and Hydrochloric Acids, in Combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk.....40 ounces.	Veg. Ptyalin or Diastase.....4 drachms.
Pepsin..... 8 ounces.	Lactic Acid.....5 fl. drachms.
Pancreatine..... 6 ounces.	Hydrochloric Acid.....5 fl. drachms.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its almost universal adoption by the Profession is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned having tested LACTOPEPTINE, recommend it to the Profession:—

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

LEWIS A. SAYRE, M.D.,
Professor of Orthopædic Surgery and Clinical Surgery, Bellevue Hospital Medical College.

F. LE ROY SATTERLEE, M.D., PH.D.,
Professor of Chem., Mat. Med. and Therap. in the N. Y. College of Dent.; Prof. of Chem. and Hygiene in the Am. Vet. College, etc., etc.

SAMUEL R. PERCY, M.D.,
Professor Materia Medica, New York Medical College.

A. VAN DEVEER, M.D.,
ALBANY, N. Y., June 8th, 1878.
Prof. of the Prin. and Prac. of Surg., Albany Med. Col.; Surg. Albany and St. Peter's Hospitals.
"I have given LACTOPEPTINE a good thorough trial, and have been greatly pleased with the excellent results that have followed its administration."

JOHN H. PACKARD, M.D.,
PHILADELPHIA, PA., May 30th, 1878.
Pres't Phila. Co. Obstet. Society; Surg. Episcopal and Women's Hospitals.
"I have found great satisfaction in the use of LACTOPEPTINE, and have ordered it frequently in cases of Dyspepsia, especially where there is want of tone and defective secretion."

JAS. AITKEN MEIGS, M.D.,
PHILADELPHIA, June 20th, 1878.
Prof. of the Institutes of Med. and Med. Juris., Jeff. Medical College; Phy. to Penn. Hos.
"I have used LACTOPEPTINE with very good effect in a number of cases of Dyspepsia."

W. W. DAWSON, M.D.,
CINCINNATI, O., June 21st, 1878.
Prof. Prin. and Prac. Surg., Med. Col. of Ohio; Surg. to Good Samaritan Hospital.
"I have used LACTOPEPTINE with great advantage in cases of feeble digestion."

ALBERT F. A. KING, M.D.,
WASHINGTON, D. C., June 19th, 1878.
Prof. of Obstetrics, University of Vermont.
"I have used LACTOPEPTINE both in hospital and private practice, and have found it to answer fully the purposes for which it is recommended. As an immediate aid to the digestive function, I know of no remedy which acts more directly."

D. W. YANDELL, M.D.,
LOUISVILLE, KY., March 7th, 1878.
Prof. of the Science and Art of Surg. and Clinical Surg., University of Louisville.
"I have made much use of LACTOPEPTINE, and take great pleasure in stating that it has rarely disappointed me. I shall, of course, continue to prescribe it."

ROBT. BATTEY, M.D.,
ROME, GA., June 8th, 1878.
Emeritus Prof. of Obstetrics, Atlanta Med. College, and Ex-Pres. Med. Association of Ga.
"I have used LACTOPEPTINE in a case of Dyspepsia with satisfaction. I think well of it."

CLAUDE H. MASTIN, M.D., LL.D.,
MOBILE, ALA., June 8th, 1878.
"I consider LACTOPEPTINE the very best preparation of the kind which I have ever employed, and for patients with feeble digestion I know of nothing that is equal to it."

Prof. H. C. BARTLETT, PH.D., F.C.S.,
LONDON, ENG., February 22d, 1876.
"I find the preparation of LACTOPEPTINE contains within itself all the principles required to promote a healthy digestion.

PRICE LIST.

LACTOPEPTINE (in oz. bottles).....per oz.	$1.00
" (" ").....per doz.	10.00
" (in ½ lb ").....per lb.	12.00

We also prepare the various Elixirs and Syrups, in combination with Lactopeptine.

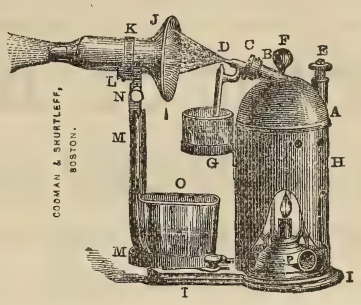
CODMAN & SHURTLEFF'S

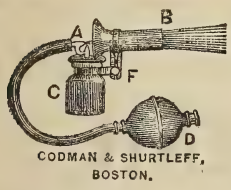
ATOMIZING APPARATUS.

PRICES REDUCED.

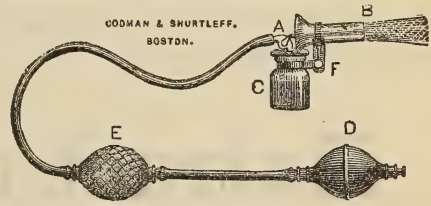


THE COMPLETE STEAM ATOMIZER. (Patented March 24, 1868.)

All its joints are hard-soldered.
Every one is tested by hydrostatic pressure, to more than one hundred pounds to the square inch.
It cannot be injured by exhaustion of water, or any attainable pressure, and will last for many years.
It does not throw spirts of hot water, is convenient, durable, portable, compact, and cheap, in the best sense of the word. Price $5.00. Postage 59c.
Brass parts, nickel-plated, additional, $2.00.
Neatly made, strong Black Walnut Box, with convenient Handle, additional, $2.50. Postage 44c.



THE BOSTON ATOMIZER. (Patented.)



SHURTLEFF'S ATOMIZING APPARATUS. (Patented.)

The most desirable Hand Apparatus. Rubber warranted of the very best quality. Valves imperishable, every one carefully fitted, and will work perfectly in all positions. Price $3.50.
The Bulbs are adapted to all the Atomizing Tubes made by us.
Each of the above Apparatus is supplied with two carefully-made annealed glass Atomizing Tubes, and accompanied with directions for use. Each Apparatus is carefully packed for transportation, and warranted perfect.

The Antiseptic Atomizer		*$15.00, $25.00, $45.00, and $50.00*

13 and 15 TREMONT STREET, BOSTON.

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt. and all its combinations.

Extract of Malt,

WITH COD-LIVER OIL,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO,

(See Transactions of American Medical Association, for 1876, page 176.)

Is presented to the medical profession as an efficient, palatable and very stable combination, consisting of equal parts of the ***Extract of Canadian Barley Malt*** and the best quality of genuine ***Norwegian Cod-liver Oil.*** Many patients take this preparation who cannot take the oil in any other form. It may be employed in all cases where Cod-liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

Extract of Malt,

WITH COD-LIVER OIL AND PHOSPHORUS,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod-liver Oil, Phosphorus being added in the proportion of $\frac{1}{100}$ grain to the dose, and so combined as to be perfectly protected from oxidation. The ***Trommer Extract of Malt Company*** prepare this combination agreeably to the suggestion of ***Dr. Wilson Fox.*** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

Extract of Malt,

WITH COD-LIVER OIL AND IODIDE OF IRON

added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod-liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians, referring to it in terms of high praise.

1090-1115eow

BARON LEIBIG, the greatest authority on Infant Diet, states that the majority of children who die under one year of age, do so from the effects of improper food, or from the improper administration of the food.

HORLICK'S FOOD.

A Concentrated Extract, prepared according to the Formula of Baron Liebig, and, unlike other Foods,

IS NOT FARINACEOUS.

It is acknowledged by Physicians to be the best Food

For Infants, Dyspeptics and Invalids.

Prof. J. Lewis Smith Says,

Speaking of **HORLICK'S FOOD:** "Being carefully prepared, according to Liebig's Formula, by Chemists fully competent, it possesses certain advantages, such as quick and easy preparation and a pleasant flavor, and is therefore highly esteemed by those who have used it." [*Page* 58 *of the fourth edition of a Treatise on Diseases of Infancy and Childhood. By J. Lewis Smith, M. D., etc.*—1879] Also, speaking in another place [page 647] of artificial food for infants, especially those suffering from intestinal catarrh, he says: "I prefer Liebig's, especially **HORLICK'S** preparation of it."

Report from Bellevue Hospital, New York.

In *The Hospital Gazette* for February 6th. 1879 [page 108] Dr. E. Hochheimer makes a report from BELLEVUE HOSPITAL of a case of Infantile Paralysis, which was followed by an exhausting diarrhœa—Speaking of the treatment, he says: "Her condition continued unchanged for the next three weeks; she was put upon a diet consisting principally of milk, but the diarrhœa persisted in spite of opiates and astringents."

"*Nov. 17th.—Milk was stopped, and she was put upon a diet of HORLICK'S FOOD; after this she began to mend, the diarrhœa became less and finally disappeared; she began to gain flesh, and her general condition was much improved.*"

We also beg to refer, by permission, to the following eminent medical men, who have used our Food extensively in their practice:— **Prof. DeLaskie Miller,** (Rush Medical College); **Prof. Wm. H. Byford,** (Chicago Medical College); **Prof. J. Adams Allen,** (Rush Medical College); **Drs. J. P. Oliver** and **C. P. Putnam,** (Harvard Medical School); **Prof. Gawne,** (Cleveland Medical College); and several hundred others whose testimonial letters are on file in our office.

PRICE, 75 Cents per bottle. Trial Size, 40 Cents.

Professor of Histology.

R. L. REA, M.D.,
Professor of Anatomy.

HENRY GRADLE, M.D.,
Lecturer upon Physiology.

ROSWELL PARK, A.M., M.D.,
Demonstrator of Anatomy and Assistant to the Chair of Anatomy.

GRADED COURSE OF INSTRUCTION.

A graded system of medical instruction was adopted at the organization of this College, twenty years ago, and for twelve years it was the only representative of a classified course in this country. The recommendation of this method of teaching by two Medical College Conventions, by the American Medical Association, and by various State Medical Societies; and its more recent adoption by a number of other colleges, including some of the most prominent ones in the land; and its very general approval by the profession at large, afford gratifying evidence that this new departure was a movement in the right direction.

REQUIREMENTS FOR ADMISSION.

All applicants for admission are required to present evidence of graduation in some literary college, or certificates of attendance upon some scientific school or academy. If the applicant have neither diploma nor certificate, he must sustain a satisfactory examination as to his literary qualifications.

ADVANCED STANDING.

Students who have read medicine for one full year may enter upon the *Middle Course*, by sustaining satisfactory examinations upon studies embraced in the Junior Course.

Students who have read medicine for two years, including attendance upon one full course of lectures in some recognized medical college, may enter the *Senior Course*, by sustaining examinations upon the subjects embraced in the Junior and Middle Courses.

THE COLLEGE TERM.

A Preliminary course of Didactic and Clinical instruction, introductory to the general course, commences September 16th and continues till the commencement of the regular Session.

THE REGULAR COURSE of lectures commences Tuesday, September 30th, and will continue until March 30th, at which time the usual Commencement exercises will be held.

THE PRACTITIONERS' COURSE,

Designed for practitioners, will commence March 31st, 1880, following the Commencement, and will continue till April 28th. This special course is arranged to meet a very general want, and will afford special advantages for a *rapid*, yet *thorough*, practical review of the most important subjects in medicine and surgery.

CLINICAL ADVANTAGES.

Mercy Hospital, with its very perfect appointments; the Dispensary and the College clinics, offer an abundance of clinical material in every department of Medical and Surgical teaching. Over fourteen thousand patients were treated here during the *last year*.

In the Hospital every Senior student serves as dresser for an allotted term in the surgical wards, and receives a certificate to that effect.

Every Senior student has personal charge of one or more cases of obstetrics, under the immediate supervision of the Professor of obstetrics.

In the Gynecological Department, where large numbers of females apply for local treatment, each Senior student is trained by the Professor in the minute details of examination and treatment of the medical and surgical diseases of women.

PHYSIOLOGICAL LABORATORY.

Aided by the generous contributions of its alumni, this College is developing a PHYSIOLOGICAL LABORATORY, which will be opened for instruction during the present year.

PRIZES

Will be given by the Dean, for the best Thesis; by the Professor of Anatomy, a First Prize to the best Anatomist—open to all classes; Second Prize to the best Anatomist in the Junior Class; the Senn Prize, for the best Anatomical Preparation; and the Earl Prize, for the best Essay on Diseases of Children.

FEES.

Lecture Fees for the College Year, $75.00. Practitioners' Course, $30.00. Graduation Fee, $30.00. Registration Fee, $5.00. Demonstrator's Ticket, $5.00. Laboratory Ticket, $5.00. Hospital Ticket, $6.00.

For information concerning Text Books, Board, Seats in the College, requirements for Graduations, etc., consult the Annual Announcement, or address

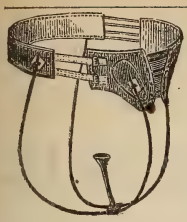
73 Randolph Street, Chicago, Ill.



DR. McINTOSH'S

Natural

UTERINE SUPPORTER.

No instrument has ever been placed before the medical profession which has given such universal satisfaction. The combination is such that the Physician is able to meet every indication of Uterine Displacements. Falling Womb, Anteversion, Retroversion and Flexions are overcome by this instrument, where others fail; this is proven by the fact that since its introduction to the Profession it has come into more general use than all other instruments combined.

Among the many reasons which recommend this Supporter to the Physician is its self-adjusting qualities. The Physician after applying it need have no fear that he will be called in haste to remove or readjust it, as is often the case with rings and various pessaries held in position by pressure against the vaginal wall, as the patient can remove it at will and replace it without assistance.

The Abdominal Supporter is a broad morocco leather belt, with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen. The Uterine Support is a cup and stem made of highly polished hard rubber, very light and durable, shaped to fit the neck of the womb, with openings for the secretions to pass out; as shown by the cuts. Cups are made with extended lips, to correct flexions and versions of the womb.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, passing down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic adapt themselves to all the varying positions of the body, and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Anteversion, Retroversions, or any Flexions of the Womb, and is used by the leading Physicians with never failing success, even in the most difficult cases.

Price—to Physicians, $8.00; to Patients, $12.00

Instruments sent by mail, at our risk, on receipt of price with 16 cents added for postage, or by Express, C. O. D.

DR. McINTOSH'S NATURAL UTERINE SUPPORTER CO.,
192 JACKSON STREET, CHICAGO, ILL.

Our valuable pamphlet "Some Practical Facts about Displacements of the Womb," will be sent you free on application.

WM. H. DE WITT, M.D., Lecturer on Mental Diseases.
B. P. GOODE, M.D., Lecturer on Diseases of Children.
ROBT. SATTLER, M.D., Lecturer on Diseases of the Eye and Ear.
A. D. BENDER, M.D., Lecturer on Laryngoscopy and Diseases of the Throat, and Demonstrator of Anatomy.
C. A. LE BOUTILLIER, M.D., Lecturer on Surgical Dressings.
CHAS. W. MATHERS, M.D., Demonstrator of Anatomy.
WM. L. DUDLEY, Demonstrator of Chemistry.

The Preliminary Term of Lectures will begin September 3d, 1879, and continue one month. This Course will be one of *unusual interest and importance* to physicians as well as students.

The Regular Winter Session will begin October 1st, 1879, and continue five months. This course will consist of Didactic Lectures with Demonstrations, Recitations, Clinical and Special Instruction, involving Physical Manipulations. From five to six Didactic Lectures and Demonstrations are delivered daily, covering the general topics of Medicine and Surgery as taught in all regular medical colleges.

CLINICS.—The Faculty confidently announce that students have, in this college, unsurpassed clinical advantages. *Four Special Clinics* are held daily, in the college building (at which more than six thousand patients are examined annually), viz.: In Practice, Surgery, Gynæcology, Diseases of Children, Ophthalmology and Larnygology, in all of which advanced students have opportunities to make full examinations, especially in *Thoracic Diseases* and *Gynæcology*, and frequently to witness *Obstetric* cases. These clinics are free to students of the college. Two clinical lectures are delivered daily at the Cincinnati Hospital (near the college), during the entire college session.

The College also affords the fullest advantages in *Practical Chemistry*, *Practical Anatomy*, *Practical Physiology* and *Microscopy*.

FEES.

Matriculation fee (annually)	$ 5 00	Demonstrator's Ticket	$5 00
Regular Lecture Term	75 00	Hospital Ticket	5 00
Graduation Fee	25 00	Alumni of this institution free.

Lecturer on Anatomy and Genito-Urinary Diseases.

E. L. SHURLY, M.D.,
Lecturer on Materia Medica, Therapeutics and Clinical Laryngology.

HAL. C. WYMAN, M.D.,
Lecturer on Physiology.

J. G. JOHNSON, M.D.,
Lecturer on Diseases of Mind and Nervous System.

J. H. CARSTENS, M.D.,
Lecturer on Clinical Medicine.

F. A. SPALDING, M.D.,
Lecturer on Diseases of the Skin.

C. C. YEMANS, M.D.,
Lecturer on Chemistry.

E. A. CHAPOTON, M.D.,
Demonstrator of Practical Physiology and Instructor in Anatomy and Surgery.

J. W. ROBERTSON, M.D.,
Demonstrator of Practical Microscopy.

DAVID INGLIS, M.D.,
Instructor in Chemistry and Physiology.

E. B. WARD, M.D.,
Curator of Museum and Librarian.

The Collegiate Year is divided into three sessions.

Preliminary Session opens Wednesday, September 3d, 1879, and closes September 30th. The Clinics are held and the Lectures delivered by the Professors of the regular Faculty, and in the same order and frequency as during the Winter Term. Opportunity is given to dissect or work in the Chemical and Physiological Laboratories.

The Regular Session opens Wednesday, October 1st, 1879, and closes March 2d, 1880. During this term all the branches of *General Medicine* and *Surgery*, both scientific and practical, are taught with care and thoroughness. All students are daily examined on the subjects of the lectures and on their dissecting and laboratory work.

Senior students have *daily practice* in the *art of examining patients*, in forming their own diagnosis, prognosis and treatment. As this is done under the direction of the professor holding each clinic, and in the presence of the class, it constitutes an invaluable course of training.

The Recitation Session begins March 10th, 1880, and closes June 23d, 1880. Daily during this term will be held recitations for both Seniors and Juniors, and one or two clinics and a lecture.

The recitations will embrace a thorough drill upon the general subjects of the Regular Session, viz.: Anatomy, Chemistry, Physiology, Practice of Medicine, Materia Medica and Therapeutics, Surgery, Obstetrics, Diseases of Women and Children.

Though the Recitation and Preliminary Sessions are optional, it is hoped that all who can will avail themselves of their manifest advantages in commencing the study of medicine, or in supplementing the regular winter course.

Three Hospitals—Harper's, St. Mary's and St. Luke's—with two large free dispensaries, afford an abundance of clinical material for illustrative and practical teaching.

All lectures are delivered on Hospital grounds. The *peculiar feature* of this school is the *intimate union* between its *laboratory*, *clinical* and *didactic* instruction.

Fees.—For Preliminary and Regular Sessions: Matriculation, $5. Hospital Fees, $10. Lecture Fees, $40. Graduation, $25. Lecture Fees to third course students, $25.

For the Recitation Term the Lecture Fees are $10, to those who attend the other courses. All others are required to matriculate and take out the Hospital tickets.

All fees payable in advance to the *Secretary*.

Announcement and Catalogue, or any further information which may be desired, can be promptly obtained by addressing

LEARTUS CONNOR, M.D., Secretary,
92 Cass Street, Detroit.

SPECIAL FACTS CONCERNING

BELLADONNA PLASTER

IN RUBBER COMBINATION.

PREPARED BY

SEABURY & JOHNSON.

In undertaking the manufacture of Medicinal Plasters we had but one object in view—THE IMPROVEMENT OF ALL KINDS OF PLASTERS. Among the various plasters manufactured by us was BELLADONNA PLASTER. This article met with a larger demand than some of the others, acquired a reputation among the best druggists, and received the confidence of the profession. Its large sale interfered with rival manufacturers, and continuous efforts have been made on their part to prejudice physicians against it.

As these attacks have been of late more malicious than usual, we have deemed it advisable, in self-defence, and in order to place our article fairly before the practitioner, to assign reasons why we consider it the most thoroughly reliable preparation ever offered the medical profession. First, it is a combination of the Alcoholic Extract of Belladonna only, with purified rubber, and thus possesses all of the advantages of the rubber base, being pliable, convenient of application, and not subject to the deteriorating influence of age, as is the case when any other base is used. Secondly, it is freed from all irritative properties. Thirdly, it is more adhesive than any other plasters. Fourthly, we believe it to be as perfect, in every respect, as it is possible to make a Belladonna plaster.

ENGLISH EXTRACTS—WHY WE DO NOT EMPLOY THEM.

Imported English Extracts are prepared from the Inspissated Juice of the leaf, while our pharmacopœia formula is treated by Alcohol. The active principle of Belladonna (Atropia) is only partially obtained by Inspissation. The employment of Alcoholic or Hydro-Alcoholic Solvents completely exhausts the entire strength of the drug.

The value of both preparations is clearly presented in an able treatise published in the *American Journal of Pharmacy*, April 1876, page 145. Our own investigations are substantially identical:—

TABLE OF RESULTS,

	Test solution requisite for 100 cc. of Ext. Solution.	Percentage of Atropia in Extract.
EXT. BELLADONNÆ ALCOH. U. S. P.	*17·732*	*2·571*
GEO. ALLEN & CO., English	*9·73*	*1·411*
*HERRINGS & CO., " *	*8·133*	*1·179*
E. MERCK, Germany (aqueous extract), made 1869	*1·9*	*·275*

This analysis clearly establishes the fact that the **Alcoholic Extract of Belladonna of the U. S. P. averages over twice the strength of English Extracts,** and should, therefore, be preferred in all cases where a reliable article is desired. Inspissated and Aqueous Extracts deteriorate, while Alcoholic remain stable.

Therefore the assumption of pretentious manufacturers, that the English Extracts are the superior preparations, must be based on a former supposition rather than present facts. The following analysis substantiates our claim regarding English Extracts.

ANALYSIS OF BELLADONNA PLASTERS, BY PROF. R. OGDEN DOREMUS.

"BELLEVUE HOSPITAL COLLEGE, New York, Sept. 7, 1878.

"GENTLEMEN—I obtained from Messrs. W. H. Schieffelin & Co., of this city, samples of Belladonna Plasters prepared by Grosvenor & Richards, Boston; Mitchell Novelty Plaster Works; Seabury & Johnson, New York and London. I have examined these varieties for the purpose of determining which possesses the largest quantity of Atropine. I employed equal surfaces of each, and *my analysis demonstrated that* SEABURY & JOHNSON'S *contains the greatest proportion* of the active principle of Belladonna. "R. OGDEN DOREMUS, M.D., L.L.D."

Belladonna Plaster, prepared by Seabury & Johnson, is packed in elegant tin cases, which contain 1 yard each, and can be obtained of almost any druggist throughout the United States and Canada, or will be furnished direct by mail. Samples sent on application.

BETHESDA WATER.

BELLEVUE, PA., May 21st, 1879.

W. B. HYATT, M.D.,
Marshallville, Wayne Co., Ohio.

DEAR SIR:—Your letter received this morning. Am sorry my friend Dr. S. did not think to tell you to address me at Pittsburg, and your communication would have reached me in a few hours instead of days, as I seldom call at the village P. O.

You will address your orders for BETHESDA WATER to JOSEPH FLEMING, 84 Market Street, Pittsburg, Pa., and they will receive prompt attention. I say this on account of my business acquaintance with Mr. Fleming. I will call on him in the morning, and have him send you pamphlets and any information relative to the matter he may think required.

If my testimony regarding the efficacy of Bethesda Water was required, I could cite several cases of my own personal knowledge. I am convinced that it is a specific in diseases arising from a morbid condition of the kidneys, providing, of course, that the disease has not reached a point beyond the possibility of recovery, as in the case of my late brother, and even then no figures could estimate its value in giving relief from suffering. I have a friend who was under treatment of different physicians all last fall and winter, and apparently getting worse: I persuaded him to stop the treatment and use the "water," and before he had used ten (10) gallons he was much better, and now nearly if not quite well. The doctors would diagnose Phlebitis, but there was a low specific gravity of the urine and other indications of kidney or dropsical affection, which satisfied me that he needed the effects of the "water;" and the results are as stated, and the inflamed vein is getting well, as well as general improved health. It occurs to me, the duty of physicians to investigate such things, and if they contain medicinal virtues, to make it known to suffering humanity instead of standing aloof until men in other walks of life have long recognized and demanded its use. Of course, there are so many new remedies claimed that are worthless, that there is some excuse, yet this Bethesda Water has been in use more than ten (10) years, and comparatively few physicians appear to know anything about its properties. Although you are a stranger to me, allow me to commend you, or any worthy physician who is willing to investigate and test its claimed virtues, and if found, to disseminate the knowledge among their less fortunate fellows. Yours, truly,

W. J. THOMPSON.

P. S.—If you have occasion to address me further, send your letter to Auditor's Office, P. A. R. R., Pittsburg, Pa.

DR. L. D. McINTOSH'S
Electric or Galvanic Belt.

If this new combination could be seen and tested by the medical profession, few, if any, words would be needed from us in its favor, for it combines utility with simplicity in such perfection that seeing it is convincing proof of its great value. The medical profession to-day acknowledge, almost universally, Electro-Therapeutics.

This combination is composed of sixteen cells, placed in pockets on a belt. Each cell is made of hard vulcanized rubber, lined with a copper cell, which constitutes the negative plate. The rubber coating perfectly insulates each cell. The positive plates are of zinc, wrapped in a porous material, to absorb the exciting fluid and prevent contact with the copper, and permit the current to pass from the copper to the zinc.

Thus the cells are charged without wetting the belt, and the discomfort following to the patient. A wire is soldered to each zinc plate, which connects with the copper cell by entering a tube on its side, thus rendering the belt pliable.

The McIntosh Electric Belt is superior to all others for the following reasons:—

It is composed of sixteen cells—thus giving a powerful current. A current selector is so arranged that one or more cells can be used at pleasure. There is not anything irritating about the Belt, as is the case with all other contrivances where the metal used is wet with weak acids and placed next to the skin. The electrodes are pieces of metal covered similar to ordinary battery electrodes, and connected with the cells by connecting cords. By this arrangement, a current from the Belt can be applied, to produce a general or local effect.

Physicians who have used this belt in their practice do not hesitate to recommend it to the profession.

Our pamphlet on Medical Electricity sent free on application. Address

HORSFORD'S

Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges.

Dextro-Quinine in Intermittent Fever.

Case.	Name and Sex of Patient.	Age, etc.	Number of Paroxysms before taking.	Number of Paroxysms after.	Dose and Mode of Exhibition.	Total amount Exhibited.	Remarks, Pathological and Physiological Phenomena, etc.	Reported by
1	J. S. S.	27	14	0	10 grs. at bedtime.	30 grs.	I have found Dextro-Quinine fully equal to the Sulphate of Quinia, with almost none of the disagreeable symptoms of the latter.	F. C. Hageman, M.D., Seaford, L.I.
2	D. V. W.	14	5	0	8 grs. at bedtime.	24 grs.		
3	Emma L.	16	60 or more.	0	5 grs. every three hours, in glycerine, without intermission, only during febrile exacerbations, etc.	30 grs.	Patient was very much prostrated with typho-malarial fever; been under the care of another physician; was called in on the third week. I then prescribed 5 grs. of Dextro-Quinine every three hours, in glycerine, when, as it were by magic, all the grave symptoms abated at once, and the patient made a rapid recovery.	Alex. F. Joseph, M.D., Napoleon, Ind.
21	Mrs. S., *Double Quotidian.* Had taken large doses Cinchonidia sulphate without effect.	22 Brunette. Married. No children.	6	0	20 grs. divided into chart. No. v, one every two hours.	20 grs.	Had first paroxysm Nov. 20, 6 A.M., again at 4 P.M. Presented Cinchonidia sulphate, grs. xxx, chart. No. v. One to be taken every two hours. Nov. 21. Return of paroxysm at 6 A.M. and 4 P.M. Gave Cinchonidia sulphate, grs. xlv, chart. No. v. One to be taken every two hours. Nov. 22. Return of paroxysm at same time as on preceding days. Prescribed Dextro-Quinine, grs. xx, chart. No. v. One to be taken every two hours. No return of chill since that date, and highly pleased with my experience.	N. H. Manring, M.D., Rigdon, Ind.
15	I. de L., female. *Tertian.* Habituated to Quinia.	19 Married.	2	0	15 grs. in 3 doses of 5 grs., taken at intervals of ½ hour, commencing four hours before expected paroxysm. Taken in capsule.	15 grs.	Dilatation of pupil; tinnitus aurium severe, but not so much so as on former occasions when Sulphate of Quinia was used. Directed her to take 10 grains on the third day, but she did not do so. Twelve days have elapsed without return of chills. Is taking citrate of iron and strychnia.	
16	Jennie S., colored. *Quotidian.* Has "used Quinine and everything else," as she herself expressed it.	25 Married.	Unknown, but a very large number.	1	16 grs. in 4 doses, in capsule, with 1-16 gr. Morph. acet., to be taken at ½ hour intervals, commencing four hours before expected paroxysm.	48 grs.	On first evening after exhibition of Dextro-Quinine had a very slight ague, followed by considerable fever, which, however, soon passed off. Gave Hydrarg. Chlor. Mite, grs. x, at bedtime, which caused three or four operations of the bowels. The Dextro-Quinine was continued the next day. *Missed chill for first time in over a month.* Thought it best to continue medicine (without Morphia) another day. Has had no return up to to-day (10 days). Did not complain of tinnitus.	Frank S. James, Ph.D., M.D., Osceola, Ark.
5	Mary B.	3½	3	0	1 gr., in solution, every three hours.	16 grs.	Commenced the Dextro-Quinine just after last paroxysm; it acted excellently. It is now more than four weeks since she took the remedy; there has been no return. She is now in the enjoyment of good health.	G. H. Berry, M.D., New York City.
6	Edward Libby. *Tertian.*	24	9 or 10	0	Two 12-grain doses at half-hour intervals.	24 grs.	Had been taking Sulphate of Quinia in 5-gr. doses for some time, with little or no effect. Has had no chill since the Dextro-Quinine was administered (more than a month having elapsed), and the result is entirely satisfactory.	H. A. Weymouth, M.D., Saco, Me.
11	Mary Cavanough. *Quotidian.*	3	One a day for six months.	0	2 grs. in powder, every two to three hours.	15 grs.	Little girl had been complaining with chills and fever for over six months; had used Sulphate of Quinia, Tincture Cinchona, Cincho-Quinine, etc. *Had taken great quantities of Sulphate of Quinia, without effecting a cure. I gave in all about 15 grs. of Dextro-Quinine, and she never has had any chill since.* This one case in particular I think a remarkable one. The little girl had had chills regularly, almost every day, for over six months, had been treated by two physicians, and a cure could not be effected, as they and the family thought, under any circumstances. I was called directly after, and gave 2 grs. *Dextro-Quinine,* in powder, every two to three hours, and to my great surprise, as well as every one else's, she failed to have any more chills. I then put her on a tonic of iron, and she is now enjoying good health. I consider the Dextro-Quinine far superior to any of the preparations of Quinine, and, from what I have seen of its medicinal effects, I do not hesitate to recommend it as superior to all other remedies in Remittent and Intermittent Fevers.	J. H. Struble, M.D., Stanhope, N. J.

DEXTRO-QUININE sent by mail, at the rate of $1.60 per ounce, to Physicians who cannot be supplied by their local Druggists. Address

KEASBEY & MATTISON, Philadelphia.

BE CAREFUL TO SPECIFY McKESSON & ROBBINS'.

IMPORTANT TO PHYSICIANS!

The fact that Sulphate of Quinine is only soluble in over 700 parts of water is not generally known, or if known is not usually considered, except in prescriptions, when this difficulty is overcome by the addition of Acid; and the further fact that **Bi-Sulphate of Quinine** is soluble in **only 10 parts of water** is as little appreciated.

McKesson & Robbins have paid much attention to the subject of putting Quinine into Pills, in a condition approaching that of a solution, and have at last succeeded in their **BI-SULPHATE OF QUININE PILLS,** and offer the same to the profession, confident that they will stand any test for solubility and prompt action. Physicians will please always specify **McK. & R. Bi-Sulph. Quinine Pills,** and they will not be disappointed in results.

Note.--With no reference to *respectable* druggists, we would say that cases have come to our knowledge and have been noted, where other pills have been substituted on prescriptions for ours.

POWDERED PURIFIED CHINOIDINE.

Containing all the Non-Crystalizable Alkaloids of Cinchona Bark.

Similar preparations have been lately offered in market AT HIGH PRICES under different fancy appellations, and claims made for the same as of equal efficiency with Quinine.

As a great demand exists for a cheap anti-malarial remedy, we introduce this preparation at low figures; and, in order that the profession may judge practically of its merits, will forward a sample to any physician's address, or mail one ounce upon receipt of FIFTY CENTS.

Yours respectfully,

McKESSON & ROBBINS,

Wholesale Druggists and Manufacturing Chemists,

91 FULTON ST., NEW YORK.

SPECIFY McKESSON & ROBBINS' Oval Shape. Complete Coating.

GRANULATED EFFERVESCENT SALTS

PREPARED BY

WILLIAM R. WARNER & Co.,

CHEMISTS,

PHILADELPHIA.

Granulated Effervescent

VICHY SALT.

(Grand Grille.)

A large teaspoonful dissolved in half a glass of water, forms a grateful and refreshing draught, identical with the natural water. Per dozen, $4.00

Granulated Effervescent

SELTZER SALT.

A tablespoonful to half a glass of water forms a grateful and refreshing saline draught, identical with the natural water. Per Dozen, $4.00

Granulated Effervescent

SEIDLITZ MIXTURE.

(Seidlitz Powder, U. S. P.)

An excellent aperient and refrigerant, very acceptable to the stomach. Per doz. $4.00

Dose.—One tablespoonful in a glass of water.

Granulated Effervescent

NITRATE of POTASSIUM.

A dessert-spoonful in glass of water makes an excellent mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

CITRATE OF POTASSIUM.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $5.00

Granulated Effervescent

Bi-Carbonate of Potassium.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

Pepsin, Bismuth and Strychnia.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin, soluble Citrate of Bismuth, and the sixtieth grain of Citrate of Strychnia. Per dozen, $10.00

Granulated Effervescent

PEPSIN AND BISMUTH.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin and soluble Citrate of Bismuth. Per doz. $9.00

Granulated Effervescent

CITRATE OF MAGNESIA.

(Pleasant and Efficient.)

For a purgative effect, take two or more tablespoonfuls added to a small glass of water, and drink while effervescing. As a laxative, one or more tablespoonfuls taken in the same manner. One or two teaspoonfuls in sweetened water, produces a delightful, cooling drink in summer. Per dozen, $4.00

Granulated Effervescent

CITRATE LITHIA.

Each drachm or teaspoonful contains four grains of the chemically pure salt. Valuable in Rheumatic, Gouty and Analogous disorders. Per dozen, $10.00

Granulated Effervescent

KISSINGEN SALT.

A large teaspoonful dissolved in half a glass of water, forms an agreeable and refreshing draught identical with the natural water. Per dozen, $4.00

Granulated Effervescent

CRAB ORCHARD SALT.

Prepared from the exact analysis of the purified natural salt, obtained from the Crab Orchard Spring, Ky.

A tablespoonful in half a glass of water forms a grateful effervescing draught, producing the effect of the natural water. Per dozen, $4.00

Granulated Effervescent

OXALATE OF CERIUM.

Each drachm or large teaspoonful contains two grains of Oxalate of Cerium. Per dozen, $5.00

Granulated Effervescent

CITRATE CAFFEINE.

A dessert-spoonful containing one grain of Citrate of Caffeine should be given for sick headache, every hour or two before and during the paroxysms. Per dozen, $10.00

Physicians will please specify Warner & Co.—Equal to best English.

FOOD IS THE BEST TONIC!!

MENSMAN'S

PEPTONIZED

BEEF TONIC.

The great necessity for a fluid food that would possess *all the elements necessary for the support of the system,* having been long felt by the medical profession, we call attention to this preparation, containing the entire nutritious properties of the muscular fibre, blood, bone, and brain of a healthy bullock, dissolved and semi-digested by aid of heat and pepsin, and preserved by spirit; thus constituting a most perfect nutritive, reconstructive tonic.

It is not a mere stimulant, like the now fashionable extracts of beef, but contains blood-making, force-generating, and life-sustaining properties, pre-eminently calculated to support the system under the exhausting and wasting process of fevers and other acute diseases, and to rebuild and recruit the tissues and forces, whether lost in the destructive march of such affections, or induced by overwork, general debility, or the more tedious forms of chronic disease.

It is friendly and helpful to the most delicate stomach, and where there is a fair remnant to build on, will reconstruct the most shattered and enfeebled constitution. It is entirely free from any drugs.

It is prepared after a thoroughly tested and scientific method.

PROPRIETORS,

CASWELL, HAZARD & CO.,

Druggists and Chemists,

FIFTH AVE., COR. 24th ST., and SIXTH AVE., COR. 39th ST., NEW YORK.

APOLLINARIS WATER.

HIGHLY EFFERVESCENT.

Approved by the Academy of Medicine of France, and its Sale in France as a Natural Mineral Water authorized by Special Decree of the French Government.

"The Exquisite Apollinaris."—Dr. J. Milner Fothergill. "Queen of Table Waters."—Lon. Med. Record.

APOLLINARIS WATER has been the subject of the most favorable reports from Professors Fordyce Barker, Ogden Doremus, Austin Flint, W. A. Hammond, Loomis, F. N. Otis, E. R. Peaslee, Sayre, Marion Sims, James R. Wood, New York, etc., etc.

APOLLINARIS	Used habitually as a table water, its pleasant taste and richness in pure carbonic acid favorably distinguish it from the other similar mineral waters.—Prof. Dr. VIRCHOW, *Member of the German Parliament, and Professor University of Berlin.*
APOLLINARIS	EXCEPTIONALLY VALUABLE and PLEASANT as a table-water in HYGIENIC as well as DIETETIC respects; maintains its FRESHNESS on the PALATE when constantly used.—Prof. Dr. OSCAR LIEBREICH, Berlin.
APOLLINARIS	I have for many years always obtained the best success with this water in cases of severe DISORDERS of the DIGESTION; in PHTHISIS, during CONVALESCENCE from severe Illnesses, after TYPHUS PNEUMONIA, ARTICULAR RHEUMATISM, and also in DIPHTHERIA, and in the various other diseases in which it was necessary to produce a TONIC EFFECT upon the STOMACH and the DIGESTION. I have of late almost EXCLUSIVELY EMPLOYED IT.—Prof. Dr. OERTEL, Munich, *Author of Treatise on Diphtheria, &c., Ziemssen's Cyclopædia.*
APOLLINARIS	REFRESHING, PROMOTES DIGESTION, and is especially to be recommended as an adjuvant in the following morbid conditions: DYSPEPSIA characterized by ACIDITY of the STOMACH, GASTRO-ENTERALGIA, tendency to GALL-STONES, GOUTY conditions, CATARRHAL affections of the GENITO-URINARY MUCOUS MEMBRANE, and UTERINE CONGESTION leading to CATAMENIAL HEMORRHAGE. The habit of drinking Apollinaris Water has SAVED many from TYPHOID Fever, while their COMPANIONS drinking COMMON WATER were INFECTED.—Dr. HERMANN WEBER, *Fellow of the Royal College of Physicians, London, &c., &c.*

Further Testimonials from numerous authorities, including Professors Frankland, F.R.S., Lond.; Odling, F.R.S., Oxford; A. W. Hoffmann, F.R.S., Privy Councillor, Berlin; Kekulé, Rector of University of Bonn; Professors Ditterich, Munich; Nussbaum, Munich; Varrentrapp, Frankfort; T. K. Chambers, Physician to the Prince of Wales; Peter Hood, M.D.; Peter Squire, F.L.S., Chemist to the Queen, and others; Professors Drs. Labbé, Fauvel, A. Latour, L. Championnière, Constantin James, Lutaud, &c., France, and many others, have been published and may be obtained on application to

F. DE BARY & CO., 41 & 43 Warren St., New York.

Apollinaris Water may be had of all Wine Merchants, Grocers, Druggists, and Mineral Water dealers throughout the United States.

DUREL'S
TAR AND IRON SYRUP AND CAPSULES.

PREPARED BY DUREL, PHARMACIST, PARIS.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron is a desideratum which has at last been attained in these preparations. The indications for such a remedy are many, but it has been found especially useful in CHLOROSIS, BRONCHIAL CATARRH, CATARRH OF THE BLADDER, CHRONIC UTERINE DISCHARGES, depending upon an enfeebled or relaxed state of the system.

Sold by Chemists generally.

CRINON'S HÆMOGLOBIN,

The Albuminoid Ferruginous Principle of Blood.

HÆMOGLOBIN is the only physiological chalybeate. Associated as it is with the phosphates of the blood, it forms the most powerful of tonics, and at the same time a most nourishing food. It is especially useful in cases of *Anæmia*, *Chlorosis*, *Cachexias*, *Exhaustion* caused by excess of work, nervous debility, fatigue resulting from parturition and lactation. It replaces entirely liquid blood, which has been recommended and used with success in *Phthisis* and *wasting away*.

It is offered in two forms: In cachets (wafers), 60 of which are contained in a box; combined with chocolate in small squares, 30 of which are in a box; both forms can be sent by mail.

Prepared by C. CRINON, Paris, Pharmacist of the first class, Laureate of the Hospitals of Paris. Samples may be obtained by application to

E. FOUGERA & CO., New York, Agents for the U. S.

FOUGERA'S COMPOUND IODINISED
COD LIVER OIL.

Since the introduction of this oil in 1858, it has been found to be superior to all other kinds of Cod Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod Liver Oil, but also the **tonic, stimulant** and **alterative** properties of **Iodine, Bromine** and **Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod Liver Oil.

Through its **increased curative action, FOUGERA'S COD LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod Liver Oil would fail entirely.

FOUGERA'S READY-MADE MUSTARD PLASTERS.

A most useful, convenient, clean, and economical preparation. Not liable to change if kept in a dry place. Made of two strengths. Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll, of 10 plasters each. DIRECTIONS.—Dip the Plaster, or Plasters, a minute or two, in cold water; apply on the part, and cover with a band.

FOUGERA'S COMPOUND ICELAND MOSS PASTE.

(Iceland Moss, Lactucarium, Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, etc.

Wakefulness, Cough, and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this Paste.

FOUGERA'S IODO-FERRO-PHOSPHATED ELIXIR OF HORSE-RADISH.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of antiscorbutic and aromatic plants, and acts as a **tonic, stimulant, emmenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

PNEUMATIC ASPIRATION,

AFTER THE MANNER OF DIEULAFOY.

"It is always possible, owing to Aspiration, to search for a fluid collection without any danger, whatever may be its seat or its nature."

"I have thrust these needles into almost every part of the body; into the Joints, the Liver, the Spleen, the Bladder, the Intestines, the Lungs and the Meninges; and I can affirm, and a great number of observers affirm with me, that we have never seen consecutive accidents."—*Dieulafoy on Pneumatic Aspiration*, pp. 21, 24.

We invite the attention of the Medical Profession to this New Apparatus for Aspiration, constructed upon the general plan of Potain's modification of Dieulafoy's Aspirator, but containing the following improvements and inventions of our own:—

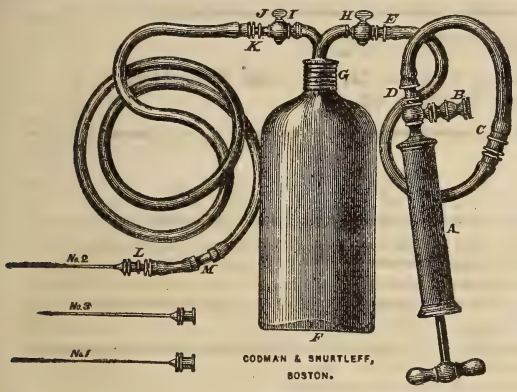

Fig. 68.

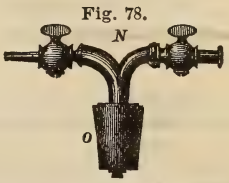
Fig. 77.

Fig. 78.



The Stopper and Cocks supplied with Apparatus No. 2.

1st. Means of changing the pump from an exhaust to a force-pump, and *vice versa*, thereby enabling the operator not only to draw an abnormal fluid, but to inject the cavity through the tubes and needle of the apparatus with one adapted to induce healthy action.—*See Dieulafoy on Aspiration*, pp. 276, 278.

2d. The employment, in our apparatus No. 1, of a metal Screw Cap, fitting the neck of the receiver supplied with this apparatus so securely that it cannot be forced from its place by condensed air while injecting, or accidentally removed while the receiver is in a state of vacuum for aspiration

3d. The substitution, for the ordinary oiled silk valves of other apparatus, of a kind indestructible, both in form and material.

4th. A simple and comparatively inexpensive attachment for evacuating the contents of the stomach, equal, if not superior, to any in use hitherto.

Commendations bestowed upon our Aspirators, by physicians familiar with the latest European and American ones, lead us to believe that, in some important particulars, at least, they are superior to any.

In his work on Pneumatic Aspiration, Dieulafoy shows the harmlessness of the Aspiratory puncture, and its great superiority to the Exploring Trocar as a means of accurate diagnosis in all collections of Pathological Fluids. It has been used with unprecedented success in the Retention of Urine, Reduction of Strangulated Hernia, in Ascites, Hydrothorax, Empyema, Pneumothorax, Effusions into the Pericardium, Serous, Purulent and Hematic Effusions of the Knee, Hydrocele, Hydatid Cysts, Abscesses of the Liver, and in various other Pathological Lesions.

PRICES OF APPARATUS.

No. 1. Air Pump—exhaust or condensing as described; 16 oz. receiver, of strong glass, with screw-cap; three steel, gold plated Aspiratory Needles, together with the necessary tubes, stop-cocks, etc., as shown in Fig. 77, fitted in a neat case, accompanied with printed directions $16.00. Postage 64 cents.

No. 2. The same, without receiver, and with rubber stopper (see Fig. 78) to fit almost any bottle of quart capacity, or less, instead of screw-cap arrangement, also with printed directions $14.00. Postage 32 cents.

No. 3. Dieulafoy's Notched Aspirator, Nickel-plated, with two Needles, Tubes, etc., in case $14 00

No. 4. Stomach Attachment, as described, adapted to pump accompanying Nos. 1 and 2, additional $6.00. Postage 22 cents.

The foregoing are the product of our own factory, and are warranted in every respect.

Also, **Dieulafoy on Pneumatic Aspiration,** post-paid, by mail, on receipt of..... 3 40

☞ *Full description on application.*

An illustrated Catalogue of Surgical Instruments, also a New Pamphlet on Atomization of Liquids, with description of Improved Apparatus and Formulæ of Remedies successfully employed, will be forwarded, post-paid, on application.

TO THE MEDICAL PROFESSION.

MALTINE.

(Extract of Malted Barley, Wheat & Oats.)

THIS PREPARATION

Contains from three to five times the Medicinal and Nutritive elements found in Extract of Malt.

MALTINE is a highly concentrated extract of malted *Barley*, *Wheat*, and *Oats*, containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST.—In the manufacture of **MALTINE** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates, and Albuminoids, on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity, possessing little virtue aside from the saccharine matter which it contains *

SECOND.—*Carbon*, *Hydrogen*, *Nitrogen*, *Sulphur*, *Iron*, *Magnesium*, and *Potassium*, are essential elements in the food of man, and it is only in **MALTINE**, containing the combined properties of malted *Barley*, *Wheat*, and *Oats*, that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD.—*Gluten* is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. **MALTINE** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH.—Liebig says, "Wheat and Oats stand first among our list of cereals in combining all the elements in proportions necessary to support animal life. They are especially rich in muscular and fat producing elements." The only reason we use Malted Barley, in the manufacture of **MALTINE**, is that it contains larger proportions of mineral matters (bone producers) and Diastase. It is deficient in all other essential elements.

We believe that any practitioner will readily recognize the superiority of MALTINE, and would request a trial and comparison of merits with any article offered for similar uses.

* As a sure test for Diastase, and the Albuminoids, a small quantity should be put in a test tube or small vial, largely diluted with water, and heated to the boiling point, when the Albumen, if present, will coagulate, and appear in little flocculent particles throughout the liquid. If the extract remains clear, it is proof that it has already been coagulated by excessive heat, and removed by filtration during the process of manufacturing. Any heat which will coagulate Albumen will inevitably destroy the digestive power of Diastase.

In corresponding with Advertisers please mention THE MEDICAL AND SURGICAL REPORTER.

The Nitrogenous constituents of *MALTINE* have a composition identical with that of the chief constituents of the Blood, and therefore contain nearly every element requisite for the reproduction of the human body.

MALTINE AND ITS COMPOUNDS

can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULÆ AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS, AND ON THE LABEL ATTACHED TO EACH BOTTLE:

MALTINE WITH HOPS.

MALTINE, FERRATED:

This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

MALTINE WITH PHOSPHATES IRON AND QUINIA:

A powerful general and nutritive tonic.

MALTINE WITH PHOSPHATES IRON, QUINIA AND STRYCHNIA:

A powerful nutritive, general and nervous tonic.

MALTINE WITH PEPSIN AND PANCREATINE:

One of the most effective combinations in Dyspepsia, Cholera Infantum, and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the *MALTINE*. We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

MALTINE WITH BEEF AND IRON:

One of the most valuable combinations in cases of General Debility, when there is deficient nutrition and a deficiency of Iron in the system.

MALTINE WITH ALTERATIVES:

In this preparation *MALTINE* is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.

MALTINE WINE.

This preparation contains all the medicinal and nutritive constituents of *MALTINE*, less 60 per cent. of the transformed starch or glucose, which renders the preparation lighter and more acceptable to some stomachs, and is recommended only in such cases.

MALTINE WINE WITH PEPSIN AND PANCREATINE:

(Each fluid ounce of MALTINE WINE contains 15 grains pure PEPSIN and 15 grains pure PANCREATINE).

We can recommend this preparation to the Medical Profession as being the most important remedy ever brought to their notice in all cases of Dyspepsia and Imperfect Nutrition, when the system needs invigorating and replenishing. It will be found, we believe, a perfect remedy in Vomiting in Pregnancy, Cholera Infantum and wasting diseases of children, and in Constipation and Chronic Diarrhœa resulting from mal-nutrition. It will agree with the most irritable stomach.

MALTO-YERBINE.

(Each pint of the above preparation contains 13 ounces MALTINE, 2 ounces CARRAGEEN and 1 ounce YERBINE).

With the nutritive, emollient and demulcent properties of *MALTINE* and *CARRAGEEN*, and the expectorant qualities of *YERBINE* (active principle of Yerba Santa), we offer this preparation to the Profession with the fullest confidence that it is the most perfect remedy yet produced in Chronic Pulmonary Affections, Irritation of the Mucous Membrane, Difficult Expectoration, Bronchitis and ordinary Coughs and Colds.

The Dose of all Preparations of *MALTINE* and compounds is from a dessert to a tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only.*

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in half-pint, pint and five-pint amber bottles; each bottle inclosed in a folding paper box.

REED & CARNRICK,

Manufacturing Pharmacists,

196 and 198 FULTON STREET, NEW YORK.

1137-1162-eow

TROMMER'S EXTRACT OF MALT.

The rapidly increasing demand for our IMPROVED EXTRACT OF MALT, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantities; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or moulding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expense of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops**, viz: MALT SUGAR, DEXTRINE, DIASTASE, RESIN and BITTER of HOPS, PHOSPHATES of LIME and MAGNESIA, and ALKALINE SALTS.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:—
Malt Sugar 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712. Alkalies .377; Water, 25.7; Total, 99.958.
In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article.

Yours truly,
SILAS H. DOUGLAS,
Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt contains a larger quantity of the active properties of Malt than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ pounds of the Extract.

Our preparations of Malt are for sale by druggists generally, throughout the United States and Canada, at the following prices:—

EXTRACT OF MALT,	*With*	*Hops (Plain)*,		$1.00
"	"	"	*Pyrophosphate of Iron (Ferrated)*,	1.00
"	"	"	*Cod Liver Oil*,	1.00

BARON LEIBIG, the greatest authority on Infant Diet, states that the majority of children who die under one year of age, do so from the effects of improper food, or from the improper administration of the food.

HORLICK'S FOOD.

A Concentrated Extract, prepared according to the Formula of Baron Liebig, and, unlike other Foods,

IS NOT FARINACEOUS.

It is acknowledged by Physicians to be the best Food

For Infants, Dyspeptics and Invalids.

Prof. J. Lewis Smith Says,

Speaking of **HORLICK'S FOOD:** "Being carefully prepared, according to Liebig's Formula, by Chemists fully competent, it possesses certain advantages, such as quick and easy preparation and a pleasant flavor, and is therefore highly esteemed by those who have used it." [*Page 58 of the fourth edition of a Treatise on Diseases of Infancy and Childhood. By J. Lewis Smith, M. D., etc.*—1879] Also, speaking in another place [page 647] of artificial food for infants, especially those suffering from intestinal catarrh, he says: "I prefer Liebig's, especially **HORLICK'S** preparation of it."

Report from Bellevue Hospital, New York.

In *The Hospital Gazette* for February 6th. 1879 [page 108] Dr. E. Hochheimer makes a report from BELLEVUE HOSPITAL of a case of Infantile Paralysis, which was followed by an exhausting diarrhœa—Speaking of the treatment, he says: "Her condition continued unchanged for the next three weeks; she was put upon a diet consisting principally of milk, but the diarrhœa persisted in spite of opiates and astringents."

"*Nov. 17th.—Milk was stopped, and she was put upon a diet of HORLICK'S FOOD; after this she began to mend, the diarrhœa became less and finally disappeared; she began to gain flesh, and her general condition was much improved.*"

We also beg to refer, by permission, to the following eminent medical men, who have used our Food extensively in their practice:—**Prof. DeLaskie Miller,** (Rush Medical College); **Prof. Wm. H. Byford,** (Chicago Medical College); **Prof. J. Adams Allen,** (Rush Medical College); **Drs. J. P. Oliver** and **C. P. Putnam,** (Harvard Medical School); **Prof. Gawne,** (Cleveland Medical College); and several hundred others whose testimonial letters are on file in our office.

PRICE, 75 Cents per bottle. Trial Size, 40 Cents.

BETHESDA WATER.

BELLEVUE, PA., May 21st, 1879.

W. B. HYATT, M.D.,

Marshallville, Wayne Co., Ohio.

DEAR SIR:—Your letter received this morning. Am sorry my friend Dr. S. did not think to tell you to address me at Pittsburg, and your communication would have reached me in a few hours instead of days, as I seldom call at the village P. O.

You will address your orders for BETHESDA WATER to JOSEPH FLEMING, 84 Market Street, Pittsburg, Pa., and they will receive prompt attention. I say this on account of my business acquaintance with Mr. Fleming. I will call on him in the morning, and have him send you pamphlets and any information relative to the matter he may think required.

If my testimony regarding the efficacy of Bethesda Water was required, I could cite several cases of my own personal knowledge. I am convinced that it is a specific in diseases arising from a morbid condition of the kidneys, providing, of course, that the disease has not reached a point beyond the possibility of recovery, as in the case of my late brother, and even then no figures could estimate its value in giving relief from suffering. I have a friend who was under treatment of different physicians all last fall and winter, and apparently getting worse: I persuaded him to stop the treatment and use the "water," and before he had used ten (10) gallons he was much better, and now nearly if not quite well. The doctors would diagnose Phlebitis, but there was a low specific gravity of the urine and other indications of kidney or dropsical affection, which satisfied me that he needed the effects of the "water;" and the results are as stated, and the inflamed vein is getting well, as well as general improved health. It occurs to me, the duty of physicians to investigate such things, and if they contain medicinal virtues, to make it known to suffering humanity instead of standing aloof until men in other walks of life have long recognized and demanded its use. Of course, there are so many new remedies claimed that are worthless, that there is some excuse, yet this Bethesda Water has been in use more than ten (10) years, and comparatively few physicians appear to know anything about its properties. Although you are a stranger to me, allow me to commend you, or any worthy physician who is willing to investigate and test its claimed virtues, and if found, to disseminate the knowledge among their less fortunate fellows. Yours, truly,

W. J. THOMPSON.

P. S.—If you have occasion to address me further, send your letter to Auditor's Office, P. A. R. R., Pittsburg, Pa.

Sunnyside Medical Retreat

For Mental and Nervous Diseases, Inebriety and the Opium Habit,

FORT WASHINGTON, NEW YORK CITY.

This home, situated on the banks of the Hudson, under the management of Dr. Edward C. Mann, late Medical Superintendent of the New York State Emigrant Insane Asylum, receives cases of either sex affected with mental disorders, Inebriety or the Opium habit. The beauty of location and surroundings, handsomely furnished apartments, and the attentions and comforts of home life, all combine to make Sunnyside an attractive and popular private retreat. Applications may be made to Dr. Mann, either by mail or personally, at Fort Washington. Twelve trains daily from Hudson River Depot, 30th St., and 10th Ave. Broadway and 23d St. line of stages run direct to depot. The profession respectfully invited to call, and cordially welcomed. 1152-1y

WOMAN'S HOSPITAL MEDICAL COLLEGE

337 and 339 S. Lincoln St., Chicago.

The *Tenth Annual Course of Lectures* will commence the first Tuesday in October, 1879, and continue twenty-one weeks. The Spring Term will commence April 1st, and continue twelve weeks. College building new. Clinical and Dissecting advantages unsurpassed.

FACULTY.—William H. Byford, A.M., M.D., President, Obstetrics; T. D. Fitch, M.D., Secretary, Gynecology; Charles W. Earle, M.D., Treasurer, Diseases of Children; I. N. Danforth, M.D., Pathology; J. E. Owens, M.D., Surgery; Henry M. Lyman, A.M., M.D., Practice of Medicine, D. R. Brower, M.D., Therapeutics and Nervous Diseases; Sarah H. Stevenson, M.D., Corresponding Secretary, Physiology; D. W. Natural

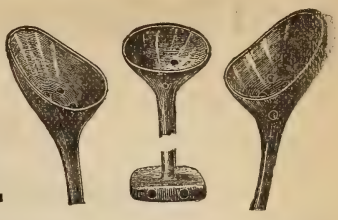
UTERINE SUPPORTER.



No instrument has ever been placed before the medical profession which has given such universal satisfaction. The combination is such that the Physician is able to meet every indication of Uterine Displacements. Falling Womb, Anteversion, Retroversion and Flexions are overcome by this instrument, where others fail; this is proven by the fact that since its introduction to the Profession it has come into more general use than all other instruments combined.

Among the many reasons which recommend this Supporter to the Physician is its self-adjusting qualities. The Physician after applying it need have no fear that he will be called in haste to remove or readjust it, as is often the case with rings and various pessaries held in position by pressure against the vaginal wall, as the patient can remove it at will and replace it without assistance.

The Abdominal Supporter is a broad morocco leather belt, with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen. The Uterine Support is a cup and stem made of highly polished hard rubber, very light and durable, shaped to fit the neck of the womb, with openings for the secretions to pass out; as shown by the cuts. Cups are made with extended lips, to correct flexions and versions of the womb.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, passing down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic adapt themselves to all the varying positions of the body, and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Anteversion, Retroversions, or any Flexions of the Womb, and is used by the leading Physicians with never failing success, even in the most difficult cases.

Price—to Physicians, $8.00; to Patients, $12.00

Instruments sent by mail, at our risk, on receipt of price with 16 cents added for postage, or by Express, C. O. D.

DR. McINTOSH'S NATURAL UTERINE SUPPORTER CO.,

MIAMI MEDICAL COLLEGE OF CINCINNATI.

Member of the American Medical College Association.

FACULTY.

JOHN A. MURPHY, M.D., Professor of Principles and Practice of Medicine and Clinical Medicine.
WM. H. MUSSEY, M.D., Professor of Operative and Clinical Surgery and Surgical Diseases of Women.
E. WILLIAMS, M.D., Professor of Ophthalmology, Aural Surgery and Clinical Ophthalmology.
WM. CLENDENIN, M.D., Professor of Descriptive and Surgical Anatomy.
WM. H. TAYLOR, M.D., Professor of Obstetrics and Clinical Midwifery.
THOMAS H. KEARNEY, M.D., Professor of Principles of Surgery, Surgical Diseases and Clinical Surgery.
J. C. MACKENZIE, M.D., Professor of Physiology and Pathology and Clinical Medicine.
J. F. JUDGE, M.D., Lecturer on Chemistry and Toxicology.
WM. B. DAVIS, M.D., Professor of Materia Medica and Therapeutics.
BYRON STANTON, M.D., Professor of Diseases of Women and Children and Clinical Gnyæcology.
WM. H. DE WITT, M.D., Lecturer on Mental Diseases.
B. P. GOODE, M.D., Lecturer on Diseases of Children.
ROBT. SATTLER, M.D., Lecturer on Diseases of the Eye and Ear.
A. D. BENDER, M.D., Lecturer on Laryngoscopy and Diseases of the Throat, and Demonstrator of Anatomy.
C. A. LE BOUTILLIER, M.D., Lecturer on Surgical Dressings.
CHAS. W. MATHERS, M.D., Demonstrator of Anatomy.
WM. L. DUDLEY, Demonstrator of Chemistry.

THE PRELIMINARY TERM of Lectures will begin September 3d, 1879, and continue one month. This Course will be one of *unusual interest and importance* to physicians as well as students.

THE REGULAR WINTER SESSION will begin October 1st, 1879, and continue five months. This course will consist of Didactic Lectures with Demonstrations, Recitations, Clinical and Special Instruction, involving Physical Manipulations. From five to six Didactic Lectures and Demonstrations are delivered daily, covering the general topics of Medicine and Surgery as taught in all regular medical colleges.

CLINICS.—The Faculty confidently announce that students have, in this college, unsurpassed clinical advantages. *Four Special Clinics* are held daily, in the college building (at which more than six thousand patients are examined annually), viz.: In Practice, Surgery, Gynæcology, Diseases of Children, Ophthalmology and Larnygology, in all of which advanced students have opportunities to make full examinations, especially in *Thoracic Diseases* and *Gynæcology*, and frequently to witness *Obstetric* cases. These clinics are free to students of the college. Two clinical lectures are delivered daily at the Cincinnati Hospital (near the college), during the entire college session.

The College also affords the fullest advantages in *Practical Chemistry*, *Practical Anatomy*, *Practical Physiology* and *Microscopy*.

FEES.

Matriculation fee (annually)	$ 5 00	Demonstrator's Ticket	$5 00
Regular Lecture Term	75 00	Hospital Ticket	5 00
Graduation Fee	25 00	Alumni of this institution free.	

JOHN A. MURPHY, M.D., Dean, 163 West Seventh Street.
WM. H. TAYLOR, M.D., Secretary, 329 West Seventh Street.

1160-1185

THE MEDICAL REGISTER AND DIRECTORY

OF THE

UNITED STATES,

SYSTEMATICALLY ARRANGED BY STATES:

COMPRISING

NAMES, POST-OFFICE ADDRESS, EDUCATIONAL AND PROFESSIONAL STATISTICS, OF MORE THAN 60,000 PHYSICIANS, WITH LISTS OF MEDICAL SOCIETIES, COLLEGES, HOSPITALS, AND OTHER MEDICAL INSTITUTIONS, WITH ABSTRACTS OF THE MEDICAL LAWS OF EACH STATE, NOTES OF MINERAL SPRINGS Etc.

BY

SAMUEL W. BUTLER, M. D.

SECOND EDITION, REVISED AND CORRECTED.

One Volume, large octavo, double columns, 874 pages. Price, Cloth, $5.50; Leather, $6.50.

The **SECOND EDITION** of this important work has been prepared at great cost of time and money. The lists have been carefully revised *by leading men in each State.* Nearly TEN THOUSAND new names have been added, and numerous corrections made. Those who have purchased the first edition will find this one to possess *all the value of a new work.*

This work has a *national* and *historic* value, as well as a present *business* one. Besides the names and addresses of all the physicians in the country, it contains the roster of the medical officers in the Army and Navy, list of the officers of State and County medical societies, a sketch of the medical geography of each State and Territory, analysis of the waters of all prominent mineral springs, and a mass of other information interesting to the profession. The collation of the *laws regulating the practice of medicine* in the various States is a feature of special interest and one not to be found in any other publication.

All who desire to reach medical men for business purposes, for instance, Life Insurance Companies, Medical Colleges, Wholesale Druggists, Importers and Manufacturers of Pharmaceutical Specialties, Dealers in Surgical Instruments, will find this book invaluable.

OPINIONS OF THE PRESS.

From the (London) *Lancet*.
This is the first work of the kind that has ever appeared on the other side of the Atlantic. The Editor and Compiler, Dr. S. W. Butler, and the publisher, are to be congratulated upon an undoubted success.

From the (London) *Medical Press and Circular:*
Upon opening its well-filled and well arranged pages our only surprise is that such a go-ahead race as our cousins have the credit of being, should have gone on so long without so valuable a book of reference.

From the (Philadelphia) *Medical Times:*
To publishers druggists and those members of the profession whose sympathies and needs are wide enough to reach beyond their own immediate neighborhood, this book must be invaluable.

From the (Cincinnati) *Lancet and Observer*.
Of very great value, and will be to physicians what the city directory is to the man of business, a book he cannot get along very well without.

From the *Medical and Surgical Reporter:*
A volume of very considerable importance, the appreciation of which must grow in time, and it should find a place in every medical library of any pretensions of completeness.

SESSIONS OF 1879-'80

FACULTY.

JAMES F. NOYES, M.D.,
Emeritus Professor of Ophthalmology and Otology.

THEO. A. McGRAW, M.D., President,
Professor of Principles and Practice of Surgery and Clinical Surgery.

GEORGE P. ANDREWS, M.D.,
Professor of Principles and Practice of Medicine and Clinical Medicine.

C. B. GILBERT, M.D.,
Professor of Obstetrics, and Diseases of Women and Children.

N. W. WEBBER, M.D.,
Professor of General and Descriptive Anatomy, and Clinical Surgery.

SAMUEL P. DUFFIELD, PH.D., M.D.,
Professor of Toxicology and Medical Jurisprudence.

ALBERT B. LYONS, M.D.,
Professor of Chemistry and Director of the Chemical Laboratory.

LEARTUS CONNOR, M.D., Secretary,
Professor of Physiology and Diseases of the Eye and Ear.

H. O. WALKER, M.D.,
Lecturer on Anatomy and Genito-Urinary Diseases.

E. L. SHURLY, M.D.,
Lecturer on Materia Medica, Therapeutics and Clinical Laryngology.

HAL. C. WYMAN, M.D.,
Lecturer on Physiology.

J. G. JOHNSON, M.D.,
Lecturer on Diseases of Mind and Nervous System.

J. H. CARSTENS, M.D.,
Lecturer on Clinical Medicine.

F. A. SPALDING, M.D.,
Lecturer on Diseases of the Skin.

C. C. YEMANS, M.D.,
Lecturer on Chemistry.

E. A. CHAPOTON, M.D.,
Demonstrator of Practical Physiology and Instructor in Anatomy and Surgery.

J. W. ROBERTSON, M.D.,
Demonstrator of Practical Mieroscopy.

DAVID INGLIS, M.D.,
Instructor in Chemistry and Physiology.

E. B. WARD, M.D.,
Curator of Museum and Librarian.

The Collegiate Year is divided into three sessions.

Preliminary Session opens Wednesday, September 3d, 1879, and closes September 30th. The Clinics are held and the Lectures delivered by the Professors of the regular Faculty, and in the same order and frequency as during the Winter Term. Opportunity is given to dissect or work in the Chemical and Physiological Laboratories.

The Regular Session opens Wednesday, October 1st, 1879, and closes March 2d, 1880. During this term all the branches of *General Medicine* and *Surgery*, both scientific and practical, are taught with care and thoroughness. All students are daily examined on the subjects of the lectures and on their dissecting and laboratory work.

Senior students have *daily practice* in the *art of examining patients*, in forming their own diagnosis, prognosis and treatment. As this is done under the direction of the professor holding each clinic, and in the presence of the class, it constitutes an invaluable course of training.

The Recitation Session begins March 10th, 1880, and closes June 23d, 1880. Daily during this term will be held recitations for both Seniors and Juniors, and one or two clinics and a lecture.

The recitations will embrace a thorough drill upon the general subjects of the Regular Session, viz.: Anatomy, Chemistry, Physiology, Practice of Medicine, Materia Medica and Therapeutics, Surgery, Obstetrics, Diseases of Women and Children.

Though the Recitation and Preliminary Sessions are optional, it is hoped that all who can will avail themselves of their manifest advantages in commencing the study of medicine, or in supplementing the regular winter course.

Three Hospitals—Harper's, St. Mary's and St. Luke's—with two large free dispensaries, afford an abundance of clinical material for illustrative and practical teaching.

All lectures are delivered on Hospital grounds. The *peculiar feature* of this school is the *intimate union* between its *laboratory*, *clinical* and *didactic* instruction.

Fees.—For Preliminary and Regular Sessions: Matriculation, $5. Hospital Fees, $10. Lecture Fees, $40. Graduation, $25. Lecture Fees to third course students, $25.

For the Recitation Term the Lecture Fees are $10, to those who attend the other courses. All others are required to matriculate and take out the Hospital tickets.

All fees payable in advance to the *Secretary*.

Announcement and Catalogue, or any further information which may be desired, can be promptly obtained by addressing

LEARTUS CONNOR, M.D., Secretary,
92 Cass Street, Detroit.

SPECIAL FACTS CONCERNING

BELLADONNA PLASTER

IN RUBBER COMBINATION.

PREPARED BY

SEABURY & JOHNSON.

In undertaking the manufacture of Medicinal Plasters we had but one object in view—THE IMPROVEMENT OF ALL KINDS OF PLASTERS. Among the various plasters manufactured by us was BELLADONNA PLASTER. This article met with a larger demand than some of the others, acquired a reputation among the best druggists, and received the confidence of the profession. Its large sale interfered with rival manufacturers, and continuous efforts have been made on their part to prejudice physicians against it.

As these attacks have been of late more malicious than usual, we have deemed it advisable, in self-defence, and in order to place our article fairly before the practitioner, to assign reasons why we consider it the most thoroughly reliable preparation ever offered the medical profession. First, it is a combination of the Alcoholic Extract of Belladonna only, with purified rubber, and thus possesses all of the advantages of the rubber base, being pliable, convenient of application, and not subject to the deteriorating influence of age, as is the case when any other base is used. Secondly, it is freed from all irritative properties. Thirdly, it is more adhesive than any other plasters. Fourthly, we believe it to be as perfect, in every respect, as it is possible to make a Belladonna plaster.

ENGLISH EXTRACTS—WHY WE DO NOT EMPLOY THEM.

Imported English Extracts are prepared from the Inspissated Juice of the leaf, while our pharmacopœia formula is treated by Alcohol. The active principle of Belladonna (Atropia) is only partially obtained by Inspissation. The employment of Alcoholic or Hydro-Alcoholic Solvents completely exhausts the entire strength of the drug.

The value of both preparations is clearly presented in an able treatise published in the *American Journal of Pharmacy*, April 1876, page 145. Our own investigations are substantially identical :—

TABLE OF RESULTS,

	Test solution requisite for 100 cc. of Ext. Solution.	Percentage of Atropia in Extract.
EXT. BELLADONNÆ ALCOH. U. S. P.	*17·732*	*2·571*
GEO. ALLEN & CO., English	*9·73*	*1·411*
*HERRINGS & CO., " *	*8·133*	*1·179*
E. MERCK, Germany (aqueous extract), made 1869	*1·9*	*·275*

This analysis clearly establishes the fact that the **Alcoholic Extract of Belladonna of the U. S. P. averages over twice the strength of English Extracts,** and should, therefore, be preferred in all cases where a reliable article is desired. Inspissated and Aqueous Extracts deteriorate, while Alcoholic remain stable.

Therefore the assumption of pretentious manufacturers, that the English Extracts are the superior preparations, must be based on a former supposition rather than present facts. The following analysis substantiates our claim regarding English Extracts.

ANALYSIS OF BELLADONNA PLASTERS, BY PROF. R. OGDEN DOREMUS.

"BELLEVUE HOSPITAL COLLEGE, New York, Sept. 7, 1878.

"GENTLEMEN—I obtained from Messrs W. H. Schieffelin & Co., of this city, samples of Belladonna Plasters prepared by Grosvenor & Richards, Boston ; Mitchell Novelty Plaster Works ; Seabury & Johnson, New York and London. I have examined these varieties for the purpose of determining which possesses the largest quantity of Atropine. I employed equal surfaces of each, and *my analysis demonstrated that* SEABURY & JOHNSON'S *contains the greatest proportion* of the active principle of Belladonna. "R. OGDEN DOREMUS, M.D., L.L.D."

Belladonna Plaster, prepared by Seabury & Johnson, is packed in elegant tin cases, which contain 1 yard each, and can be obtained of almost any druggist throughout the United States and Canada, or will be furnished direct by mail. Samples sent on application.

DR. L. D. McINTOSH'S
Electric or Galvanic Belt.

If this new combination could be seen and tested by the medical profession, few, if any, words would be needed from us in its favor, for it combines utility with simplicity in such perfection that seeing it is convincing proof of its great value. The medical profession to-day acknowledge, almost universally, Electro-Therapeutics.

This combination is composed of sixteen cells, placed in pockets on a belt. Each cell is made of hard vulcanized rubber, lined with a copper cell, which constitutes the negative plate. The rubber coating perfectly insulates each cell. The positive plates are of zinc, wrapped in a porous material, to absorb the exciting fluid and prevent contact with the copper, and permit the current to pass from the copper to the zinc.

Thus the cells are charged without wetting the belt, and the discomfort following to the patient. A wire is soldered to each zinc plate, which connects with the copper cell by entering a tube on its side, thus rendering the belt pliable.

The McIntosh Electric Belt is superior to all others for the following reasons:—

It is composed of sixteen cells—thus giving a powerful current. A current selector is so arranged that one or more cells can be used at pleasure. There is not anything irritating about the Belt, as is the case with all other contrivances where the metal used is wet with weak acids and placed next to the skin. The electrodes are pieces of metal covered similar to ordinary battery electrodes, and connected with the cells by connecting cords. By this arrangement, a current from the Belt can be applied, to produce a general or local effect.

Physicians who have used this belt in their practice do not hesitate to recommend it to the profession.

Our pamphlet on Medical Electricity sent free on application. Address

HINTS IN THE OBSTETRIC PROCEDURE.

BY

WILLIAM B. ATKINSON, A.M., M.D.,

Lecturer on Diseases of Children, at the Jefferson Medical College; Physician to the Department of Obstetrics and Diseases of Women, Howard Hospital, Philad'a.

SECOND EDITION. ENTIRELY RE-WRITTEN AND ENLARGED. 12MO, CLOTH. PRICE, $1.00.

—o—

The very gratifying reception given this handbook of the essentials of the obstetrical art has led the author to submit it to a careful revision, and increase its size by adding a number of new topics.

It may safely be characterized as the most convenient, compact, reliable and handy *vade mecum* on obstetrics in the language; as the following personal and editorial statements sufficiently attest.

OPINIONS OF PHYSICIANS AND THE PRESS.

"It is really a '*multum in parvo*,' and will, I am sure, be of great service to multitudes in the profession who have hitherto followed the routine of old traditions."—*Prof. Fordyce Barker.*

"It is as good for the old as for the young practitioner."—*Dr. J. Marion Sims.*

"It abounds in extremely valuable hints, and is calculated to do much good."—*Prof. Goodell.*

"Founded upon the personal experience of the author, it must prove of value to the very wide circle of the profession who will be led to purchase it by their acquaintance with the author and his reputation."—(Philadelphia) *Medical Times.*

HORSFORD'S
Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges.

TRADE MARK
[Unguentum Petrolei]

SAMPLES FURNISHED ON APPLICATION.

THE POST-OFFICE LAWS

Forbid anything of an oleaginous nature being sent through the mail.

THEOPHILUS REDWOOD, Ph.D., F. C. S., Professor of Chemistry and Pharmacy to the Pharmaceutical Society of Great Britain, says, in reference to this preparation:—

"UNGUENTUM PETROLEI appears to be obtained from crude Petroleum by fractional distillation and subsequent purification. Products of a similar description have been introduced in pharmacy, and recommended as substitutes for animal or vegetable fats in the preparation of ointments or liniments.

"Among these the UNGUENTUM PETROLEI is distinguished by its having a firmer consistence and a higher melting point, and in these respects it resembles pure lard, from which it differs in that it is entirely free from liability to become rancid or to undergo any chemical change. It has an amber color, and a smooth, jelly-like appearance and is almost wholly free from odor or taste. It is free from, and insoluble in, water. It is very slightly soluble in rectified spirit, but very soluble in ether, in fixed oils and fats. I am of opinion that its characters and properties are such as to render it a valuable adjunct to our Materia Medica."

Dr. TILBURY FOX, London, writes:—"I like the UNGUENTUM PETROLEI very much indeed, and shall not fail to prescribe it."

From "THE LANCET," London, October 20th, 1878.—"Semi-transparent, pale yellow in color, and perfectly free from offensive smell. We consider it a valuable preparation, and hope its use will become as common in England as it is said to be in America."

From "THE MEDICAL TIMES AND GAZETTE," London, October 20th, 1878.—"The substance introduced under the name of UNGUENTUM PETROLEI is of about the consistence of good lard, has no smell, keeps any length of time, apparently without becoming rancid, and may be exposed to any kind of atmosphere without undergoing chemical change. It has long been, we understand, in use in America, where it enjoys a wide-spread popularity; and it will, we doubt not, come into extensive use here also, as a vehicle for making ointments, as a demulcent in various diseases of the skin, and as a lubricant."

THE WEEKLY
MEDICAL AND SURGICAL REPORTER.

THE MEDICAL AND SURGICAL REPORTER has been established over thirty years, and has, it is believed, a *bona fide* subscription list unsurpassed by any medical weekly in America.

It is issued every Saturday, neatly cut and bound, and gives 24 large octavo, doubled-columned pages of reading matter in each number. It claims the following

SPECIAL FEATURES:

IT IS INDEPENDENT, being controlled by no clique, college, society or publishing house.

COSMOPOLITAN. Having subscribers and contributors in every State in the Union, it is edited in the interest of the *whole profession*, not of one section or locality.

EMINENTLY PRACTICAL. Special prominence is given to Diagnosis and Therapeutics—the *recognition* and the *treatment* of disease, the real *business* of the professional man.

UNSURPASSED IN CHEAPNESS. When the *size* and *number* of its pages, and its frequency of issue are taken into account, it gives more matter for the money than any other medical journal in this country.

PARTICULARLY SUITED TO COUNTRY PHYSICIANS. It has always been a special aim of the editor to furnish a journal that would keep a reader remote from medical centres *fully up to the times* in his profession. Every surgical invention and new remedy of value, every medical book of moment, every professional discussion or news item of interest, will be found recorded in its pages. *Contributions* from country physicians are always welcome.

THE HALF-YEARLY COMPENDIUM

Appears on January 1st and July 1st of each year, forming two semi-annual volumes of 300 large octavo pages each, with complete Index. It has been established ten years, with a constantly growing circulation.

☞ While complete in itself, it is also intended as a **Companion Journal to the Medical and Surgical Reporter**; it is made up from articles *which have not been included* in the latter. The one journal is the Complement of the other.

From 600 to 700 separate articles appear each year in its various departments, carefully prepared, and giving the choicest selections from all sources, American and Foreign. It is the *only* work of the kind which does justice to *American* writers in medicine.

The Physician's Daily Pocket Record,

COMPRISING A VISITING LIST, MANY USEFUL MEMORANDA, TABLES, Etc.

By S. W. BUTLER, M.D.

Edited Annually, and Adapted for 35 or 70 Patients Daily. Strongly Bound in Morocco, with Steel Spring Clasp.

PRICE: { Edition for 35 Patients Daily, - - $1.50
" 70 " " - - 2.00

☞ The name of the purchaser will be stamped in gilt letters on the tuck, for 10 cents extra. ☜

IMPORTANT TO PHYSICIANS!

The fact that Sulphate of Quinine is only soluble in over 700 parts of water is not generally known, or if known is not usually considered, except in prescriptions, when this difficulty is overcome by the addition of Acid; and the further fact that **Bi-Sulphate of Quinine** is soluble in **only 10 parts of water** is as little appreciated.

McKesson & Robbins have paid much attention to the subject of putting Quinine into Pills, in a condition approaching that of a solution, and have at last succeeded in their **BI-SULPHATE OF QUININE PILLS,** and offer the same to the profession, confident that they will stand any test for solubility and prompt action. Physicians will please always specify **McK. & R. Bi-Sulph. Quinine Pills,** and they will not be disappointed in results.

Note.--With no reference to *respectable* druggists, we would say that cases have come to our knowledge and have been noted, where other pills have been substituted on prescriptions for ours.

POWDERED PURIFIED CHINOIDINE.

Containing all the Non-Crystalizable Alkaloids of Cinchona Bark.

Similar preparations have been lately offered in market AT HIGH PRICES under different fancy appellations, and claims made for the same as of equal efficiency with Quinine.

As a great demand exists for a cheap anti-malarial remedy, we introduce this preparation at low figures; and, in order that the profession may judge practically of its merits, will forward a sample to any physician's address, or mail one ounce upon receipt of FIFTY CENTS.

Yours respectfully,

McKESSON & ROBBINS,

Wholesale Druggists and Manufacturing Chemists,

91 FULTON ST., NEW YORK.

GRANULATED EFFERVESCENT SALTS

PREPARED BY

WILLIAM R. WARNER & CO.,

CHEMISTS,

PHILADELPHIA.

Granulated Effervescent

VICHY SALT.

(Grand Grille.)

A large teaspoonful dissolved in half a glass of water, forms a grateful and refreshing draught, identical with the natural water. Per dozen, $4.00

Granulated Effervescent

SELTZER SALT.

A tablespoonful to half a glass of water forms a grateful and refreshing saline draught, identical with the natural water. Per Dozen, $4.00

Granulated Effervescent

SEIDLITZ MIXTURE.

(Seidlitz Powder, U. S. P.)

An excellent aperient and refrigerant, very acceptable to the stomach. Per doz. $4.00

DOSE.—One tablespoonful in a glass of water.

Granulated Effervescent

NITRATE of POTASSIUM.

A dessert-spoonful in glass of water makes an excellent mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

CITRATE OF POTASSIUM.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $5.00

Granulated Effervescent

Bi-Carbonate of Potassium.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

Pepsin, Bismuth and Strychnia.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin, soluble Citrate of Bismuth, and the sixtieth grain of Citrate of Strychnia. Per dozen, $10.00

Granulated Effervescent

PEPSIN AND BISMUTH.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin and soluble Citrate of Bismuth. Per doz. $9.00

Granulated Effervescent

CITRATE OF MAGNESIA.

(Pleasant and Efficient.)

For a purgative effect, take two or more tablespoonfuls added to a small glass of water, and drink while effervescing. As a laxative, one or more tablespoonfuls taken in the same manner. One or two teaspoonfuls in sweetened water, produces a delightful, cooling drink in summer. Per dozen, $4.00

Granulated Effervescent

CITRATE LITHIA.

Each drachm or teaspoonful contains four grains of the chemically pure salt. Valuable in Rheumatic, Gouty and Analogous disorders. Per dozen, $10.00

Granulated Effervescent

KISSINGEN SALT.

A large teaspoonful dissolved in half a glass of water, forms an agreeable and refreshing draught identical with the natural water. Per dozen, $4.00

Granulated Effervescent

CRAB ORCHARD SALT.

Prepared from the exact analysis of the purified natural salt, obtained from the Crab Orchard Spring, Ky.

A tablespoonful in half a glass of water forms a grateful effervescing draught, producing the effect of the natural water. Per dozen, $4.00

Granulated Effervescent

OXALATE OF CERIUM.

Each drachm or large teaspoonful contains two grains of Oxalate of Cerium. Per dozen, $5.00

Granulated Effervescent

CITRATE CAFFEINE.

A dessert-spoonful containing one grain of Citrate of Caffeine should be given for sick headache, every hour or two before and during the paroxysms. Per dozen, $10.00

Physicians will please specify Warner & Co.—Equal to best English.

RELIABLE

ANIMAL VACCINE.

The undersigned respectfully announces that he has discontinued the practice of furnishing Vaccine *at his residence.*

Physicians can obtain the *Animal Vaccine* of MESSRS. CASWELL, HAZARD & CO., BROADWAY, CORNER 24TH STREET.

FRANK P. FOSTER, M.D.

By our arrangement with Dr. Foster, *all* Vaccine supplied by *us* is *absolutely fresh.*

We can furnish it in any quantity desired, either by express or by mail, if remittance is made to cover postage.

Dr. Foster's Animal Vaccine is the only kind that may be said to have the unqualified endorsement of the Medical Profession of New York.

QUILL SLIPS (half quill, charged on convex surface, at square-cut end).....**25 cts.**
CAPILLARY TUBES.....**$2 00**

For ordinary use *Quill Slips* are the most reliable of all forms of stored Vaccine, and in cases of failure with them in *primary* vaccination, if used within one week of their issue, and strictly in accordance with the printed directions, *being in the meantime kept cool and dry*, a second supply will be furnished gratis.

Tubes are intended chiefly for transportation to long distances, as the virus is preserved for a considerable length of time. They are superior to crusts, but inferior to quill slips.

Crusts are not recommended, and are not sold, for the reason that, however fresh, and however well formed they may be, they are apt to prove inefficient.

CASWELL, HAZARD & CO., New York.

APOLLINARIS WATER.

HIGHLY EFFERVESCENT.

Approved by the Academy of Medicine of France, and its Sale in France as a Natural Mineral Water authorized by Special Decree of the French Government.

"The Exquisite Apollinaris."—Dr. J. Milner Fothergill. "Queen of Table Waters."—Lon. Med. Record.

APOLLINARIS WATER has been the subject of the most favorable reports from Professors Fordyce Barker, Ogden Doremus, Austin Flint, W. A. Hammond, Loomis, F. N. Otis, E. R. Peaslee, Sayre, Marion Sims, James R. Wood, New York, etc., etc.

APOLLINARIS	Used habitually as a table water, its pleasant taste and richness in pure carbonic acid favorably distinguish it from the other similar mineral waters.—Prof. Dr. VIRCHOW, *Member of the German Parliament, and Professor University of Berlin.*
APOLLINARIS	EXCEPTIONALLY VALUABLE and PLEASANT as a table-water in HYGIENIC as well as DIETETIC respects; maintains its FRESHNESS on the PALATE when constantly used.—Prof. Dr. OSCAR LIEBREICH, Berlin.
APOLLINARIS	I have for many years always obtained the best success with this water in cases of severe DISORDERS of the DIGESTION; in PHTHISIS, during CONVALESCENCE from severe Illnesses, after TYPHUS PNEUMONIA, ARTICULAR RHEUMATISM, and also in DIPHTHERIA, and in the various other diseases in which it was necessary to produce a TONIC EFFECT upon the STOMACH and the DIGESTION. I have of late almost EXCLUSIVELY EMPLOYED IT.—Prof. Dr. OERTEL, Munich, *Author of Treatise on Diphtheria, &c., Ziemssen's Cyclopædia.*
APOLLINARIS	REFRESHING, PROMOTES DIGESTION, and is especially to be recommended as an adjuvant in the following morbid conditions: DYSPEPSIA characterized by ACIDITY of the STOMACH, GASTRO-ENTERALGIA, tendency to GALL-STONES, GOUTY conditions, CATARRHAL affections of the GENITO-URINARY MUCOUS MEMBRANE, and UTERINE CONGESTION leading to CATAMENIAL HEMORRHAGE. The habit of drinking Apollinaris Water has SAVED many from TYPHOID Fever, while their COMPANIONS drinking COMMON WATER were INFECTED.—Dr. HERMANN WEBER, *Fellow of the Royal College of Physicians, London, &c., &c.*

Further Testimonials from numerous authorities, including Professors Frankland, F.R.S., Lond.; Odling, F.R.S., Oxford; A. W. Hoffmann, F.R.S., Privy Councillor, Berlin; Kekulé, Rector of University of Bonn; Professors Ditterich, Munich; Nussbaum, Munich; Varrentrapp, Frankfort; T. K. Chambers, Physician to the Prince of Wales; Peter Hood, M.D.; Peter Squire, F.L.S., Chemist to the Queen, and others; Professors Drs. Labbé, Fauvel, A. Latour, L. Championnière, Constantin James, Lutaud, &c., France, and many others, have been published and may be obtained on application to

F. DE BARY & CO., 41 & 43 Warren St., New York.

Apollinaris Water may be had of all Wine Merchants, Grocers, Druggists, and Mineral Water dealers throughout the United States.

In corresponding with Advertisers please mention THE MEDICAL AND SURGICAL REPORTER.

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION,

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil, by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM, instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat, in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatized Cod-Liver Oil, the active digestive principle of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Pancreatine effects the digestion and assimilation of Cod-Liver Oil and Fat, as well as Food generally. This palatable and popular remedy is therefore invaluable to PATIENTS WHO ARE UNABLE TO DIGEST COD-LIVER OIL, and who are thus deprived of its nourishing and invigorating properties.

Pancreatine Wine. An excellent vehicle for taking Cod-Liver Oil and promoting the digestion of it.

Tins, 1*s*, 2*s*, 5*s*, 10*s*.

AS SUPPLIED TO

SAVORY & MOORE, 143 New Bond Street, London.

Agents for America, E. FOUGERA & CO., NEW YORK.

NEW HYPODERMIC SYRINGES.

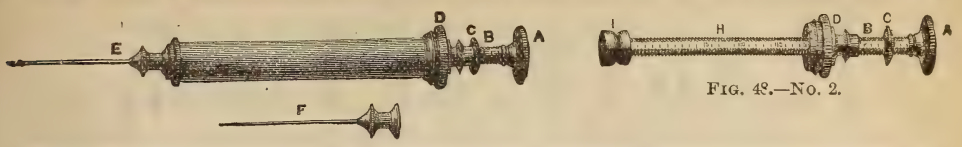

FIG. 48.—No. 2.

These cuts (two-thirds the actual size) represent a New Hypodermic Syringe of our Manufacture. With the exception of the needles, it is of German Silver, a material chosen as possessing, next to steel, the greatest rigidity and durability, while free from liability to oxydation. The barrel is formed by a process peculiar to ourselves, securing uniformity of calibre without soldered joint or seam. It is plated inside and outside with nickel. The piston is packed in the double parachute form, with leather prepared expressly for the purpose. It will be found to retain its elasticity, to operate smoothly, to resist all tendency of fluid to pass above, as of air below it. A nicely-engraved scale upon the piston-rod indicates minims, thirty being the capacity of the syringe.

Syringes Nos. 2, 3, and 4 have also a screw thread upon the piston-rod, and a traverse nut, thereby favoring the utmost nicety in the graduation of doses.

No. 3, Compact, has hollow piston-rod to receive one needle, also a protecting cover and fluid retainer; it may be carried in the Pocket Instrument or Vial Case, or without any case.

No. 4, Compact, is like No. 3, with the addition of a second needle, carried upon the syringe in the usual place, protected by a metal shield.

Nos. 1 and 2 are put up in neat morocco-covered case, with vial.

Two sizes of needles are furnished with each instrument, Nos. 1, 2, and 4; one only with No. 3. They are of refined steel, carefully tempered, and thoroughly plated with gold; they are of small diameter and large relative calibre, sharpened to such an angle as will offer least resistance to penetration, and therefore cause least pain. At the point of union with the socket they are reinforced with an outer covering of German silver, thereby overcoming the tendency to become broken at this place. They are connected with the barrels by a screw thread.

Prices: No. 1, *$3 50* No. 2, *$4.00* Postage, .03
" No. 3, *2.50* No. 4, *3.50* " .02

No. 3.

These Syringes are so thoroughly and strongly made as to be free from the annoying accidents common to most Hypodermic Syringes; and we believe that, for convenience, durability, and nicety of construction, they have no superior.

OTHER HYPODERMIC SYRINGES.

		Postage.
No. 7, glass-barrel, graduation engraved on barrel, with screw nut on piston, nickel-plated mountings, two best steel gilt needles, in neat case	*$3.00*	.02
No. 9, glass, graduation engraved and numbered on piston-rod, with screw nut, best steel gilt needles, in neat case	*3.00*	.02
No. 7 or No. 9, with two steel unplated needles, either	*2.50*	.02
No. 10, glass, Luer's (French), graduation as No. 9, one gold needle and two steel needles, silver mountings, neat velvet-lined morocco case	*12.00*	.02

No. 11, glass cylinder, fenestrated, nickel-plated metal mounting (see cut).

No. 11.

		Postage.
As represented in the cut, the glass cylinder is encased in a metal mounting, fenestrated to show the graduations for minims. The instrument may readily be taken apart for cleaning, and for those who prefer glass, is recommended for its non-liability to breakage. Price, with two best steel gilt needles, in a neat case	*$3.50*	.02

☞ *Any of the above will be sent by return mail on receipt of Price and Postage.* ☜

HYPODERMIC SYRINGES OF ALL KINDS PROMPTLY REPAIRED.

Our new *Illustrated Catalogue of Surgical Instruments,* also a new Pamphlet on Inhalation of Atomized Liquids, by distinguished medical authority, with many valuable formulas, will be forwarded, postpaid, on application.

Atomizers and articles for Antiseptic Surgery, Aspirators, Clinical Thermometers, Elastic Hose, Electrical Instruments, Invalids' Articles, Manikins, Models, Ophthalmoscopes; Dr. Paquelin's Thermo-Cautery; Pessaries, Rubber Urinals; Sayre's Splints, and Apparatus for every kind of Deformity; Skeletons, Sphygmographs, Splints, Transfusion Apparatus; Vaccine Virus from our own stables; Veterinary Instruments; Waldenburg's Pneumatic Apparatus, &c., &c.

CODMAN & SHURTLEFF,

Makers and Importers of Superior Surgical Instruments,

1140-1191eow **13 & 15 TREMONT STREET, BOSTON, MASS.**

TO THE MEDICAL PROFESSION.

LACTOPEPTINE,

The most important remedial agent ever presented to the Profession for Indigestion, Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all diseases arising from Imperfect Nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase, or Veg. Ptyalin, Lactic and Hydrochloric Acids, in Combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk.....40 ounces.	Veg. Ptyalin or Diastase.....4 drachms.
Pepsin.....8 ounces.	Lactic Acid.....5 fl. drachms.
Pancreatine.....6 ounces.	Hydrochloric Acid.....5 fl. drachms.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its almost universal adoption by the Profession is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned having tested LACTOPEPTINE, recommend it to the Profession:—

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

LEWIS A. SAYRE, M.D.,
Professor of Orthopædic Surgery and Clinical Surgery, Bellevue Hospital Medical College.

F. LE ROY SATTERLEE, M.D., PH.D.,
Professor of Chem., Mat. Med. and Therap. in the N. Y. College of Dent.; Prof. of Chem. and Hygiene in the Am. Vet. College, etc., etc.

SAMUEL R. PERCY, M.D.,
Professor Materia Medica, New York Medical College.

A. VAN DEVEER, M.D.,
ALBANY, N. Y., June 8th, 1878.
Prof. of the Prin. and Prac. of Surg., Albany Med. Col.; Surg. Albany and St. Peter's Hospitals.
"I have given LACTOPEPTINE a good thorough trial, and have been greatly pleased with the excellent results that have followed its administration."

JOHN H. PACKARD, M.D.,
PHILADELPHIA, PA., May 30th, 1878.
Pres't Phila. Co. Obstet. Society; Surg. Episcopal and Women's Hospitals.
"I have found great satisfaction in the use of LACTOPEPTINE, and have ordered it frequently in cases of Dyspepsia, especially where there is want of tone and defective secretion."

JAS. AITKEN MEIGS, M.D.,
PHILADELPHIA, June 20th, 1878.
Prof. of the Institutes of Med. and Med. Juris., Jeff. Medical College; Phy. to Penn. Hos.
"I have used LACTOPEPTINE with very good effect in a number of cases of Dyspepsia."

W. W. DAWSON, M.D.,
CINCINNATI, O., June 21st, 1878.
Prof. Prin. and Prac. Surg., Med. Col. of Ohio; Surg. to Good Samaritan Hospital.
"I have used LACTOPEPTINE with great advantage in cases of feeble digestion."

ALBERT F. A. KING, M.D.,
WASHINGTON, D. C., June 19th, 1878.
Prof. of Obstetrics, University of Vermont.
"I have used LACTOPEPTINE both in hospital and private practice, and have found it to answer fully the purposes for which it is recommended. As an immediate aid to the digestive function, I know of no remedy which acts more directly."

D. W. YANDELL, M.D.,
LOUISVILLE, KY., March 7th, 1878.
Prof. of the Science and Art of Surg. and Clinical Surg., University of Louisville.
"I have made much use of LACTOPEPTINE, and take great pleasure in stating that it has rarely disappointed me. I shall, of course, continue to prescribe it."

ROBT. BATTEY, M.D.,
ROME, GA., June 8th, 1878.
Emeritus Prof. of Obstetrics, Atlanta Med. College, and Ex-Pres. Med. Association of Ga.
"I have used LACTOPEPTINE in a case of Dyspepsia with satisfaction. I think well of it."

CLAUDE H. MASTIN, M.D., LL.D.,
MOBILE, ALA., June 8th, 1878.
"I consider LACTOPEPTINE the very best preparation of the kind which I have ever employed, and for patients with feeble digestion I know of nothing that is equal to it."

Prof. H. C. BARTLETT, PH.D., F.C.S.,
LONDON, ENG., February 22d, 1876.
"I find the preparation of LACTOPEPTINE contains within itself all the principles required to promote a healthy digestion.

PRICE LIST.

LACTOPEPTINE (in oz. bottles).....per oz. $1.00
" (" ").....per doz. 10.00
" (in ½ lb ").....per lb. 12.00

We also prepare the various Elixirs and Syrups, in combination with Lactopeptine.

THE NEW YORK PHARMACAL ASSOCIATION,

NOS. 10 and 12 COLLEGE PLACE, NEW YORK.

P. O. BOX 1574. 1140-1191eow

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt. and all its combinations.

Extract of Malt,

WITH COD-LIVER OIL,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO,

(See Transactions of American Medical Association, for 1876, page 176.)

Is presented to the medical profession as an efficient, palatable and very stable combination, consisting of equal parts of the ***Extract of Canadian Barley Malt*** and the best quality of genuine ***Norwegian Cod-liver Oil.*** Many patients take this preparation who cannot take the oil in any other form. It may be employed in all cases where Cod-liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

Extract of Malt,

WITH COD-LIVER OIL AND PHOSPHORUS,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod-liver Oil, Phosphorus being added in the proportion of $\frac{1}{100}$ grain to the dose, and so combined as to be perfectly protected from oxidation. The ***Trommer Extract of Malt Company*** prepare this combination agreeably to the suggestion of ***Dr. Wilson Fox.*** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

Extract of Malt,

WITH COD-LIVER OIL AND IODIDE OF IRON

added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod-liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians, referring to it in terms of high praise.

1090-1115eow

NOW READY.

LESSONS IN GYNECOLOGY.

BY WM. GOODELL, A.M., M.D.,

Professor of Clinical Gynecology in the University of Pennsylvania.

With Numerous Illustrations

1 Vol., 8vo. Price, Cloth, $3.00.

This entirely new and complete work by this distinguished author cannot fail to prove a valuable addition to gynecological literature. The following table of contents will indicate its scope:—

Lesson	I.	Gynecological Instruments.
"	II.	Caruncle, and other Affections of the Female Urethra.
"	III.	Vesical Dis ases of Women.
"	IV.	Fistulæ of the Female Genital Organs.
"	V.	Closure of the Vulva for Incurable Vesico-vaginal Fistulæ—Tumors of the Vulva.
"	VI.	On the Causes, Prevention, and the Cure of Lacerations of the Female Perineum; the Primary Operation.
"	VII.	Secondary Operation for Laceration of the Female Perineum.
"	VIII.	Local and Constitutional Treatment for Chronic Metritis and Endometritis.
"	IX.	Retroversions and Retroflexions of the Womb.
"	X.	Anteversions and Anteflexions of the Womb.
"	XI.	Dilatation of Cervical Canal; Rapid Dilatation; Tents.
"	XII.	On the Use of the Closed Lever Pessary, and of the Intra-uterine Stem Pessary.
"	XIII.	Different Kinds of Pessaries; Abdominal Supporters.
"	XIV.	Prolapse of the Womb; Prolapse from Simple Descent; Prolapse from Hypertrophic Elongation of the Infra-vaginal portion of Cervix.
"	XV.	Prolapse of the Womb from Hypertrophic Elongation of the Supra-vaginal Portion of the Cervix.
"	XVI.	Laceration of the Cervix Uteri.
"	XVII.	Cancer of the Womb.
"	XVIII.	Vegetations of the Endometrium.
"	XIX.	Polypus of the Womb.
"	XX.	Fibroid Tumors of the Womb.
"	XXI.	Treatment of Fibroid Tumors of the Womb.
"	XXII.	Spaying for Fibroid Tumors, and for other Diseases of the Womb.
"	XXIII.	Ovarian Cyst; its Diagnosis, and its Treatment by Tapping, by injections of Iodine, and by Drainage.
"	XXIV.	Ovariotomy by Abdominal Section.
"	XXV.	Vaginal Ovariotomy.
"	XXVI.	Nerve-tire and Womb-ills, or the Relation which the Nerves bear to the Diseases of Women.
"	XXVII.	The Prevention of Uterine Disorders.
"	XXVIII.	The Sexual Relations as Causes of Uterine Disorders.

These subjects are presented in a novel and attractive literary form, from the riches of an uncommonly wide clinical experience. Dr GOODELL'S operative procedures are generally marked by strong originality and much ingenuity; while his therapeutical plans are the result of very carefully studied observation. As a lecturer and teacher he is well-known to all students of his specialty, and the present volume is the only one he has published on the subject, and therefore the only source from which to derive a knowledge of his methods.

UNIVERSITY of MICHIGAN.

DEPARTMENT OF MEDICINE AND SURGERY.

The 30th annual course of lectures will commence on October 1st, 1879, and continue *nine months*.

Course separate, but equal, for women.

Matriculation Fee, *paid but once*—Residents of Michigan, $10; non-residents, $25. Annual Dues—Residents of Michigan, $20; non-residents, $25. Graduation Fee—for all alike, $10.

FACULTY.

James B. Angell, LL. D., President, Alonzo B. Palmer, M.D., Professor of Pathology and the Practice of Medicine, Corydon L. Ford, M.D., Prof. of Anatomy and Physiology. Albert B. Prescott, M.D., Professor of Organic and applied Chemistry and Pharmacy. George E. Frothingham, M.D., Professor of Materia Medica, Ophthalmology and Otology. Donald Maclean, M.D., Professor of Surgery. Edward S. Dunster, M.D., Professor of Obstetrics and Diseases of Women and Children. John W. Langley, M.D., Professor of General Chemistry and Physics. Will. J. Herdman, M.D., Demonstrator of Anatomy. Charles H. Stowell, M.D., Instructor in Physiological Laboratory. Victor C. Vaughan, PH.D., Instructor in Medical Chemistry.

Send for Circular and Catalogue.

A. B. PALMER, M.D., DEAN, Ann Arbor, Mich.

Crusts, - - - - each 2.00

We recommend the Quills and Points in preference. Quality guaranteed. Failures replaced without charge. D. G. BRINTON, 115 S. 7TH ST., PHILA.

CLOTH CASES FOR BINDING THE REPORTER, can be had at this office. Price 25 cts. each, by mail. Each case is neatly lettered, and fits one volume. tf.

In corresponding with Advertisers please mention THE MEDICAL AND SURGICAL REPORTER.

BARON LEIBIG, the greatest authority on Infant Diet, states that the majority of children who die under one year of age, do so from the effects of improper food, or from the improper administration of the food.

HORLICK'S FOOD.

A Concentrated Extract, prepared according to the Formula of Baron Liebig, and, unlike other Foods,

IS NOT FARINACEOUS.

It is acknowledged by Physicians to be the best Food

For Infants, Dyspeptics and Invalids.

Prof. J. Lewis Smith Says,

Speaking of **HORLICK'S FOOD:** "Being carefully prepared, according to Liebig's Formula, by Chemists fully competent, it possesses certain advantages, such as quick and easy preparation and a pleasant flavor, and is therefore highly esteemed by those who have used it." [*Page 58 of the fourth edition of a Treatise on Diseases of Infancy and Childhood. By J. Lewis Smith, M. D., etc.*—1879] Also, speaking in another place [page 647] of artificial food for infants, especially those suffering from intestinal catarrh, he says: "I prefer Liebig's, especially **HORLICK'S** preparation of it."

Report from Bellevue Hospital, New York.

In *The Hospital Gazette* for February 6th. 1879 [page 108] Dr. E. Hochheimer makes a report from BELLEVUE HOSPITAL of a case of Infantile Paralysis, which was followed by an exhausting diarrhœa—Speaking of the treatment, he says: "Her condition continued unchanged for the next three weeks; she was put upon a diet consisting principally of milk, but the diarrhœa persisted in spite of opiates and astringents."

"*Nov. 17th.—Milk was stopped, and she was put upon a diet of HORLICK'S FOOD; after this she began to mend, the diarrhœa became less and finally disappeared; she began to gain flesh, and her general condition was much improved.*"

We also beg to refer, by permission, to the following eminent medical men, who have used our Food extensively in their practice :— **Prof. DeLaskie Miller,** (Rush Medical College); **Prof. Wm. H. Byford,** (Chicago Medical College); **Prof. J. Adams Allen,** (Rush Medical College); **Drs. J. P. Oliver** and **C. P. Putnam,** (Harvard Medical School); **Prof. Gawne,** (Cleveland Medical College); and several hundred others whose testimonial letters are on file in our office.

PRICE, 75 Cents per bottle. Trial Size, 40 Cents.

BETHESDA WATER.

BELLEVUE, PA., May 21st, 1879.

W. B. HYATT, M.D.,
Marshallville, Wayne Co., Ohio.

DEAR SIR:—Your letter received this morning. Am sorry my friend Dr. S. did not think to tell you to address me at Pittsburg, and your communication would have reached me in a few hours instead of days, as I seldom call at the village P. O.

You will address your orders for BETHESDA WATER to JOSEPH FLEMING, 84 Market Street, Pittsburg, Pa., and they will receive prompt attention. I say this on account of my business acquaintance with Mr. Fleming. I will call on him in the morning, and have him send you pamphlets and any information relative to the matter he may think required.

If my testimony regarding the efficacy of Bethesda Water was required, I could cite several cases of my own personal knowledge. I am convinced that it is a specific in diseases arising from a morbid condition of the kidneys, providing, of course, that the disease has not reached a point beyond the possibility of recovery, as in the case of my late brother, and even then no figures could estimate its value in giving relief from suffering. I have a friend who was under treatment of different physicians all last fall and winter, and apparently getting worse: I persuaded him to stop the treatment and use the "water," and before he had used ten (10) gallons he was much better, and now nearly if not quite well. The doctors would diagnose Phlebitis, but there was a low specific gravity of the urine and other indications of kidney or dropsical affection, which satisfied me that he needed the effects of the "water;" and the results are as stated, and the inflamed vein is getting well, as well as general improved health. It occurs to me, the duty of physicians to investigate such things, and if they contain medicinal virtues, to make it known to suffering humanity instead of standing aloof until men in other walks of life have long recognized and demanded its use. Of course, there are so many new remedies claimed that are worthless, that there is some excuse, yet this Bethesda Water has been in use more than ten (10) years, and comparatively few physicians appear to know anything about its properties. Although you are a stranger to me, allow me to commend you, or any worthy physician who is willing to investigate and test its claimed virtues, and if found, to disseminate the knowledge among their less fortunate fellows.

Yours, truly,
W. J. THOMPSON.

P. S.—If you have occasion to address me further, send your letter to Auditor's Office, P. A. R. R., Pittsburg, Pa.

Sunnyside Medical Retreat

For Mental and Nervous Diseases, Inebriety and the Opium Habit,

FORT WASHINGTON, NEW YORK CITY.

This home, situated on the banks of the Hudson, under the management of Dr. Edward C. Mann, late Medical Superintendent of the New York State Emigrant Insane Asylum, receives cases of either sex affected with mental disorders, Inebriety or the Opium habit. The beauty of location and surroundings, handsomely furnished apartments, and the attentions and comforts of home life, all combine to make Sunnyside an attractive and popular private retreat. Applications may be made to Dr. Mann, either by mail or personally, at Fort Washington. Twelve trains daily from Hudson River Depot, 30th St., and 10th Ave. Broadway and 23d St. line of stages run direct to depot. The profession respectfully invited to call, and cordially welcomed. 1152-1y

WOMAN'S HOSPITAL MEDICAL COLLEGE

337 and 339 S. Lincoln St., Chicago.

The *Tenth Annual Course of Lectures* will commence the first Tuesday in October, 1879, and continue twenty-one weeks. The Spring Term will commence April 1st, and continue twelve weeks. College building new. Clinical and Dissecting advantages unsurpassed.

FACULTY.—William H. Byford, A.M., M.D., President, Obstetrics; T. D. Fitch, M.D., Secretary, Gynecology; Charles W. Earle, M.D., Treasurer, Diseases of Children; I. N. Danforth, M.D., Pathology; J. E. Owens, M.D., Surgery; Henry M. Lyman, A.M., M. D., Practice of Medicine; D. R. Brower, M.D., Therapeutics and Nervous Diseases; Sarah H. Stevenson, M. D., Corresponding Secretary, Physiology; D. W. Graham, A.M., M.D., Anatomy; Plymouth S. Hayes, M.D., Chemistry.

For information or announcement, address either of the Secretaries, at 125 State Street.

1141–1192 W. H. BYFORD, A.M., M.D., *President.*

Starling Medical College,

COLUMBUS, OHIO.

The Thirty-third Session of Starling Medical College will begin October 2, 1879, and continue until March, 1880. It will be preceded by a preliminary course beginning September 3, 1879. Extensive additions have recently been made to the Museum and other teaching facilities of the College.

FACULTY.—F. Carter, M.D., Dean; H. G. Landis, M.D.; J. H. Pooley, M.D.; S. Loving, M.D.; J. M. Wheaton, M.D.; E. B. Fullerton, M.D.; W. J. Conklin, M.D. (of Dayton); Alex. Dunlap, M.D.; Otto Frankenburg, M.D.

Lecture Tickets, including matriculation, $45.

College, cor. of State and Sixth Sts.; Dean's Office, 181 E. State St.

Letters of inquiry should be addressed to the Dean.

Prof. FRANCIS CARTER, M.D., Dean, Columbus, Ohio.

DR. McINTOSH'S

Natural

UTERINE SUPPORTER.

No instrument has ever been placed before the medical profession which has given such universal satisfaction. The combination is such that the Physician is able to meet every indication of Uterine Displacements. Falling Womb, Anteversion, Retroversion and Flexions are overcome by this instrument, where others fail; this is proven by the fact that since its introduction to the Profession it has come into more general use than all other instruments combined.

Among the many reasons which recommend this Supporter to the Physician is its self-adjusting qualities. The Physician after applying it need have no fear that he will be called in haste to remove or readjust it, as is often the case with rings and various pessaries held in position by pressure against the vaginal wall, as the patient can remove it at will and replace it without assistance.

The Abdominal Supporter is a broad morocco leather belt, with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen. The Uterine Support is a cup and stem made of highly polished hard rubber, very light and durable, shaped to fit the neck of the womb, with openings for the secretions to pass out; as shown by the cuts. Cups are made with extended lips, to correct flexions and versions of the womb.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, passing down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic adapt themselves to all the varying positions of the body, and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Anteversion, Retroversions, or any Flexions of the Womb, and is used by the leading Physicians with never failing success, even in the most difficult cases.

Price—to Physicians, $8.00; to Patients, $12.00

Instruments sent by mail, at our risk, on receipt of price with 16 cents added for postage, or by Express, C. O. D.

DR. McINTOSH'S NATURAL UTERINE SUPPORTER CO.,
192 JACKSON STREET, CHICAGO, ILL.

Our valuable pamphlet "Some Practical Facts about Displacements of the Womb," will be sent you free on application.

MIAMI MEDICAL COLLEGE OF CINCINNATI.

Member of the American Medical College Association.

FACULTY.

JOHN A. MURPHY, M.D., Professor of Principles and Practice of Medicine and Clinical Medicine.
WM. H. MUSSEY, M.D., Professor of Operative and Clinical Surgery and Surgical Diseases of Women.
E. WILLIAMS, M.D., Professor of Ophthalmology, Aural Surgery and Clinical Ophthalmology.
WM. CLENDENIN, M.D., Professor of Descriptive and Surgical Anatomy.
WM. H. TAYLOR, M.D., Professor of Obstetrics and Clinical Midwifery.
THOMAS H. KEARNEY, M.D., Professor of Principles of Surgery, Surgical Diseases and Clinical Surgery.
J. C. MACKENZIE, M.D., Professor of Physiology and Pathology and Clinical Medicine.
J. F. JUDGE, M.D., Lecturer on Chemistry and Toxicology.
WM. B. DAVIS, M.D., Professor of Materia Medica and Therapeutics.
BYRON STANTON, M.D., Professor of Diseases of Women and Children and Clinical Gnyæcology.
WM. H. DE WITT, M.D., Lecturer on Mental Diseases.
B. P. GOODE, M.D., Lecturer on Diseases of Children.
ROBT. SATTLER, M.D., Lecturer on Diseases of the Eye and Ear.
A. D. BENDER, M.D., Lecturer on Laryngoscopy and Diseases of the Throat, and Demonstrator of Anatomy.
C. A. LE BOUTILLIER, M.D., Lecturer on Surgical Dressings.
CHAS. W. MATHERS, M.D., Demonstrator of Anatomy.
WM. L. DUDLEY, Demonstrator of Chemistry.

The Preliminary Term of Lectures will begin September 3d, 1879, and continue one month. This Course will be one of *unusual interest and importance* to physicians as well as students.

The Regular Winter Session will begin October 1st, 1879, and continue five months. This course will consist of Didactic Lectures with Demonstrations, Recitations, Clinical and Special Instruction, involving Physical Manipulations. From five to six Didactic Lectures and Demonstrations are delivered daily, covering the general topics of Medicine and Surgery as taught in all regular medical colleges.

CLINICS.—The Faculty confidently announce that students have, in this college, unsurpassed clinical advantages. *Four Special Clinics* are held daily, in the college building (at which more than six thousand patients are examined annually), viz.: In Practice, Surgery, Gynæcology, Diseases of Children, Ophthalmology and Larnygology, in all of which advanced students have opportunities to make full examinations, especially in *Thoracic Diseases* and *Gynæcology*, and frequently to witness *Obstetric* cases. These clinics are free to students of the college. Two clinical lectures are delivered daily at the Cincinnati Hospital (near the college), during the entire college session.

The College also affords the fullest advantages in *Practical Chemistry*, *Practical Anatomy*, *Practical Physiology* and *Microscopy*.

FEES.

Matriculation fee (annually)	$ 5 00	Demonstrator's Ticket	$5 00
Regular Lecture Term	75 00	Hospital Ticket	5 00
Graduation Fee	25 00	Alumni of this institution free.	

JOHN A. MURPHY, M.D., Dean, 163 West Seventh Street.
WM. H. TAYLOR, M.D., Secretary, 329 West Seventh Street.

Chicago Medical College.

Medical Department of the Northwestern University.

SESSION OF 1879-80.

FACULTY.

N. S. DAVIS, M.D., LL.D., DEAN, } Professors of Prin-
H. A. JOHNSON, A.M., M.D., } ciples and Practice of Medicine and of Clinical Medicine.

EDMUND ANDREWS, A.M., M.D., } Professors of
RALPH N. ISHAM, M.D., } Principles and Practice of Surgery, and of Clinical Surgery.

EDWARD W. JENKS, M.D., L.L.D.,
Professor of Medical and Surgical Diseases of Women, and of Clinical Gynecology.

E. O. F. ROLER, A.M., M.D.,
Professor of Obstetrics and Diseases of Children.

SAMUEL J. JONES, A.M., M.D.,
Professor of Ophthalmology and Otology.

J. H. HOLLISTER, M.D.,
Cor. Secretary & Registrar, Professor of General Pathology and Pathological Anatomy.

J. S. JEWELL, A.M., M.D.,
Professor of Nervous and Mental Diseases.

H. P. MERRIMAN, A.M., M.D.,
Professor of Medical Jurisprudence and Hygiene.

WM. E. QUINE, M.D.,
Professor of Materia Medica and General Therapeutics.

MARCUS P. HATFIELD, A.M., M.D.,
Professor of Chemistry and Toxicology.

LESTER CURTIS, A.M., M.D.,
Professor of Histology.

R. L. REA, M.D.,
Professor of Anatomy.

HENRY GRADLE, M.D.,
Lecturer upon Physiology.

ROSWELL PARK, A.M., M.D.,
Demonstrator of Anatomy and Assistant to the Chair of Anatomy.

GRADED COURSE OF INSTRUCTION.

A graded system of medical instruction was adopted at the organization of this College, twenty years ago, and for twelve years it was the only representative of a classified course in this country. The recommendation of this method of teaching by two Medical College Conventions, by the American Medical Association, and by various State Medical Societies; and its more recent adoption by a number of other colleges, including some of the most prominent ones in the land; and its very general approval by the profession at large, afford gratifying evidence that this new departure was a movement in the right direction.

REQUIREMENTS FOR ADMISSION.

All applicants for admission are required to present evidence of graduation in some literary college, or certificates of attendance upon some scientific school or academy. If the applicant have neither diploma nor certificate, he must sustain a satisfactory examination as to his literary qualifications.

ADVANCED STANDING.

Students who have read medicine for one full year may enter upon the *Middle Course*, by sustaining satisfactory examinations upon studies embraced in the Junior Course.

Students who have read medicine for two years, including attendance upon one full course of lectures in some recognized medical college, may enter the *Senior Course*, by sustaining examinations upon the subjects embraced in the Junior and Middle Courses.

THE COLLEGE TERM.

A Preliminary course of Didactic and Clinical instruction, introductory to the general course, commences September 16th and continues till the commencement of the regular Session.

THE REGULAR COURSE of lectures commences Tuesday, September 30th, and will continue until March 30th, at which time the usual Commencement exercises will be held.

THE PRACTITIONERS' COURSE,

Designed for practitioners, will commence March 31st, 1880, following the Commencement, and will continue till April 28th. This special course is arranged to meet a very general want, and will afford special advantages for a *rapid*, yet *thorough*, practical review of the most important subjects in medicine and surgery.

CLINICAL ADVANTAGES.

Mercy Hospital, with its very perfect appointments; the Dispensary and the College clinics, offer an abundance of clinical material in every department of Medical and Surgical teaching. Over fourteen thousand patients were treated here during the *last year*.

In the Hospital every Senior student serves as dresser for an allotted term in the surgical wards, and receives a certificate to that effect.

Every Senior student has personal charge of one or more cases of obstetrics, under the immediate supervision of the Professor of obstetrics.

In the Gynecological Department, where large numbers of females apply for local treatment, each Senior student is trained by the Professor in the minute details of examination and treatment of the medical and surgical diseases of women.

PHYSIOLOGICAL LABORATORY.

Aided by the generous contributions of its alumni, this College is developing a PHYSIOLOGICAL LABORATORY, which will be opened for instruction during the present year.

PRIZES

Will be given by the Dean, for the best Thesis; by the Professor of Anatomy, a First Prize to the best Anatomist—open to all classes; Second Prize to the best Anatomist in the Junior Class; the Senn Prize, for the best Anatomical Preparation; and the Earl Prize, for the best Essay on Diseases of Children.

FEES.

Lecture Fees for the College Year, $75.00. Practitioners' Course, $30.00. Graduation Fee, $30.00. Registration Fee, $5.00. Demonstrator's Ticket, $5.00. Laboratory Ticket, $5.00. Hospital Ticket, $6.00.

For information concerning Text Books, Board, Seats in the College, requirements for Graduations, etc., consult the Annual Announcement, or address

DETROIT MEDICAL COLLEGE.

(MEMBER OF THE AMERICAN MEDICAL COLLEGE ASSOCIATION.)

SESSIONS OF 1879-'80

FACULTY.

JAMES F. NOYES, M.D.,
Emeritus Professor of Ophthalmology and Otology.

THEO. A. McGRAW, M.D., President,
Professor of Principles and Practice of Surgery and Clinical Surgery.

GEORGE P. ANDREWS, M.D.,
Professor of Principles and Practice of Medicine and Clinical Medicine.

C. B. GILBERT, M.D.,
Professor of Obstetrics, and Diseases of Women and Children.

N. W. WEBBER, M.D.,
Professor of General and Descriptive Anatomy, and Clinical Surgery.

SAMUEL P. DUFFIELD, PH.D., M.D.,
Professor of Toxicology and Medical Jurisprudence.

ALBERT B. LYONS, M.D.,
Professor of Chemistry and Director of the Chemical Laboratory.

LEARTUS CONNOR, M.D., Secretary,
Professor of Physiology and Diseases of the Eye and Ear.

H. O. WALKER, M.D.,
Lecturer on Anatomy and Genito-Urinary Diseases.

E. L. SHURLY, M.D.,
Lecturer on Materia Medica, Therapeutics and Clinical Laryngology.

HAL. C. WYMAN, M.D.,
Lecturer on Physiology.

J. G. JOHNSON, M.D.,
Lecturer on Diseases of Mind and Nervous System.

J. H. CARSTENS, M.D.,
Lecturer on Clinical Medicine.

F. A. SPALDING, M.D.,
Lecturer on Diseases of the Skin.

C. C. YEMANS, M.D.,
Lecturer on Chemistry.

E. A. CHAPOTON, M.D.,
Demonstrator of Practical Physiology and Instructor in Anatomy and Surgery.

J. W. ROBERTSON, M.D.,
Demonstrator of Practical Microscopy.

DAVID INGLIS, M.D.,
Instructor in Chemistry and Physiology.

E. B. WARD, M.D.,
Curator of Museum and Librarian.

The Collegiate Year is divided into three sessions.

Preliminary Session opens Wednesday, September 3d, 1879, and closes September 30th. The Clinics are held and the Lectures delivered by the Professors of the regular Faculty, and in the same order and frequency as during the Winter Term. Opportunity is given to dissect or work in the Chemical and Physiological Laboratories.

The Regular Session opens Wednesday, October 1st, 1879, and closes March 2d, 1880. During this term all the branches of *General Medicine* and *Surgery*, both scientific and practical, are taught with care and thoroughness. All students are daily examined on the subjects of the lectures and on their dissecting and laboratory work.

Senior students have *daily practice* in the *art of examining patients*, in forming their own diagnosis, prognosis and treatment. As this is done under the direction of the professor holding each clinic, and in the presence of the class, it constitutes an invaluable course of training.

The **Recitation Session** begins March 10th, 1880, and closes June 23d, 1880. Daily during this term will be held recitations for both Seniors and Juniors, and one or two clinics and a lecture.

The recitations will embrace a thorough drill upon the general subjects of the Regular Session, viz.: Anatomy, Chemistry, Physiology, Practice of Medicine, Materia Medica and Therapeutics, Surgery, Obstetrics, Diseases of Women and Children.

Though the Recitation and Preliminary Sessions are optional, it is hoped that all who can will avail themselves of their manifest advantages in commencing the study of medicine, or in supplementing the regular winter course.

Three Hospitals—Harper's, St. Mary's and St. Luke's—with two large free dispensaries, afford an abundance of clinical material for illustrative and practical teaching.

All lectures are delivered on Hospital grounds. The *peculiar feature* of this school is the *intimate union* between its *laboratory*, *clinical* and *didactic* instruction.

Fees.—For Preliminary and Regular Sessions: Matriculation, $5. Hospital Fees, $10. Lecture Fees, $40. Graduation, $25. Lecture Fees to third course students, $25.

For the Recitation Term the Lecture Fees are $10, to those who attend the other courses. All others are required to matriculate and take out the Hospital tickets.

All fees payable in advance to the *Secretary*.

Announcement and Catalogue, or any further information which may be desired, can be promptly obtained by addressing

LEARTUS CONNOR, M.D., Secretary,
92 Cass Street, Detroit.

1165-1190

SPECIAL FACTS CONCERNING

BELLADONNA PLASTER

IN RUBBER COMBINATION.

PREPARED BY

SEABURY & JOHNSON.

In undertaking the manufacture of Medicinal Plasters we had but one object in view—THE IMPROVEMENT OF ALL KINDS OF PLASTERS. Among the various plasters manufactured by us was BELLADONNA PLASTER. This article met with a larger demand than some of the others, acquired a reputation among the best druggists, and received the confidence of the profession. Its large sale interfered with rival manufacturers, and continuous efforts have been made on their part to prejudice physicians against it.

As these attacks have been of late more malicious than usual, we have deemed it advisable, in self-defence, and in order to place our article fairly before the practitioner, to assign reasons why we consider it the most thoroughly reliable preparation ever offered the medical profession. First, it is a combination of the Alcoholic Extract of Belladonna only, with purified rubber, and thus possesses all of the advantages of the rubber base, being pliable, convenient of application, and not subject to the deteriorating influence of age, as is the case when any other base is used. Secondly, it is freed from all irritative properties. Thirdly, it is more adhesive than any other plasters. Fourthly, we believe it to be as perfect, in every respect, as it is possible to make a Belladonna plaster.

ENGLISH EXTRACTS—WHY WE DO NOT EMPLOY THEM.

Imported English Extracts are prepared from the Inspissated Juice of the leaf, while our pharmacopœia formula is treated by Alcohol. The active principle of Belladonna (Atropia) is only partially obtained by Inspissation. The employment of Alcoholic or Hydro-Alcoholic Solvents completely exhausts the entire strength of the drug.

The value of both preparations is clearly presented in an able treatise published in the *American Journal of Pharmacy*, April 1876, page 145. Our own investigations are substantially identical :—

TABLE OF RESULTS,

	Test solution requisite for 100 cc. of Ext. Solution.	Percentage of Atropia in Extract.
EXT. BELLADONNÆ ALCOH. U. S. P.	*17·732*	*2·571*
GEO. ALLEN & CO., English	*9·73*	*1·411*
*HERRINGS & CO., " *	*8·133*	*1·179*
E. MERCK, Germany (aqueous extract), made 1869	*1·9*	*·275*

This analysis clearly establishes the fact that the **Alcoholic Extract of Belladonna of the U. S. P. averages over twice the strength of English Extracts,** and should, therefore, be preferred in all cases where a reliable article is desired. Inspissated and Aqueous Extracts deteriorate, while Alcoholic remain stable.

Therefore the assumption of pretentious manufacturers, that the English Extracts are the superior preparations, must be based on a former supposition rather than present facts. The following analysis substantiates our claim regarding English Extracts.

ANALYSIS OF BELLADONNA PLASTERS, BY PROF. R. OGDEN DOREMUS.

"BELLEVUE HOSPITAL COLLEGE, New York, Sept. 7, 1878.

"GENTLEMEN—I obtained from Messrs W. H. Schieffelin & Co., of this city, samples of Belladonna Plasters prepared by Grosvenor & Richards, Boston ; Mitchell Novelty Plaster Works ; Seabury & Johnson, New York and London. I have examined these varieties for the purpose of determining which possesses the largest quantity of Atropine. I employed equal surfaces of each, and *my analysis demonstrated that* SEABURY & JOHNSON'S *contains the greatest proportion* of the active principle of Belladonna. "R. OGDEN DOREMUS, M.D., L.L.D."

Belladonna Plaster, prepared by Seabury & Johnson, is packed in elegant tin cases, which contain 1 yard each, and can be obtained of almost any druggist throughout the United States and Canada, or will be furnished direct by mail. Samples sent on application.

HORSFORD'S

Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

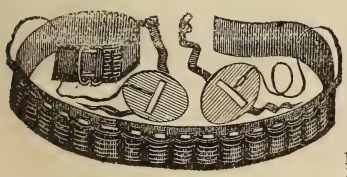
Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges.

MANUFACTURED BY THE

RUMFORD CHEMICAL WORKS,

1155-1206 PROVIDENCE, R. I.



DR. L. D. McINTOSH'S

Electric or Galvanic Belt.

If this new combination could be seen and tested by the medical profession, few, if any, words would be needed from us in its favor, for it combines utility with simplicity in such perfection that seeing it is convincing proof of its great value. The medical profession to-day acknowledge, almost universally, Electro-Therapeutics.

This combination is composed of sixteen cells, placed in pockets on a belt. Each cell is made of hard vulcanized rubber, lined with a copper cell, which constitutes the negative plate. The rubber coating perfectly insulates each cell. The positive plates are of zinc, wrapped in a porous material, to absorb the exciting fluid and prevent contact with the copper, and permit the current to pass from the copper to the zinc.

Thus the cells are charged without wetting the belt, and the discomfort following to the patient. A wire is soldered to each zinc plate, which connects with the copper cell by entering a tube on its side, thus rendering the belt pliable.

The McIntosh Electric Belt is superior to all others for the following reasons:—

It is composed of sixteen cells—thus giving a powerful current. A current selector is so arranged that one or more cells can be used at pleasure. There is not anything irritating about the Belt, as is the case with all other contrivances where the metal used is wet with weak acids and placed next to the skin. The electrodes are pieces of metal covered similar to ordinary battery electrodes, and connected with the cells by connecting cords. By this arrangement, a current from the Belt can be applied, to produce a general or local effect.

Physicians who have used this belt in their practice do not hesitate to recommend it to the profession.

Our pamphlet on Medical Electricity sent free on application. Address

McINTOSH GALVANIC BELT AND BATTERY CO.,

Dextro-Quinine in Intermittent Fever.

Case.	Name and Sex of Patient.	Age, etc.	Number of Paroxysms before taking.	Number of Paroxysms after.	Dose and Mode of Exhibition.	Total amount Exhibited.	Remarks, Pathological and Physiological Phenomena, etc.	Reported by
1	J. S. S.	27	14	0	10 grs. at bedtime.	30 grs.	I have found Dextro-Quinine fully equal to the Sulphate of Quinia, with almost none of the disagreeable symptoms of the latter.	F. C. Hageman, M.D., Seaford, L.I.
2	D. V. W.	14	5	0	8 grs. at bedtime.	24 grs.		
3	Emma L.	16	60 or more.	0	5 grs. every three hours, in glycerine, without intermission, only during febrile exacerbations, etc.	30 grs.	Patient was very much prostrated with typho-malarial fever; been under the care of another physician; was called in on the third week. I then prescribed 5 grs. of Dextro-Quinine every three hours, in glycerine, when, as it were by magic, all the grave symptoms abated at once, and the patient made a rapid recovery.	Alex. F. Joseph, M.D., Napoleon, Ind.
21	Mrs. S., *Double Quotidian.* Had taken large doses Cinchonidia sulphate without effect.	22 Brunette. Married. No children.	6	0	20 grs. divided into chart. No. v, one every two hours.	20 grs.	Had first paroxysm Nov. 20, 6 A.M., again at 4 P.M. Presented Cinchonidia sulphate, grs. xxx, chart. No. v. One to be taken every two hours. Nov. 21. Return of paroxysm at 6 A.M. and 4 P.M. Gave Cinchonidia sulphate, grs. xlv, chart. No. v. One to be taken every two hours. Nov. 22. Return of paroxysm at same time as on preceding days. Prescribed Dextro-Quinine, grs. xx, chart. No. v. One to be taken every two hours. No return of chill since that date, and highly pleased with my experience.	N. H. Manring, M.D., Rigdon, Ind.
15	I. de L., female. *Tertian.* Habituated to Quinia.	19 Married.	2	0	15 grs. in 3 doses of 5 grs., taken at intervals of ½ hour, commencing four hours before expected paroxysm. Taken in capsule.	15 grs.	Dilatation of pupil; tinnitus aurium severe, but not so much so as on former occasions when Sulphate of Quinia was used. Directed her to take 10 grains on the third day, but she did not do so. Twelve days have elapsed without return of chills. Is taking citrate of iron and strychnia.	
16	Jennie S., colored. *Quotidian.* Has "used Quinine and everything else," as she herself expressed it.	25 Married.	Unknown, but a very large number.	1	16 grs. in 4 doses, in capsule, with 1-16 gr. Morph. acet., to be taken at ½ hour intervals, commencing four hours before expected paroxysm.	48 grs.	On first evening after exhibition of Dextro-Quinine had a very slight ague, followed by considerable fever, which, however, soon passed off. Gave Hydrarg. Chlor. Mite, grs. x, at bedtime, which caused three or four operations of the bowels. The Dextro-Quinine was continued the next day. *Missed chill for first time in over a month.* Thought it best to continue medicine (without Morphia) another day. Has had no return up to to-day (10 days). Did not complain of tinnitus.	Frank S. James, Ph.D., M.D., Osceola, Ark.
5	Mary B.	3½	3	0	1 gr., in solution, every three hours.	16 grs.	Commenced the Dextro-Quinine just after last paroxysm; it acted excellently. It is now more than four weeks since she took the remedy; there has been no return. She is now in the enjoyment of good health.	G. H. Berry, M.D., New York City.
6	Edward Libby. *Tertian.*	24	9 or 10	0	Two 12-grain doses at half-hour intervals.	24 grs.	Had been taking Sulphate of Quinia in 5-gr. doses for some time, with little or no effect. Has had no chill since the Dextro-Quinine was administered (more than a month having elapsed), and the result is entirely satisfactory.	H. A. Weymouth, M.D., Saco, Me.
11	Mary Cavanough. *Quotidian.*	3	One a day for six months.	0	2 grs. in powder, every two to three hours.	15 grs.	Little girl had been complaining with chills and fever for over six months; had used Sulphate of Quinia, Tincture Cinchona, Cincho-Quinine, etc. *Had taken great quantities of Sulphate of Quinia, without effecting a cure. I gave in all about 15 grs. of Dextro-Quinine, and she never has had any chill since.* This one case in particular I think a remarkable one. The little girl had had chills regularly, almost every day, for over six months, had been treated by two physicians, and a cure could not be effected, as they and the family thought, under any circumstances. I was called directly after, and gave 2 grs. *Dextro-Quinine*, in powder, every two to three hours, and to my great surprise, as well as every one else's, she failed to have any more chills. I then put her on a tonic of iron, and she is now enjoying good health. I consider the Dextro-Quinine far superior to any of the preparations of Quinine, and, from what I have seen of its medicinal effects, I do not hesitate to recommend it as superior to all other remedies in Remittent and Intermittent Fevers.	J. H. Struble, M.D., Stanhope, N. J.

DEXTRO-QUININE sent by mail, at the rate of $1.60 per ounce, to Physicians who cannot be supplied by their local Druggists. Address

KEASBEY & MATTISON, Philadelphia.

In corresponding with Advertisers please mention THE MEDICAL AND SURGICAL REPORTER.

BE CAREFUL TO SPECIFY McKESSON & ROBBINS'.

SPECIFY McKESSON & ROBBINS Oval Shape, Complete Coating.

IMPORTANT TO PHYSICIANS!

The fact that Sulphate of Quinine is only soluble in over 700 parts of water is not generally known, or if known is not usually considered, except in prescriptions, when this difficulty is overcome by the addition of Acid; and the further fact that **Bi-Sulphate of Quinine** is soluble in **only 10 parts of water** is as little appreciated.

McKesson & Robbins have paid much attention to the subject of putting Quinine into Pills, in a condition approaching that of a solution, and have at last succeeded in their **BI-SULPHATE OF QUININE PILLS,** and offer the same to the profession, confident that they will stand any test for solubility and prompt action. Physicians will please always specify **McK. & R. Bi-Sulph. Quinine Pills,** and they will not be disappointed in results.

Note.--With no reference to *respectable* druggists, we would say that cases have come to our knowledge and have been noted, where other pills have been substituted on prescriptions for ours.

POWDERED PURIFIED CHINOIDINE.

Containing all the Non-Crystalizable Alkaloids of Cinchona Bark.

Similar preparations have been lately offered in market AT HIGH PRICES under different fancy appellations, and claims made for the same as of equal efficiency with Quinine.

As a great demand exists for a cheap anti-malarial remedy, we introduce this preparation at low figures; and, in order that the profession may judge practically of its merits, will forward a sample to any physician's address, or mail one ounce upon receipt of FIFTY CENTS.

Yours respectfully,

McKESSON & ROBBINS,

Wholesale Druggists and Manufacturing Chemists,

91 FULTON ST., NEW YORK.

GRANULATED EFFERVESCENT SALTS

PREPARED BY

WILLIAM R. WARNER & Co.,

CHEMISTS,

PHILADELPHIA.

Granulated Effervescent

VICHY SALT.

(Grand Grille.)

A large teaspoonful dissolved in half a glass of water, forms a grateful and refreshing draught, identical with the natural water. Per dozen, $4.00

Granulated Effervescent

SELTZER SALT.

A tablespoonful to half a glass of water forms a grateful and refreshing saline draught, identical with the natural water. Per Dozen, $4.00

Granulated Effervescent

SEIDLITZ MIXTURE.

(Seidlitz Powder, U. S. P.)

An excellent aperient and refrigerant, very acceptable to the stomach. Per doz. $4.00

DOSE.—One tablespoonful in a glass of water.

Granulated Effervescent

NITRATE of POTASSIUM.

A dessert-spoonful in glass of water makes an excellent mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

CITRATE OF POTASSIUM.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $5.00

Granulated Effervescent

Bi-Carbonate of Potassium.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

Pepsin, Bismuth and Strychnia.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin, soluble Citrate of Bismuth, and the sixtieth grain of Citrate of Strychnia. Per dozen, $10.00

Granulated Effervescent

PEPSIN AND BISMUTH.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin and soluble Citrate of Bismuth. Per doz. $9.00

Granulated Effervescent

CITRATE OF MAGNESIA.

(Pleasant and Efficient.)

For a purgative effect, take two or more tablespoonfuls added to a small glass of water, and drink while effervescing. As a laxative, one or more tablespoonfuls taken in the same manner. One or two teaspoonfuls in sweetened water, produces a delightful, cooling drink in summer. Per dozen, $4.00

Granulated Effervescent

CITRATE LITHIA.

Each drachm or teaspoonful contains four grains of the chemically pure salt. Valuable in Rheumatic, Gouty and Analogous disorders. Per dozen, $10.00

Granulated Effervescent

KISSINGEN SALT.

A large teaspoonful dissolved in half a glass of water, forms an agreeable and refreshing draught identical with the natural water. Per dozen, $4.00

Granulated Effervescent

CRAB ORCHARD SALT.

Prepared from the exact analysis of the purified natural salt, obtained from the Crab Orchard Spring, Ky.

A tablespoonful in half a glass of water forms a grateful effervescing draught, producing the effect of the natural water. Per dozen, $4.00

Granulated Effervescent

OXALATE OF CERIUM.

Each drachm or large teaspoonful contains two grains of Oxalate of Cerium. Per dozen, $5.00

Granulated Effervescent

CITRATE CAFFEINE.

A dessert-spoonful containing one grain of Citrate of Caffeine should be given for sick headache, every hour or two before and during the paroxysms. Per dozen, $10.00

Physicians will please specify Warner & Co.—Equal to best English.

In corresponding with Advertisers please mention THE MEDICAL AND SURGICAL REPORTER.

FLUID EXTRACT COCA.

NERVINE, STIMULANT.

USED IN PERU AND BOLIVIA AS A MASTICATORY.

This Extract contains the entire properties of the leaf of the **Erythroxylon Coca.**

COCA WINE.

This wine has been successfully used in France as a **Tonic,** and found very desirable where a more mild effect of the Coca than the Fluid Extract was desired.

FLUID EXTRACT OF FUCUS VESICULOSUS

(BLADDER WRACK).

SUCCESSFULLY USED FOR THE REDUCTION OF OBESITY.

It seems to have no appreciable effect on the general health other than the removal of the adipose tissue.

The above Extracts have been prepared by us, and special care given that their medical properties be not impaired.

FLUID EXTRACT OF VISCUM ALBUM,

THE NEW SUBSTITUTE FOR ERGOT.

PROF. LISTER'S ANTISEPTIC DRESSING,

PREPARED BY US.

We also have direct from Edinburgh Professor Lister's entire Antiseptic Dressing, consisting of Antiseptic Gauze, Mackintosh Cloth, Protection Silk, Carbolized Ligatures, and Spray Producers for Dr. Lister's Method.

CASWELL, HAZARD & CO.,

NEW YORK.

HUNYADI JANOS MINERAL WATER.

THE BEST AND CHEAPEST

NATURAL APERIENT.

THE BRITISH MEDICAL JOURNAL.

"HUNYADI JANOS.—The most agreeable, safest and most efficacious aperient water which has been brought under our notice."

LONDON MEDICAL RECORD.

"*Hunyadi Janos.*—The most pleasant and, owing to the smallness of its dose, the CHEAPEST of all the natural Aperient Waters."

THE LANCET.

"HUNYADI JANOS.—Baron Liebig affirms that its richness in aperient salts surpasses that of all other known waters."

From Prof. MACNAMARA, Prof. of Materia Medica, Royal College of Surgeons in Ireland.

"Far the most valuable and palatable of our Aperient Mineral Waters. I have been agreeably surprised with the result of a clinical investigation."

Specially approved by the Academy of Medicine of Paris, and its Sale in France authorized by decree of the French Government.

Medals awarded: Lyons, 1872. Vienna, 1873. Paris, 1878.

USES OF HUNYADI JANOS	ACCORDING TO OPINIONS OF EMINENT AUTHORITIES.
1. For habitual constipation.	"None so prompt, mild, and can be so well borne for a length of time."—Prof. SPIEGELBERG, *University of Breslau.*
2. By persons inclined to obesity, congestive and gouty disorders.	"I have used the Hunyadi Janos water in many cases of the rheumatic and gouty diathesis with very marked benefit. In cases accompanied with great obesity I prefer it to any other laxative."—Prof. LEWIS A. SAYRE, M.D., *Bellevue Hospital, New York.* "Preferred to Friedrichshall and Pullna by those who have tried them."—Prof. AITKEN, F.R.S., *Netley.* "Of great use in catarrhal conditions of the pile-ducts and bowels, and for CONGESTION of the LIVER and OTHER ORGANS."—*Medical Times and Gazette.*
3. In chronic affections of the organs of respiration and Circulation.	"Produces remarkable relief in chronic diseases symptomatic of affections of the abdominal and thoracic organs, and in serous effusions with impediment of respiration and circulation."—Prof. ALOIS MARTIN, *Royal Medical Councillor, University of Munich.*
4. Against hæmorrhoids, and portal and hepatic congestion.	"The most certain and the most comfortable in its action of all the aperient waters. The special indications for its use are, in costiveness (especially in that of pregnancy), in portal congestion with tendency to hæmorrhoids, and in sluggish action of the liver."—Inspector-General MACPHERSON, M.D., *Author of "Baths and Wells of Europe."*
5. During pregnancy; for nursery use; and in many female disorders.	"I prescribe none but this."—Baron v. SCANZONI, *Wurzburg.* "I prefer this to any and every other."—Dr. MARION SIMS, *New York, Honorary Fellow Obstetrical Society of London and Dublin.*
6. In bilious attacks and sick headaches.	"I have made use of the Hunyadi Janos mineral water ever since its introduction into this country, and with ever increasing satisfaction. It is highly beneficial to persons of sedentary habit, and in what are called bilious attacks."—Dr. SILVER, *Lecturer on Clinical Medicine, Charing-Cross Hospital.*
7. Against evil consequences of indiscretion in Diet.	"Has invariably good and prompt success: a most valuable item in the balneological treasury."—Prof. VIRCHOW, *Berlin.*

For ordinary aperient purposes a half wineglassful of the Hunyadi Water may be taken at bed-time, or a wineglassful taken in the morning fasting It is most efficacious when warmed to a temperature not below 60 deg., or when an equal quantity of hot water is added to it.

HUNYADI JANOS MINERAL WATER.

INDISPENSABLE TO THE TRAVELLING PUBLIC.

To secure the genuine Water, require bottles with a blue label bearing the name

The APOLLINARIS COMPANY, Limited, 19 Regent St., London, England.

Sole Agents for the United States, **FREDK. DE BARY & CO.,** 41 and 43 Warren St., New York.

DUREL'S
TAR AND IRON SYRUP AND CAPSULES.
PREPARED BY DUREL, PHARMACIST, PARIS.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron is a desideratum which has at last been attained in these preparations. The indications for such a remedy are many, but it has been found especially useful in CHLOROSIS, BRONCHIAL CATARRH, CATARRH OF THE BLADDER, CHRONIC UTERINE DISCHARGES, depending upon an enfeebled or relaxed state of the system.

Sold by Chemists generally.

CRINON'S HÆMOGLOBIN,
The Albuminoid Ferruginous Principle of Blood.

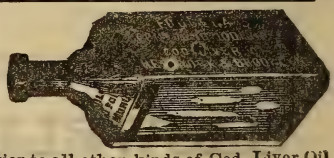
HÆMOGLOBIN is the only physiological chalybeate. Associated as it is with the phosphates of the blood, it forms the most powerful of tonics, and at the same time a most nourishing food. It is especially useful in cases of *Anæmia, Chlorosis, Cachexias, Exhaustion* caused by excess of work, nervous debility, fatigue resulting from parturition and lactation. It replaces entirely liquid blood, which has been recommended and used with success in *Phthisis* and *wasting away.*

It is offered in two forms: In cachets (wafers), 60 of which are contained in a box; combined with chocolate in small squares, 30 of which are in a box; both forms can be sent by mail.

Prepared by C. CRINON, Paris, Pharmacist of the first class, Laureate of the Hospitals of Paris. Samples may be obtained by application to

E. FOUGERA & CO., New York, Agents for the U. S.

FOUGERA'S COMPOUND IODINISED
COD LIVER OIL.



Since the introduction of this oil in 1858, it has been found to be superior to all other kinds of Cod Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod Liver Oil, but also the **tonic, stimulant** and **alterative** properties of **Iodine, Bromine** and **Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod Liver Oil.

Through its **increased curative action, FOUGERA'S COD LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod Liver Oil would fail entirely.

FOUGERA'S READY-MADE MUSTARD PLASTERS.

A most useful, convenient, clean, and economical preparation. Not liable to change if kept in a dry place. Made of two strengths. Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll, of 10 plasters each. DIRECTIONS.—Dip the Plaster, or Plasters, a minute or two, in cold water; apply on the part, and cover with a band.

FOUGERA'S COMPOUND ICELAND MOSS PASTE.
(Iceland Moss, Lactucarium, Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, etc.

Wakefulness, Cough, and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this Paste.

FOUGERA'S IODO-FERRO-PHOSPHATED ELIXIR OF HORSE-RADISH.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of antiscorbutic and aromatic plants, and acts as a **tonic, stimulant, emmenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

E. FOUGERA, Pharmacist,
372 Seventh Street, Brooklyn, L. I.,
SOLE PROPRIETOR & MANUFACTURER OF THE ABOVE,
To whom all special communications should be addressed.

E. FOUGERA & CO.,
30 North William Street, New York.
SOLE GENERAL AGENTS for the ABOVE,
To whom all orders should be addressed.

SOLD BY DRUGGISTS GENERALLY.

In corresponding with Advertisers please mention THE MEDICAL AND SURGICAL REPORTER.

VACCINE VIRUS.

In order to meet properly the continued demand upon us for ANIMAL VIRUS, we have established stables for its propagation upon carefully selected heifers. The lymph used is of the well-known "Beaugency" stock, imported by ourselves expressly for this purpose. The result of several years' experience in supplying this lymph leads us to believe that its excellence is unsurpassed. The establishment is under the care of a competent physician, who will spare no pains to produce a perfectly RELIABLE and PURE article, which we are prepared to furnish FRESH, DAILY.

We can also furnish, to those who prefer it, HUMANIZED VIRUS, from healthy children, procured for us by physicians of undoubted reliability.

All our Virus is put up in strong, *air-tight, sealed packages*, for safe conveyance by mail or express, and will be sent (post-paid if by mail) upon the following terms:—

From the Heifer, 10 large Ivory Points, well charged on both sides	$1.50
5 large Ivory Points, " " "	.80
Large Ivory Points, less than 5, " " " each	.25
1 Crust, new method, in air-tight Glass Capsule	2.00
From Healthy Infants, 10 small Ivory Points	1.50
1 Crust from Unruptured Vesicles	2.00

Directions for vaccinating with either form of Virus, derived from methods successfully employed, will be furnished with Virus if requested.

We will warrant every package of Points and every Crust, giving a fresh supply in case of failure reported within fifteen days for Points, thirty days for Human, and ninety days for Kine Crusts. We can usually furnish Crusts one remove from the heifer, if preferred.

On account of their unreliability, we have hitherto furnished the usual form of Kine Crust unwillingly. Under our new method of taking and preserving them, however, after careful tests and an experience extending over several months, the results attained have been so satisfactory that we now offer them as not less active and reliable than other forms of Virus, while less liable to become inert with lapse of time. We now offer them on very favorable terms, and recommend them for transmission to a distance, and in all cases where it is desired to preserve Virus for some weeks or months, or to keep a supply at hand for emergencies.

We also furnish UNCHARGED IVORY POINTS, for physicians' use, at the following rates:—

Small	per 100, 25 cents; per 1000	2.00
Large	per 100, 50 cents; per 1000	4.00

Orders by mail or telegraph answered by return train.

Liberal discounts upon large supplies for Cities, Towns, and Institutions.

SCARIFYING VACCINATOR, STEEL, NICKEL PLATED. See Cut. Each 25 cents.

New Illustrated Catalogue of Surgical Instruments sent, post-paid, on request.

TO THE MEDICAL PROFESSION.

MALTINE.

(Extract of Malted Barley, Wheat & Oats.)

THIS PREPARATION

Contains from three to five times the Medicinal and Nutritive elements found in Extract of Malt.

MALTINE is a highly concentrated extract of malted *Barley, Wheat,* and *Oats,* containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST.—In the manufacture of **MALTINE** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates, and Albuminoids, on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity, possessing little virtue aside from the saccharine matter which it contains.*

SECOND.—*Carbon, Hydrogen, Nitrogen, Sulphur, Iron, Magnesium,* and *Potassium,* are essential elements in the food of man, and it is only in **MALTINE,** containing the combined properties of malted *Barley, Wheat,* and *Oats,* that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD.—*Gluten* is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. **MALTINE** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH.—Liebig says, "Wheat and Oats stand first among our list of cereals in combining all the elements in proportions necessary to support animal life. They are especially rich in muscular and fat-producing elements." The only reason we use Malted Barley, in the manufacture of **MALTINE,** is that it contains larger proportions of mineral matters (bone producers) and Diastase. It is deficient in all other essential elements.

We believe that any practitioner will readily recognize the superiority of MALTINE, and would request a trial and comparison of merits with any article offered for similar uses.

* As a sure test for Diastase, and the Albuminoids, a small quantity should be put in a test tube or small vial, largely diluted with water, and heated to the boiling point, when the Albumen, if present, will coagulate, and appear in little flocculent particles throughout the liquid. If the extract remains clear, it is proof that it has already been coagulated by excessive heat, and removed by filtration during the process of manufacturing. Any heat which will coagulate Albumen will inevitably destroy the digestive power of Diastase.

In corresponding with Advertisers please mention THE MEDICAL AND SURGICAL REPORTER.

The Nitrogenous constituents of *MALTINE* have a composition identical with that of the chief constituents of the Blood, and therefore contain nearly every element requisite for the reproduction of the human body.

MALTINE AND ITS COMPOUNDS

can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULÆ AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS, AND ON THE LABEL ATTACHED TO EACH BOTTLE:

***MALTINE* WITH HOPS.**

***MALTINE*, FERRATED:**

This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

***MALTINE* WITH PHOSPHATES IRON AND QUINIA:**

A powerful general and nutritive tonic.

***MALTINE* WITH PHOSPHATES IRON, QUINIA AND STRYCHNIA:**

A powerful nutritive, general and nervous tonic.

***MALTINE* WITH PEPSIN AND PANCREATINE:**

One of the most effective combinations in Dyspepsia, Cholera Infantum, and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the *MALTINE*. We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

***MALTINE* WITH BEEF AND IRON:**

One of the most valuable combinations in cases of General Debility, when there is deficient nutrition and a deficiency of Iron in the system.

***MALTINE* WITH ALTERATIVES:**

In this preparation *MALTINE* is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.

MALTINE WINE.

This preparation contains all the medicinal and nutritive constituents of *MALTINE*, less 60 per cent. of the transformed starch or glucose, which renders the preparation lighter and more acceptable to some stomachs, and is recommended only in such cases.

***MALTINE WINE* WITH PEPSIN AND PANCREATINE:**

(Each fluid ounce of MALTINE WINE contains 15 grains pure PEPSIN and 15 grains pure PANCREATINE).

We can recommend this preparation to the Medical Profession as being the most important remedy ever brought to their notice in all cases of Dyspepsia and Imperfect Nutrition, when the system needs invigorating and replenishing. It will be found, we believe, a perfect remedy in Vomiting in Pregnancy, Cholera Infantum and wasting diseases of children, and in Constipation and Chronic Diarrhœa resulting from mal-nutrition. It will agree with the most irritable stomach.

MALTO-YERBINE.

(Each pint of the above preparation contains 13 ounces MALTINE, 2 ounces CARRAGEEN and 1 ounce YERBINE).

With the nutritive, emollient and demulcent properties of *MALTINE* and *CARRAGEEN*, and the expectorant qualities of *YERBINE* (active principle of Yerba Santa), we offer this preparation to the Profession with the fullest confidence that it is the most perfect remedy yet produced in Chronic Pulmonary Affections, Irritation of the Mucous Membrane, Difficult Expectoration, Bronchitis and ordinary Coughs and Colds.

The Dose of all Preparations of *MALTINE* and compounds is from a dessert to a tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only.*

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in half-pint, pint and five-pint amber bottles; each bottle inclosed in a folding paper box.

1137-1162-eow

TROMMER'S EXTRACT OF MALT.

The rapidly increasing demand for our IMPROVED EXTRACT OF MALT, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantities; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or moulding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expense of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops**, viz: MALT SUGAR, DEXTRINE, DIASTASE, RESIN and BITTER of HOPS, PHOSPHATES of LIME and MAGNESIA, and ALKALINE SALTS.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:—
Malt Sugar 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712. Alkalies .377; Water, 25.7; Total, 99.958.
In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article.

Yours truly, SILAS H. DOUGLAS,
Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt contains a larger quantity of the active properties of Malt than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ pounds of the Extract.

Our preparations of Malt are for sale by druggists generally, throughout the United States and Canada, at the following prices:—

EXTRACT OF MALT,	*With Hops (Plain)*,	- - - - - - -	$1.00

TROMMER EXTRACT OF MALT CO.,

FREMONT, OHIO.

1114eow

BARON LEIBIG, the greatest authority on Infant Diet, states that the majority of children who die under one year of age, do so from the effects of improper food, or from the improper administration of the food.

HORLICK'S FOOD.

A Concentrated Extract, prepared according to the Formula of Baron Liebig, and, unlike other Foods,

IS NOT FARINACEOUS.

It is acknowledged by Physicians to be the best Food

For Infants, Dyspeptics and Invalids.

Prof. J. Lewis Smith Says,

Speaking of **HORLICK'S FOOD:** "Being carefully prepared, according to Liebig's Formula, by Chemists fully competent, it possesses certain advantages, such as quick and easy preparation and a pleasant flavor, and is therefore highly esteemed by those who have used it." [*Page* 58 *of the fourth edition of a Treatise on Diseases of Infancy and Childhood. By J. Lewis Smith, M. D., etc.*—1879] Also, speaking in another place [page 647] of artificial food for infants, especially those suffering from intestinal catarrh, he says: "I prefer Liebig's, especially **HORLICK'S** preparation of it."

Report from Bellevue Hospital, New York.

In *The Hospital Gazette* for February 6th. 1879 [page 108] Dr. E. Hochheimer makes a report from BELLEVUE HOSPITAL of a case of Infantile Paralysis, which was followed by an exhausting diarrhœa—Speaking of the treatment, he says: "Her condition continued unchanged for the next three weeks; she was put upon a diet consisting principally of milk, but the diarrhœa persisted in spite of opiates and astringents."

"*Nov. 17th.—Milk was stopped, and she was put upon a diet of HORLICK'S FOOD; after this she began to mend, the diarrhœa became less and finally disappeared; she began to gain flesh, and her general condition was much improved.*"

We also beg to refer, by permission, to the following eminent medical men, who have used our Food extensively in their practice:—**Prof. DeLaskie Miller,** (Rush Medical College); **Prof. Wm. H. Byford,** (Chicago Medical College); **Prof. J. Adams Allen,** (Rush Medical College); **Drs. J. P. Oliver** and **C. P. Putnam,** (Harvard Medical School); **Prof. Gawne,** (Cleveland Medical College); and several hundred others whose testimonial letters are on file in our office.

PRICE, 75 Cents per bottle. Trial Size, 40 Cents.

BETHESDA WATER.

BELLEVUE, PA., May 21st, 1879.

W. B. HYATT, M.D.,

Marshallville, Wayne Co., Ohio.

DEAR SIR:—Your letter received this morning. Am sorry my friend Dr. S. did not think to tell you to address me at Pittsburg, and your communication would have reached me in a few hours instead of days, as I seldom call at the village P. O.

You will address your orders for BETHESDA WATER to JOSEPH FLEMING, 84 Market Street, Pittsburg, Pa., and they will receive prompt attention. I say this on account of my business acquaintance with Mr. Fleming. I will call on him in the morning, and have him send you pamphlets and any information relative to the matter he may think required.

If my testimony regarding the efficacy of Bethesda Water was required, I could cite several cases of my own personal knowledge. I am convinced that it is a specific in diseases arising from a morbid condition of the kidneys, providing, of course, that the disease has not reached a point beyond the possibility of recovery, as in the case of my late brother, and even then no figures could estimate its value in giving relief from suffering. I have a friend who was under treatment of different physicians all last fall and winter, and apparently getting worse: I persuaded him to stop the treatment and use the "water," and before he had used ten (10) gallons he was much better, and now nearly if not quite well. The doctors would diagnose Phlebitis, but there was a low specific gravity of the urine and other indications of kidney or dropsical affection, which satisfied me that he needed the effects of the "water;" and the results are as stated, and the inflamed vein is getting well, as well as general improved health. It occurs to me, the duty of physicians to investigate such things, and if they contain medicinal virtues, to make it known to suffering humanity instead of standing aloof until men in other walks of life have long recognized and demanded its use. Of course, there are so many new remedies claimed that are worthless, that there is some excuse, yet this Bethesda Water has been in use more than ten (10) years, and comparatively few physicians appear to know anything about its properties. Although you are a stranger to me, allow me to commend you, or any worthy physician who is willing to investigate and test its claimed virtues, and if found, to disseminate the knowledge among their less fortunate fellows. Yours, truly,

W. J. THOMPSON.

P. S.—If you have occasion to address me further, send your letter to Auditor's Office, P. A. R. R., Pittsburg, Pa.

Sunnyside Medical Retreat

For Mental and Nervous Diseases, Inebriety and the Opium Habit,

FORT WASHINGTON, NEW YORK CITY.

This home, situated on the banks of the Hudson, under the management of Dr. Edward C. Mann, late Medical Superintendent of the New York State Emigrant Insane Asylum, receives cases of either sex affected with mental disorders, Inebriety or the Opium habit. The beauty of location and surroundings, handsomely furnished apartments, and the attentions and comforts of home life, all combine to make Sunnyside an attractive and popular private retreat. Applications may be made to Dr. Mann, either by mail or personally, at Fort Washington. Twelve trains daily from Hudson River Depot, 30th St., and 10th Ave. Broadway and 23d St. line of stages run direct to depot. The profession respectfully invited to call, and cordially welcomed. 1152-1y

WOMAN'S HOSPITAL MEDICAL COLLEGE

337 and 339 S. Lincoln St., Chicago.

The *Tenth Annual Course of Lectures* will commence the first Tuesday in October, 1879, and continue twenty-one weeks. The Spring Term will commence April 1st, and continue twelve weeks. College building new. Clinical and Dissecting advantages unsurpassed.

FACULTY.—William H. Byford, A.M., M.D., President, Obstetrics; T. D. Fitch, M.D., Secretary, Gynecology; Charles W. Earle, M.D., Treasurer, Diseases of Children; I. N. Danforth, M.D., Pathology; J. E. Owens, M.D., Surgery; Henry M. Lyman, A.M., M.D., Practice of Medicine; D. R. Brower, M.D., Therapeutics and Nervous Diseases; Sarah H. Stevenson, M.D., Corresponding Secretary, Physiology; D. W. Graham, A.M., M.D., Anatomy; Plymouth S. Hayes, M.D., Chemistry.

For information or announcement, address either of the Secretaries, at 125 State Street.

DR. McINTOSH'S

Natural

UTERINE SUPPORTER.

No instrument has ever been placed before the medical profession which has given such universal satisfaction. The combination is such that the Physician is able to meet every indication of Uterine Displacements. Falling Womb, Anteversion, Retroversion and Flexions are overcome by this instrument, where others fail; this is proven by the fact that since its introduction to the Profession it has come into more general use than all other instruments combined.

Among the many reasons which recommend this Supporter to the Physician is its self-adjusting qualities. The Physician after applying it need have no fear that he will be called in haste to remove or readjust it, as is often the case with rings and various pessaries held in position by pressure against the vaginal wall, as the patient can remove it at will and replace it without assistance.

The Abdominal Supporter is a broad morocco leather belt, with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen. The Uterine Support is a cup and stem made of highly polished hard rubber, very light and durable, shaped to fit the neck of the womb, with openings for the secretions to pass out; as shown by the cuts. Cups are made with extended lips, to correct flexions and versions of the womb.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, passing down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic adapt themselves to all the varying positions of the body, and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Anteversion, Retroversions, or any Flexions of the Womb, and is used by the leading Physicians with never failing success, even in the most difficult cases.

Price—to Physicians, $8.00; to Patients, $12.00

Instruments sent by mail, at our risk, on receipt of price with 16 cents added for postage, or by Express, C. O. D.

192 JACKSON STREET, CHICAGO, ILL.

Our valuable pamphlet "Some Practical Facts about Displacements of the Womb," will be sent you free on application.

MIAMI MEDICAL COLLEGE OF CINCINNATI.

Member of the American Medical College Association.

FACULTY.

JOHN A. MURPHY, M.D., Professor of Principles and Practice of Medicine and Clinical Medicine.
WM. H. MUSSEY, M.D., Professor of Operative and Clinical Surgery and Surgical Diseases of Women.
E. WILLIAMS, M.D., Professor of Ophthalmology, Aural Surgery and Clinical Ophthalmology.
WM. CLENDENIN, M.D., Professor of Descriptive and Surgical Anatomy.
WM. H. TAYLOR, M.D., Professor of Obstetrics and Clinical Midwifery.
THOMAS H. KEARNEY, M.D., Professor of Principles of Surgery, Surgical Diseases and Clinical Surgery.
J. C. MACKENZIE, M.D., Professor of Physiology and Pathology and Clinical Medicine.
J. F. JUDGE, M.D., Lecturer on Chemistry and Toxicology.
WM. B. DAVIS, M.D., Professor of Materia Medica and Therapeutics.
BYRON STANTON, M.D., Professor of Diseases of Women and Children and Clinical Gnyæcology.
WM. H. DE WITT, M.D., Lecturer on Mental Diseases.
B. P. GOODE, M.D., Lecturer on Diseases of Children.
ROBT. SATTLER, M.D., Lecturer on Diseases of the Eye and Ear.
A. D. BENDER, M.D., Lecturer on Laryngoscopy and Diseases of the Throat, and Demonstrator of Anatomy.
C. A. LE BOUTILLIER, M.D., Lecturer on Surgical Dressings.
CHAS. W. MATHERS, M.D., Demonstrator of Anatomy.
WM. L. DUDLEY, Demonstrator of Chemistry.

THE PRELIMINARY TERM of Lectures will begin September 3d, 1879, and continue one month. This Course will be one of *unusual interest and importance* to physicians as well as students.

THE REGULAR WINTER SESSION will begin October 1st, 1879, and continue five months. This course will consist of Didactic Lectures with Demonstrations, Recitations, Clinical and Special Instruction, involving Physical Manipulations. From five to six Didactic Lectures and Demonstrations are delivered daily, covering the general topics of Medicine and Surgery as taught in all regular medical colleges.

CLINICS.—The Faculty confidently announce that students have, in this college, unsurpassed clinical advantages. *Four Special Clinics* are held daily, in the college building (at which more than six thousand patients are examined annually), viz.: In Practice, Surgery, Gynæcology, Diseases of Children, Ophthalmology and Larnygology, in all of which advanced students have opportunities to make full examinations, especially in *Thoracic Diseases* and *Gynæcology*, and frequently to witness *Obstetric* cases. These clinics are free to students of the college. Two clinical lectures are delivered daily at the Cincinnati Hospital (near the college), during the entire college session.

The College also affords the fullest advantages in *Practical Chemistry*, *Practical Anatomy*, *Practical Physiology* and *Microscopy*.

FEES.

Matriculation fee (annually)	$ 5 00	Demonstrator's Ticket	$5 00
Regular Lecture Term	75 00	Hospital Ticket	5 00
Graduation Fee	25 00	Alumni of this institution free.

DR. L. D. McINTOSH'S
Electric or Galvanic Belt.

If this new combination could be seen and tested by the medical profession, few, if any, words would be needed from us in its favor, for it combines utility with simplicity in such perfection that seeing it is convincing proof of its great value. The medical profession to-day acknowledge, almost universally, Electro-Therapeutics.

This combination is composed of sixteen cells, placed in pockets on a belt. Each cell is made of hard vulcanized rubber, lined with a copper cell, which constitutes the negative plate. The rubber coating perfectly insulates each cell. The positive plates are of zinc, wrapped in a porous material, to absorb the exciting fluid and prevent contact with the copper, and permit the current to pass from the copper to the zinc.

Thus the cells are charged without wetting the belt, and the discomfort following to the patient. A wire is soldered to each zinc plate, which connects with the copper cell by entering a tube on its side, thus rendering the belt pliable.

The McIntosh Electric Belt is superior to all others for the following reasons:—

It is composed of sixteen cells—thus giving a powerful current. A current selector is so arranged that one or more cells can be used at pleasure. There is not anything irritating about the Belt, as is the case with all other contrivances where the metal used is wet with weak acids and placed next to the skin. The electrodes are pieces of metal covered similar to ordinary battery electrodes, and connected with the cells by connecting cords. By this arrangement, a current from the Belt can be applied, to produce a general or local effect.

Physicians who have used this belt in their practice do not hesitate to recommend it to the profession.

Our pamphlet on Medical Electricity sent free on application. Address

GEORGE P. ANDREWS, M.D.,
Professor of Principles and Practice of Medicine and Clinical Medicine.

C. B. GILBERT, M.D.,
Professor of Obstetrics, and Diseases of Women and Children.

N. W. WEBBER, M.D.,
Professor of General and Descriptive Anatomy, and Clinical Surgery.

SAMUEL P. DUFFIELD, PH.D., M.D.,
Professor of Toxicology and Medical Jurisprudence.

ALBERT B. LYONS, M.D.,
Professor of Chemistry and Director of the Chemical Laboratory.

LEARTUS CONNOR, M.D., Secretary,
Professor of Physiology and Diseases of the Eye and Ear.

H. O. WALKER, M.D.,
Lecturer on Anatomy and Genito-Urinary Diseases.

E. L. SHURLY, M.D.,
Lecturer on Materia Medica, Therapeutics and Clinical Laryngology.

HAL. C. WYMAN, M.D.,
Lecturer on Physiology.

J. G. JOHNSON, M.D.,
Lecturer on Diseases of Mind and Nervous System.

J. H. CARSTENS, M.D.,
Lecturer on Clinical Medicine.

F. A. SPALDING, M.D.,
Lecturer on Diseases of the Skin.

C. C. YEMANS, M.D.,
Lecturer on Chemistry.

E. A. CHAPOTON, M.D.,
Demonstrator of Practical Physiology and Instructor in Anatomy and Surgery.

J. W. ROBERTSON, M.D.,
Demonstrator of Practical Microscopy.

DAVID INGLIS, M.D.,
Instructor in Chemistry and Physiology.

E. B. WARD, M.D.,
Curator of Museum and Librarian.

The Collegiate Year is divided into three sessions.

Preliminary Session opens Wednesday, September 3d, 1879, and closes September 30th. The Clinics are held and the Lectures delivered by the Professors of the regular Faculty, and in the same order and frequency as during the Winter Term. Opportunity is given to dissect or work in the Chemical and Physiological Laboratories.

The Regular Session opens Wednesday, October 1st, 1879, and closes March 2d, 1880. During this term all the branches of *General Medicine* and *Surgery*, both scientific and practical, are taught with care and thoroughness. All students are daily examined on the subjects of the lectures and on their dissecting and laboratory work.

Senior students have *daily practice* in the *art of examining patients*, in forming their own diagnosis, prognosis and treatment. As this is done under the direction of the professor holding each clinic, and in the presence of the class, it constitutes an invaluable course of training.

The Recitation Session begins March 10th, 1880, and closes June 23d, 1880. Daily during this term will be held recitations for both Seniors and Juniors, and one or two clinics and a lecture.

The recitations will embrace a thorough drill upon the general subjects of the Regular Session, viz.: Anatomy, Chemistry, Physiology, Practice of Medicine, Materia Medica and Therapeutics, Surgery, Obstetrics, Diseases of Women and Children.

Though the Recitation and Preliminary Sessions are optional, it is hoped that all who can will avail themselves of their manifest advantages in commencing the study of medicine, or in supplementing the regular winter course.

Three Hospitals—Harper's, St. Mary's and St. Luke's—with two large free dispensaries, afford an abundance of clinical material for illustrative and practical teaching.

All lectures are delivered on Hospital grounds. The *peculiar feature* of this school is the *intimate union* between its *laboratory, clinical* and *didactic* instruction.

Fees.—For Preliminary and Regular Sessions: Matriculation, $5. Hospital Fees, $10. Lecture Fees, $40. Graduation, $25. Lecture Fees to third course students, $25.

For the Recitation Term the Lecture Fees are $10, to those who attend the other courses. All others are required to matriculate and take out the Hospital tickets.

All fees payable in advance to the *Secretary*.

Announcement and Catalogue, or any further information which may be desired, can be promptly obtained by addressing

LEARTUS CONNOR, M.D., Secretary,
92 Cass Street, Detroit.

SPECIAL FACTS CONCERNING

BELLADONNA PLASTER

IN RUBBER COMBINATION.

PREPARED BY

SEABURY & JOHNSON.

In undertaking the manufacture of Medicinal Plasters we had but one object in view—THE IMPROVEMENT OF ALL KINDS OF PLASTERS. Among the various plasters manufactured by us was BELLADONNA PLASTER. This article met with a larger demand than some of the others, acquired a reputation among the best druggists, and received the confidence of the profession. Its large sale interfered with rival manufacturers, and continuous efforts have been made on their part to prejudice physicians against it.

As these attacks have been of late more malicious than usual, we have deemed it advisable, in self-defence, and in order to place our article fairly before the practitioner, to assign reasons why we consider it the most thoroughly reliable preparation ever offered the medical profession. First, it is a combination of the Alcoholic Extract of Belladonna only, with purified rubber, and thus possesses all of the advantages of the rubber base, being pliable, convenient of application, and not subject to the deteriorating influence of age, as is the case when any other base is used. Secondly, it is freed from all irritative properties. Thirdly, it is more adhesive than any other plasters. Fourthly, we believe it to be as perfect, in every respect, as it is possible to make a Belladonna plaster.

ENGLISH EXTRACTS—WHY WE DO NOT EMPLOY THEM.

Imported English Extracts are prepared from the Inspissated Juice of the leaf, while our pharmacopœia formula is treated by Alcohol. The active principle of Belladonna (Atropia) is only partially obtained by Inspissation. The employment of Alcoholic or Hydro-Alcoholic Solvents completely exhausts the entire strength of the drug.

The value of both preparations is clearly presented in an able treatise published in the *American Journal of Pharmacy*, April 1876, page 145. Our own investigations are substantially identical :—

TABLE OF RESULTS,

	Test solution requisite for 100 cc. of Ext. Solution.	Percentage of Atropia in Extract.
EXT. BELLADONNÆ ALCOH. U. S. P.	*17·732*	*2·571*
GEO. ALLEN & CO., English	*9·73*	*1·411*
*HERRINGS & CO., " *	*8·133*	*1·179*
E. MERCK, Germany (aqueous extract), made 1869	*1·9*	*·275*

This analysis clearly establishes the fact that the **Alcoholic Extract of Belladonna of the U. S. P. averages over twice the strength of English Extracts,** and should, therefore, be preferred in all cases where a reliable article is desired. Inspissated and Aqueous Extracts deteriorate, while Alcoholic remain stable.

Therefore the assumption of pretentious manufacturers, that the English Extracts are the superior preparations, must be based on a former supposition rather than present facts. The following analysis substantiates our claim regarding English Extracts.

ANALYSIS OF BELLADONNA PLASTERS, BY PROF. R. OGDEN DOREMUS.

"BELLEVUE HOSPITAL COLLEGE, New York, Sept. 7, 1878.

"GENTLEMEN—I obtained from Messrs. W. H. Schieffelin & Co., of this city, samples of Belladonna Plasters prepared by Grosvenor & Richards, Boston ; Mitchell Novelty Plaster Works ; Seabury & Johnson, New York and London. I have examined these varieties for the purpose of determining which possesses the largest quantity of Atropine. I employed equal surfaces of each, and *my analysis demonstrated that* SEABURY & JOHNSON'S *contains the greatest proportion* of the active principle of Belladonna. "R. OGDEN DOREMUS, M.D., L.L.D."

Belladonna Plaster, prepared by Seabury & Johnson, is packed in elegant tin cases, which contain 1 yard each, and can be obtained of almost any druggist throughout the United States and Canada, or will be furnished direct by mail. Samples sent on application.

LESSONS IN GYNECOLOGY.

BY WM. GOODELL, A.M., M.D.,

Professor of Clinical Gynecology in the University of Pennsylvania.

With Numerous Illustrations

1 Vol., 8vo. Price, Cloth, $3.00.

This entirely new and complete work by this distinguished author cannot fail to prove a valuable addition to gynecological literature. The following table of contents will indicate its scope:—

Lesson	I.	Gynecological Instruments.
"	II.	Caruncle, and other Affections of the Female Urethra.
"	III.	Vesical Diseases of Women.
"	IV.	Fistulæ of the Female Genital Organs.
"	V.	Closure of the Vulva for Incurable Vesico-vaginal Fistulæ—Tumors of the Vulva.
"	VI.	On the Causes, Prevention, and the Cure of Lacerations of the Female Perineum; the Primary Operation.
"	VII.	Secondary Operation for Laceration of the Female Perineum.
"	VIII.	Local and Constitutional Treatment for Chronic Metritis and Endometritis.
"	IX.	Retroversions and Retroflexions of the Womb.
"	X.	Anteversions and Anteflexions of the Womb.
"	XI.	Dilatation of Cervical Canal; Rapid Dilatation; Tents.
"	XII.	On the Use of the Closed Lever Pessary, and of the Intra-uterine Stem Pessary.
"	XIII.	Different Kinds of Pessaries; Abdominal Supporters.
"	XIV.	Prolapse of the Womb; Prolapse from Simple Descent; Prolapse from Hypertrophic Elongation of the Infra-vaginal portion of Cervix.
"	XV.	Prolapse of the Womb from Hypertrophic Elongation of the Supra-vaginal Portion of the Cervix.
"	XVI.	Laceration of the Cervix Uteri.
"	XVII.	Cancer of the Womb.
"	XVIII.	Vegetations of the Endometrium.
"	XIX.	Polypus of the Womb.
"	XX.	Fibroid Tumors of the Womb.
"	XXI.	Treatment of Fibroid Tumors of the Womb.
"	XXII.	Spaying for Fibroid Tumors, and for other Diseases of the Womb.
"	XXIII.	Ovarian Cyst; its Diagnosis, and its Treatment by Tapping, by injections of Iodine, and by Drainage.
"	XXIV.	Ovariotomy by Abdominal Section.
"	XXV.	Vaginal Ovariotomy.
"	XXVI.	Nerve-tire and Womb-ills, or the Relation which the Nerves bear to the Diseases of Women.
"	XXVII.	The Prevention of Uterine Disorders.
"	XXVIII.	The Sexual Relations as Causes of Uterine Disorders.

These subjects are presented in a novel and attractive literary form, from the riches of an uncommonly wide clinical experience. Dr GOODELL'S operative procedures are generally marked by strong originality and much ingenuity; while his therapeutical plans are the result of very carefully studied observation. As a lecturer and teacher he is well-known to all students of his specialty, and the present volume is the only one he has published on the subject, and therefore the only source from which to derive a knowledge of his methods.

UNIVERSITY of the STATE OF NEW YORK.

HINTS IN THE OBSTETRIC PROCEDURE.

BY

WILLIAM B. ATKINSON, A.M., M.D.,

Lecturer on Diseases of Children, at the Jefferson Medical College; Physician to the Department of Obstetrics and Diseases of Women, Howard Hospital, Philad'a.

SECOND EDITION. ENTIRELY RE-WRITTEN AND ENLARGED. 12MO, CLOTH. PRICE, $1.00.

—o—

The very gratifying reception given this handbook of the essentials of the obstetrical art has led the author to submit it to a careful revision, and increase its size by adding a number of new topics.

It may safely be characterized as the most convenient, compact, reliable and handy *vade mecum* on obstetrics in the language; as the following personal and editorial statements sufficiently attest.

OPINIONS OF PHYSICIANS AND THE PRESS.

"It is really a '*multum in parvo*,' and will, I am sure, be of great service to multitudes in the profession who have hitherto followed the routine of old traditions."—*Prof. Fordyce Barker.*

"It is as good for the old as for the young practitioner."—*Dr. J. Marion Sims.*

"It abounds in extremely valuable hints, and is calculated to do much good."—*Prof. Goodell.*

"Founded upon the personal experience of the author, it must prove of value to the very wide circle of the profession who will be led to purchase it by their acquaintance with the author and his reputation."—(Philadelphia) *Medical Times.*

For Sale by D. G. BRINTON,
115 SOUTH SEVENTH STREET, PHILA.

HORSFORD'S
Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges.

[Unguentum Petrolei]

SAMPLES FURNISHED ON APPLICATION.

THE POST-OFFICE LAWS

Forbid anything of an oleaginous nature being sent through the mail.

THEOPHILUS REDWOOD, Ph.D., F. C. S., Professor of Chemistry and Pharmacy to the Pharmaceutical Society of Great Britain, says, in reference to this preparation:—

"UNGUENTUM PETROLEI appears to be obtained from crude Petroleum by fractional distillation and subsequent purification. Products of a similar description have been introduced in pharmacy, and recommended as substitutes for animal or vegetable fats in the preparation of ointments or liniments.

"Among these the UNGUENTUM PETROLEI is distinguished by its having a firmer consistence and a higher melting point, and in these respects it resembles pure lard, from which it differs in that it is entirely free from liability to become rancid or to undergo any chemical change. It has an amber color, and a smooth, jelly-like appearance and is almost wholly free from odor or taste. It is free from, and insoluble in, water. It is very slightly soluble in rectified spirit, but very soluble in ether, in fixed oils and fats. I am of opinion that its characters and properties are such as to render it a valuable adjunct to our Materia Medica."

Dr. TILBURY FOX, London, writes:—"I like the UNGUENTUM PETROLEI very much indeed, and shall not fail to prescribe it."

From "THE LANCET," London, October 20th, 1878.—"Semi-transparent, pale yellow in color, and perfectly free from offensive smell. We consider it a valuable preparation, and hope its use will become as common in England as it is said to be in America."

From "THE MEDICAL TIMES AND GAZETTE," London, October 20th, 1878.—"The substance introduced under the name of UNGUENTUM PETROLEI is of about the consistence of good lard, has no smell, keeps any length of time, apparently without becoming rancid, and may be exposed to any kind of atmosphere without undergoing chemical change. It has long been, we understand, in use in America, where it enjoys a wide-spread popularity; and it will, we doubt not, come into extensive use here also, as a vehicle for making ointments, as a demulcent in various diseases of the skin, and as a lubricant."

L. REICH,

DIRECT IMPORTER OF THE

CHOICEST AND PUREST

Hungarian WINES

EVER BROUGHT TO THIS COUNTRY,

STRICTLY FOR MEDICINAL USE.

13 West 11th St., New York.

Mr. REICH will be pleased to see those of the Medical Profession who may desire to avail themselves of the opportunity of procuring **STRICTLY FIRST-CLASS WINES**, which have received the endorsement of the most eminent Medical men of the country, as is evidenced from the following letters of commendation which have been received:—

This is to certify, that I have examined Mr. L. REICH'S TOKAYER AUSBRUCH, TOKAYER MASLAS and BUDAI IMP. I take great pleasure in commending these Wines to the Medical Profession because of their purity.

R. OGDEN DOREMUS, M.D., LL.D.,
Prof. of Chem. and Toxicology in Bellevue Hosp. Med. Col., and Prof. of Chem. and Physics in Col. City of New York.

We have used in our practice the Hungarian Wines sold by Mr. LORENZ REICH, who puts them on the market unadulterated, just as they are imported. To this fact we attribute their great value as a medicine in diseases where such tonics are indicated, especially in those which are attended by defective digestion and imperfect assimilation. We cordially recommend Mr. REICH and his Wines to our professional brethren.

1129-tfm **L. REICH, 13 West 11th St., bet. Broadway and University Place, New York.**

BE CAREFUL TO SPECIFY McKESSON & ROBBINS'.

IMPORTANT TO PHYSICIANS!

The fact that Sulphate of Quinine is only soluble in over 700 parts of water is not generally known, or if known is not usually considered, except in prescriptions, when this difficulty is overcome by the addition of Acid; and the further fact that **Bi-Sulphate of Quinine** is soluble in **only 10 parts of water** is as little appreciated.

McKesson & Robbins have paid much attention to the subject of putting Quinine into Pills, in a condition approaching that of a solution, and have at last succeeded in their **BI-SULPHATE OF QUININE PILLS,** and offer the same to the profession, confident that they will stand any test for solubility and prompt action. Physicians will please always specify **McK. & R. Bi-Sulph. Quinine Pills,** and they will not be disappointed in results.

Note.--With no reference to *respectable* druggists, we would say that cases have come to our knowledge and have been noted, where other pills have been substituted on prescriptions for ours.

POWDERED PURIFIED CHINOIDINE.

Containing all the Non-Crystalizable Alkaloids of Cinchona Bark.

Similar preparations have been lately offered in market AT HIGH PRICES under different fancy appellations, and claims made for the same as of equal efficiency with Quinine.

As a great demand exists for a cheap anti-malarial remedy, we introduce this preparation at low figures; and, in order that the profession may judge practically of its merits, will forward a sample to any physician's address, or mail one ounce upon receipt of FIFTY CENTS.

Yours respectfully,

McKESSON & ROBBINS,

Wholesale Druggists and Manufacturing Chemists,

91 FULTON ST., NEW YORK.

SPECIFY McKESSON & ROBBINS' Oval Sugar Coated Pills.

GRANULATED EFFERVESCENT SALTS

PREPARED BY

WILLIAM R. WARNER & Co.,

CHEMISTS,

PHILADELPHIA.

Granulated Effervescent

VICHY SALT.

(Grand Grille.)

A large teaspoonful dissolved in half a glass of water, forms a grateful and refreshing draught, identical with the natural water. Per dozen, $4.00

Granulated Effervescent

SELTZER SALT.

A tablespoonful to half a glass of water forms a grateful and refreshing saline draught, identical with the natural water. Per Dozen, $4.00

Granulated Effervescent

SEIDLITZ MIXTURE.

(Seidlitz Powder, U. S. P.)

An excellent aperient and refrigerant, very acceptable to the stomach. Per doz. $4.00

DOSE.—One tablespoonful in a glass of water.

Granulated Effervescent

NITRATE of POTASSIUM.

A dessert-spoonful in glass of water makes an excellent mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

CITRATE OF POTASSIUM.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $5.00

Granulated Effervescent

Bi-Carbonate of Potassium.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

Pepsin, Bismuth and Strychnia.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin, soluble Citrate of Bismuth, and the sixtieth grain of Citrate of Strychnia. Per dozen, $10.00

Granulated Effervescent

PEPSIN AND BISMUTH.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin and soluble Citrate of Bismuth. Per doz. $9.00

Granulated Effervescent

CITRATE OF MAGNESIA.

(Pleasant and Efficient.)

For a purgative effect, take two or more tablespoonfuls added to a small glass of water, and drink while effervescing. As a laxative, one or more tablespoonfuls taken in the same manner. One or two teaspoonfuls in sweetened water, produces a delightful, cooling drink in summer. Per dozen, $4.00

Granulated Effervescent

CITRATE LITHIA.

Each drachm or teaspoonful contains four grains of the chemically pure salt. Valuable in Rheumatic, Gouty and Analogous disorders. Per dozen, $10.00

Granulated Effervescent

KISSINGEN SALT.

A large teaspoonful dissolved in half a glass of water, forms an agreeable and refreshing draught identical with the natural water. Per dozen, $4.00

Granulated Effervescent

CRAB ORCHARD SALT.

Prepared from the exact analysis of the purified natural salt, obtained from the Crab Orchard Spring, Ky.

A tablespoonful in half a glass of water forms a grateful effervescing draught, producing the effect of the natural water. Per dozen, $4.00

Granulated Effervescent

OXALATE OF CERIUM.

Each drachm or large teaspoonful contains two grains of Oxalate of Cerium. Per dozen, $5.00

Granulated Effervescent

CITRATE CAFFEINE.

A dessert-spoonful containing one grain of Citrate of Caffeine should be given for sick headache, every hour or two before and during the paroxysms. Per dozen, $10.00

Physicians will please specify Warner & Co.—Equal to best English.

SOLUTION
FERROUS CHLORIDE.

This Solution of Iron is the lowest form of Chloride. It is much less styptic in taste than Tr. Iron Chloride, consequently pleasanter to the patient; it is much more easily assimilated by weak and irritable stomachs.

Knowing how difficult it is to introduce into the blood, in a proper form, a sufficient quantity of iron to be beneficial, we have manufactured and introduce the **Ferrous Chloride** as being easily absorbed and acting with much efficacy, even when given in small doses.

Dr. Rabuteau, who has specially studied the protochloride of iron, and shown that it is the most natural of ferruginous salts, thinks that he has found the very thing required:—

EXTRACT FROM THE REPORTS OF THE ACADEMY OF SCIENCES OF PARIS.
(*Sitting of* 11 *December*, 1871.)

" . . . . . The most important thing is the facility with which the protochloride of iron is absorbed by the stomach. Two or three hours after from 4 to 10 grains of this salt have been ingested, almost the whole is absorbed. Having finally observed that the reduced iron and the ferruginous oxyds and carbonates are changed into protochloride in the stomach by the contact with the hydrochloric acid of the gastric juice, I thought it necessary to substitute this salt for all the preceding for medicinal purposes. My observations in the wards of hospitals and in my own practice have convinced me of the successful results of the protochloride of iron, which is easily borne when pure and administered in a proper way."

For details, see the memoirs on the protochloride of iron published in the *Union Médicale, Paris,* 1871 and 1872.

Each fluid drachm contains two grains of the Anhydrous **Ferrous Chloride.**

CASWELL, HAZARD & CO., Druggists and Chemists,
New York.

HUNYADI JANOS MINERAL WATER.

THE BEST AND CHEAPEST
NATURAL APERIENT.

THE BRITISH MEDICAL JOURNAL.

"HUNYADI JANOS.—The most agreeable, safest and most efficacious aperient water which has been brought under our notice."

THE LANCET.

"HUNYADI JANOS.—Baron Liebig affirms that its richness in aperient salts surpasses that of all other known waters."

LONDON MEDICAL RECORD.

"*Hunyadi Janos.*—The most pleasant and, owing to the smallness of its dose, the CHEAPEST of all the natural Aperient Waters."

From Prof. MACNAMARA, Prof. of Materia Medica, Royal College of Surgeons in Ireland.

"Far the most valuable and palatable of our Aperient Mineral Waters. I have been agreeably surprised with the result of a clinical investigation."

Specially approved by the Academy of Medicine of Paris, and its Sale in France authorized by decree of the French Government.
Medals awarded: Lyons, 1872. Vienna, 1873. Paris, 1878.

USES OF HUNYADI JANOS	ACCORDING TO OPINIONS OF EMINENT AUTHORITIES.
1. For habitual constipation.	"None so prompt, mild, and can be so well borne for a length of time."—Prof. SPIEGELBERG, *University of Breslau.*
2. By persons inclined to obesity, congestive and gouty disorders.	"I have used the Hunyadi Janos water in many cases of the rheumatic and gouty diathesis with very marked benefit. In cases accompanied with great obesity I prefer it to any other laxative."—Prof. LEWIS A. SAYRE, M.D., *Bellevue Hospital, New York.* "Preferred to Friedrichshall and Pullna by those who have tried them."—Prof. AITKEN, F.R.S., *Netley.* "Of great use in catarrhal conditions of the pile-ducts and bowels, and for CONGESTION of the LIVER and OTHER ORGANS."—*Medical Times and Gazette.*
3. In chronic affections of the organs of respiration and Circulation.	"Produces remarkable relief in chronic diseases symptomatic of affections of the abdominal and thoracic organs, and in serous effusions with impediment of respiration and circulation."—Prof. ALOIS MARTIN, *Royal Medical Councillor, University of Munich.*
4. Against hæmorrhoids, and portal and hepatic congestion.	"The most certain and the most comfortable in its action of all the aperient waters. The special indications for its use are, in costiveness (especially in that of pregnancy), in portal congestion with tendency to hæmorrhoids, and in sluggish action of the liver."—Inspector-General MACPHERSON, M.D., *Author of "Baths and Wells of Europe."*
5. During pregnancy; for nursery use; and in many female disorders.	"I prescribe none but this."—Baron v. SCANZONI, *Wurzburg.* "I prefer this to any and every other."—Dr. MARION SIMS, *New York, Honorary Fellow Obstetrical Society of London and Dublin.*
6. In bilious attacks and sick headaches.	"I have made use of the Hunyadi Janos mineral water ever since its introduction into this country, and with ever increasing satisfaction. It is highly beneficial to persons of sedentary habit, and in what are called bilious attacks."—Dr. SILVER, *Lecturer on Clinical Medicine, Charing-Cross Hospital.*
7. Against evil consequences of indiscretion in Diet.	"Has invariably good and prompt success: a most valuable item in the balneological treasury."—Prof. VIRCHOW, *Berlin.*

For ordinary aperient purposes a half wineglassful of the Hunyadi Water may be taken at bed-time, or a wineglassful taken in the morning fasting. It is most efficacious when warmed to a temperature not below 60 deg., or when an equal quantity of hot water is added to it.

HUNYADI JANOS MINERAL WATER,
INDISPENSABLE TO THE TRAVELLING PUBLIC.

To secure the genuine Water, require bottles with a blue label bearing the name
The APOLLINARIS COMPANY, Limited, 19 Regent St., London, England.
Sole Agents for the United States, **FREDK. DE BARY & CO.**, 41 and 43 Warren St., New York.

TO SURGEONS AND GYNÆCOLOGISTS.

ABSORBENT COTTON.

We offer to *Physicians* and *Surgeons* a *prepared cotton*, which will prove a valuable adjunct in practice—a *cheap*, *clean*, and *ready* mode of making all kinds of local applications, and a *substitute for sponge;* a rapid and effective desiccant, having such an affinity for moisture that it instantly and greedily absorbs any secretion with which it may be brought into contact. *Surgeons* and *Gynæcologists* will at once appreciate the advantage possessed by this article over ordinary raw cotton, which is a repellent of moisture rather than absorbent.

It is *absolutely pure*, free from any reaction and from any foreign matter.

As a *padding for splints*, etc., it facilitates the normal secretions of the skin, while retaining all of the elasticity of the ordinary cotton.

"HANCE BROTHERS & WHITE'S ABSORBENT COTTON comes in for a good word now, because, for several months we have used it with remarkable success—substituting it in all cases for the well-known patent lint. As an absorbent of vitiated secretions and purulent discharges—whether excoriating or non-excoriating—it seems to surpass everything; and we are inclined to believe that it also possesses *antiseptic* properties, so perfectly does it protect the surrounding parts from infection. Our dentists and surgeons are using it. We have used it in dressing wounds and ulcers and burns. In ulcerations of the os and cervix uteri and in leucorrhœa; we have applied it to the os to protect the vagina; we have applied it to the glans-penis in gonorrhœa, and to hard and soft chancres, and have been delighted with its power to cleanse; the parts requiring no after-washing, only a new supply of cotton."—From *St. Louis Clinical Review*, January 15, 1879.

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION,

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil, by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM, instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat, in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more valuable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatized Cod-Liver Oil, the active digestive principle of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Pancreatine effects the digestion and assimilation of Cod-Liver Oil and Fat, as well as Food generally. This palatable and popular remedy is therefore invaluable to PATIENTS WHO ARE UNABLE TO DIGEST COD-LIVER OIL, and who are thus deprived of its nourishing and invigorating properties.

Pancreatine Wine. An excellent vehicle for taking Cod-Liver Oil and promoting the digestion of it.

Tins, 1*s*, 2*s*, 5*s*, 10*s*.

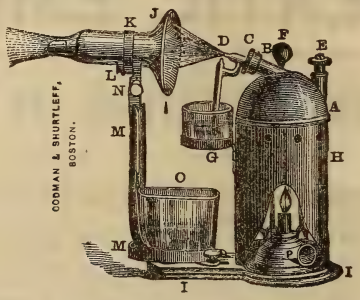
CODMAN & SHURTLEFF'S

ATOMIZING APPARATUS.

PRICES REDUCED.



THE COMPLETE STEAM ATOMIZER. (Patented March 24, 1868.)

All its joints are hard-soldered.

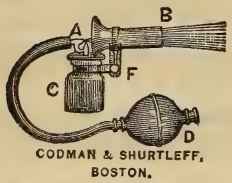
Every one is tested by hydrostatic pressure, to more than one hundred pounds to the square inch.

It cannot be injured by exhaustion of water, or any attainable pressure, and will last for many years.

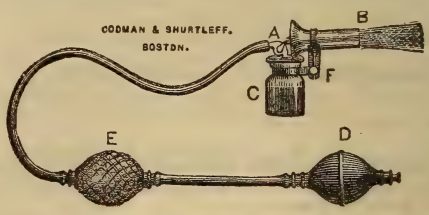
It does not throw spirts of hot water, is convenient, durable, portable, compact, and cheap, in the best sense of the word. Price $5.00. Postage 59c.

Brass parts, nickel-plated, additional, $2.00.

Neatly made, strong Black Walnut Box, with convenient Handle, additional, $2.50. Postage 44c.



THE BOSTON ATOMIZER. (Patented.)



SHURTLEFF'S ATOMIZING APPARATUS. (Patented.)

The most desirable Hand Apparatus. Rubber warranted of the very best quality. Valves imperishable, every one carefully fitted, and will work perfectly in all positions. Price $3.50.

The Bulbs are adapted to all the Atomizing Tubes made by us.

Each of the above Apparatus is supplied with two carefully-made annealed glass Atomizing Tubes, and accompanied with directions for use. Each Apparatus is carefully packed for transportation, and warranted perfect.

TO THE MEDICAL PROFESSION.

LACTOPEPTINE,

The most important remedial agent ever presented to the Profession for Indigestion, Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all diseases arising from Imperfect Nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase, or Veg. Ptyalin, Lactic and Hydrochloric Acids, in Combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk.....40 ounces.	Veg. Ptyalin or Diastase.....4 drachms.
Pepsin.....8 ounces.	Lactic Acid.....5 fl. drachms.
Pancreatine.....6 ounces.	Hydrochloric Acid.....5 fl. drachms.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its almost universal adoption by the Profession is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned having tested LACTOPEPTINE, recommend it to the Profession:—

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

LEWIS A. SAYRE, M.D.,
Professor of Orthopædic Surgery and Clinical Surgery, Bellevue Hospital Medical College.

F. LE ROY SATTERLEE, M.D., PH.D.,
Professor of Chem., Mat. Med. and Therap. in the N. Y. College of Dent.; Prof. of Chem. and Hygiene in the Am. Vet. College, etc., etc.

SAMUEL R. PERCY, M.D.,
Professor Materia Medica, New York Medical College.

A. VAN DEVEER, M.D.,
ALBANY, N. Y., June 8th, 1878.
Prof. of the Prin. and Prac. of Surg., Albany Med. Col.; Surg. Albany and St. Peter's Hospitals.
"I have given LACTOPEPTINE a good thorough trial, and have been greatly pleased with the excellent results that have followed its administration."

JOHN H. PACKARD, M.D.,
PHILADELPHIA, PA., May 30th, 1878.
Pres't Phila. Co. Obstet. Society; Surg. Episcopal and Women's Hospitals.
"I have found great satisfaction in the use of LACTOPEPTINE, and have ordered it frequently in cases of Dyspepsia, especially where there is want of tone and defective secretion."

JAS. AITKEN MEIGS, M.D.,
PHILADELPHIA, June 20th, 1878.
Prof. of the Institutes of Med. and Med. Juris., Jeff. Medical College; Phy. to Penn. Hos.
"I have used LACTOPEPTINE with very good effect in a number of cases of Dyspepsia."

W. W. DAWSON, M.D.,
CINCINNATI, O., June 21st, 1878.
Prof. Prin. and Prac. Surg., Med. Col. of Ohio; Surg. to Good Samaritan Hospital.
"I have used LACTOPEPTINE with great advantage in cases of feeble digestion."

ALBERT F. A. KING, M.D.,
WASHINGTON, D. C., June 19th, 1878.
Prof. of Obstetrics, University of Vermont.
"I have used LACTOPEPTINE both in hospital and private practice, and have found it to answer fully the purposes for which it is recommended. As an immediate aid to the digestive function, I know of no remedy which acts more directly."

D. W. YANDELL, M.D.,
LOUISVILLE, KY., March 7th, 1878.
Prof. of the Science and Art of Surg. and Clinical Surg., University of Louisville.
"I have made much use of LACTOPEPTINE, and take great pleasure in stating that it has rarely disappointed me. I shall, of course, continue to prescribe it."

ROBT. BATTEY, M.D.,
ROME, GA., June 8th, 1878.
Emeritus Prof. of Obstetrics, Atlanta Med. College, and Ex-Pres. Med. Association of Ga.
"I have used LACTOPEPTINE in a case of Dyspepsia with satisfaction. I think well of it."

CLAUDE H. MASTIN, M.D., LL.D.,
MOBILE, ALA., June 8th, 1878.
"I consider LACTOPEPTINE the very best preparation of the kind which I have ever employed, and for patients with feeble digestion I know of nothing that is equal to it."

Prof. H. C. BARTLETT, PH.D., F.C.S.,
LONDON, ENG., February 22d, 1876.
"I find the preparation of LACTOPEPTINE contains within itself all the principles required to promote a healthy digestion.

PRICE LIST.

LACTOPEPTINE (in oz. bottles).....per oz. $1.00
" (" ").....per doz. 10.00
" (in ½ lb ").....per lb. 12.00

We also prepare the various Elixirs and Syrups, in combination with Lactopeptine.

1140-1191eow

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt. and all its combinations.

Extract of Malt,

WITH COD-LIVER OIL,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO,

(See Transactions of American Medical Association, for 1876, page 176.)

Is presented to the medical profession as an efficient, palatable and very stable combination, consisting of equal parts of the ***Extract of Canadian Barley Malt*** and the best quality of genuine ***Norwegian Cod-liver Oil.*** Many patients take this preparation who cannot take the oil in any other form. It may be employed in all cases where Cod-liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

Extract of Malt,

WITH COD-LIVER OIL AND PHOSPHORUS,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod-liver Oil, Phosphorus being added in the proportion of $\frac{1}{100}$ grain to the dose, and so combined as to be perfectly protected from oxidation. The ***Trommer Extract of Malt Company*** prepare this combination agreeably to the suggestion of ***Dr. Wilson Fox.*** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

Extract of Malt,

WITH COD-LIVER OIL AND IODIDE OF IRON

added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod-liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians, referring to it in terms of high praise.

1090-1115eow

BARON LEIBIG, the greatest authority on Infant Diet, states that the majority of children who die under one year of age, do so from the effects of improper food, or from the improper administration of the food.

HORLICK'S FOOD.

A Concentrated Extract, prepared according to the Formula of Baron Liebig, and, unlike other Foods,

IS NOT FARINACEOUS.

It is acknowledged by Physicians to be the best Food

For Infants, Dyspeptics and Invalids.

Prof. J. Lewis Smith Says,

Speaking of **HORLICK'S FOOD:** "Being carefully prepared, according to Liebig's Formula, by Chemists fully competent, it possesses certain advantages, such as quick and easy preparation and a pleasant flavor, and is therefore highly esteemed by those who have used it." [*Page 58 of the fourth edition of a Treatise on Diseases of Infancy and Childhood. By J. Lewis Smith, M. D., etc.*—1879] Also, speaking in another place [page 647] of artificial food for infants, especially those suffering from intestinal catarrh, he says: "I prefer Liebig's, especially **HORLICK'S** preparation of it."

Report from Bellevue Hospital, New York.

In *The Hospital Gazette* for February 6th. 1879 [page 108] Dr. E. Hochheimer makes a report from BELLEVUE HOSPITAL of a case of Infantile Paralysis, which was followed by an exhausting diarrhœa—Speaking of the treatment, he says: "Her condition continued unchanged for the next three weeks; she was put upon a diet consisting principally of milk, but the diarrhœa persisted in spite of opiates and astringents."

"*Nov. 17th.—Milk was stopped, and she was put upon a diet of HORLICK'S FOOD; after this she began to mend, the diarrhœa became less and finally disappeared; she began to gain flesh, and her general condition was much improved.*"

We also beg to refer, by permission, to the following eminent medical men, who have used our Food extensively in their practice:—**Prof. DeLaskie Miller,** (Rush Medical College); **Prof. Wm. H. Byford,** (Chicago Medical College); **Prof. J. Adams Allen,** (Rush Medical College); **Drs. J. P. Oliver** and **C. P. Putnam,** (Harvard Medical School); **Prof. Gawne,** (Cleveland Medical College); and several hundred others whose testimonial letters are on file in our office.

PRICE, 75 Cents per bottle. Trial Size, 40 Cents.

BETHESDA WATER.

BELLEVUE, PA., May 21st, 1879.

W. B. HYATT, M.D.,

Marshallville, Wayne Co., Ohio.

DEAR SIR:—Your letter received this morning. Am sorry my friend Dr. S. did not think to tell you to address me at Pittsburg, and your communication would have reached me in a few hours instead of days, as I seldom call at the village P. O.

You will address your orders for BETHESDA WATER to JOSEPH FLEMING, 84 Market Street, Pittsburg, Pa., and they will receive prompt attention. I say this on account of my business acquaintance with Mr. Fleming. I will call on him in the morning, and have him send you pamphlets and any information relative to the matter he may think required.

If my testimony regarding the efficacy of Bethesda Water was required, I could cite several cases of my own personal knowledge. I am convinced that it is a specific in diseases arising from a morbid condition of the kidneys, providing, of course, that the disease has not reached a point beyond the possibility of recovery, as in the case of my late brother, and even then no figures could estimate its value in giving relief from suffering. I have a friend who was under treatment of different physicians all last fall and winter, and apparently getting worse: I persuaded him to stop the treatment and use the "water," and before he had used ten (10) gallons he was much better, and now nearly if not quite well. The doctors would diagnose Phlebitis, but there was a low specific gravity of the urine and other indications of kidney or dropsical affection, which satisfied me that he needed the effects of the "water;" and the results are as stated, and the inflamed vein is getting well, as well as general improved health. It occurs to me, the duty of physicians to investigate such things, and if they contain medicinal virtues, to make it known to suffering humanity instead of standing aloof until men in other walks of life have long recognized and demanded its use. Of course, there are so many new remedies claimed that are worthless, that there is some excuse, yet this Bethesda Water has been in use more than ten (10) years, and comparatively few physicians appear to know anything about its properties. Although you are a stranger to me, allow me to commend you, or any worthy physician who is willing to investigate and test its claimed virtues, and if found, to disseminate the knowledge among their less fortunate fellows. Yours, truly,

W. J. THOMPSON.

P. S.—If you have occasion to address me further, send your letter to Auditor's Office, P. A. R. R., Pittsburg, Pa.

Sunnyside Medical Retreat

For Mental and Nervous Diseases, Inebriety and the Opium Habit,

FORT WASHINGTON, NEW YORK CITY.

This home, situated on the banks of the Hudson, under the management of Dr. Edward C. Mann, late Medical Superintendent of the New York State Emigrant Insane Asylum, receives cases of either sex affected with mental disorders, Inebriety or the Opium habit. The beauty of location and surroundings, handsomely furnished apartments, and the attentions and comforts of home life, all combine to make Sunnyside an attractive and popular private retreat. Applications may be made to Dr. Mann, either by mail or personally, at Fort Washington. Twelve trains daily from Hudson River Depot, 30th St., and 10th Ave. Broadway and 23d St. line of stages run direct to depot. The profession respectfully invited to call, and cordially welcomed. 1152-1y

WOMAN'S HOSPITAL MEDICAL COLLEGE

337 and 339 S. Lincoln St., Chicago.

The *Tenth Annual Course of Lectures* will commence the first Tuesday in October, 1879, and continue twenty-one weeks. The Spring Term will commence April 1st, and continue twelve weeks. College building new. Clinical and Dissecting advantages unsurpassed.

FACULTY.—William H. Byford, A.M., M.D., President, Obstetrics; T. Davis Fitch, M.D., Gynecology; Chas. Warrington Earle, M.D., Treasurer, Diseases of Children; Isaac N. Danforth, M.D., Pathology; John E. Owens, M.D., Surgery; Henry M. Lyman, A.M., M.D., Practice of Medicine; Daniel R. Brower, M.D., Secretary, Nervous and Mental Diseases; Sarah Hackett Stevenson, M.D., Corresponding Secretary, Physiology; David W. Graham, A.M., M.D., Anatomy; Plymouth S. Hayes, M.D., Chemistry; Wm. J. Maynard, A.M., M.D., Therapeutics and Dermatalogy; Wm. T. Montgomery, M.D., Eye and Ear; E. Fletcher Ingals, M.D., Diseases of Chest and Throat; John O. Hobbs, M.D., Demonstrator.

DR. McINTOSH'S

Natural

UTERINE SUPPORTER.

No instrument has ever been placed before the medical profession which has given such universal satisfaction. The combination is such that the Physician is able to meet every indication of Uterine Displacements. Falling Womb, Anteversion, Retroversion and Flexions are overcome by this instrument, where others fail; this is proven by the fact that since its introduction to the Profession it has come into more general use than all other instruments combined.

Among the many reasons which recommend this Supporter to the Physician is its self-adjusting qualities. The Physician after applying it need have no fear that he will be called in haste to remove or readjust it, as is often the case with rings and various pessaries held in position by pressure against the vaginal wall, as the patient can remove it at will and replace it without assistance.

The Abdominal Supporter is a broad morocco leather belt, with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen. The Uterine Support is a cup and stem made of highly polished hard rubber, very light and durable, shaped to fit the neck of the womb, with openings for the secretions to pass out; as shown by the cuts. Cups are made with extended lips, to correct flexions and versions of the womb.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, passing down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic adapt themselves to all the varying positions of the body, and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Anteversion, Retroversions, or any Flexions of the Womb, and is used by the leading Physicians with never failing success, even in the most difficult cases.

Price—to Physicians, $8.00; to Patients, $12.00

Instruments sent by mail, at our risk, on receipt of price with 16 cents added for postage, or by Express, C. O. D.

DR. McINTOSH'S NATURAL UTERINE SUPPORTER CO.,
192 JACKSON STREET, CHICAGO, ILL.

Our valuable pamphlet "Some Practical Facts about Displacements of the Womb," will be sent you free on application.

MIAMI MEDICAL COLLEGE OF CINCINNATI.

Member of the American Medical College Association.

FACULTY.

JOHN A. MURPHY, M.D., Professor of Principles and Practice of Medicine and Clinical Medicine.
WM. H. MUSSEY, M.D., Professor of Operative and Clinical Surgery and Surgical Diseases of Women.
E. WILLIAMS, M.D., Professor of Ophthalmology, Aural Surgery and Clinical Ophthalmology.
WM. CLENDENIN, M.D., Professor of Descriptive and Surgical Anatomy.
WM. H. TAYLOR, M.D., Professor of Obstetrics and Clinical Midwifery.
THOMAS H. KEARNEY, M.D., Professor of Principles of Surgery, Surgical Diseases and Clinical Surgery.
J. C. MACKENZIE, M.D., Professor of Physiology and Pathology and Clinical Medicine.
J. F. JUDGE, M.D., Lecturer on Chemistry and Toxicology.
WM. B. DAVIS, M.D., Professor of Materia Medica and Therapeutics.
BYRON STANTON, M.D., Professor of Diseases of Women and Children and Clinical Gnyæcology.
WM. H. DE WITT, M.D., Lecturer on Mental Diseases.
B. P. GOODE, M.D., Lecturer on Diseases of Children.
ROBT. SATTLER, M.D., Lecturer on Diseases of the Eye and Ear.
A. D. BENDER, M.D., Lecturer on Laryngoscopy and Diseases of the Throat, and Demonstrator of Anatomy.
C. A. LE BOUTILLIER, M.D., Lecturer on Surgical Dressings.
CHAS. W. MATHERS, M.D., Demonstrator of Anatomy.
WM. L. DUDLEY, Demonstrator of Chemistry.

THE PRELIMINARY TERM of Lectures will begin September 3d, 1879, and continue one month. This Course will be one of *unusual interest and importance* to physicians as well as students.

THE REGULAR WINTER SESSION will begin October 1st, 1879, and continue five months. This course will consist of Didactic Lectures with Demonstrations, Recitations, Clinical and Special Instruction, involving Physical Manipulations. From five to six Didactic Lectures and Demonstrations are delivered daily, covering the general topics of Medicine and Surgery as taught in all regular medical colleges.

CLINICS.—The Faculty confidently announce that students have, in this college, unsurpassed clinical advantages. *Four Special Clinics* are held daily, in the college building (at which more than six thousand patients are examined annually), viz.: In Practice, Surgery, Gynæcology, Diseases of Children, Ophthalmology and Larnygology, in all of which advanced students have opportunities to make full examinations, especially in *Thoracic Diseases* and *Gynæcology*, and frequently to witness *Obstetric* cases. These clinics are free to students of the college. Two clinical lectures are delivered daily at the Cincinnati Hospital (near the college), during the entire college session.

The College also affords the fullest advantages in *Practical Chemistry*, *Practical Anatomy*, *Practical Physiology* and *Microscopy*.

FEES.

Matriculation fee (annually)	$ 5 00	Demonstrator's Ticket	$5 00
Regular Lecture Term	75 00	Hospital Ticket	5 00
Graduation Fee	25 00	Alumni of this institution free.

EDWARD W. JENKS, M.D., L.L.D.,
Professor of Medical and Surgical Diseases of Women, and of Clinical Gynecology.

E. O. F. ROLER, A.M., M.D.,
Professor of Obstetrics and Diseases of Children.

SAMUEL J. JONES, A.M., M.D.,
Professor of Ophthalmology and Otology.

J. HOLLISTER, M.D.,
Cor. Secretary & Registrar, Professor of General Pathology and Pathological Anatomy.

J. S. JEWELL, A.M., M.D.,
Professor of Nervous and Mental Diseases.

H. P. MERRIMAN, A.M., M.D.,
Professor of Medical Jurisprudence and Hygiene.

WM. E. QUINE, M.D.,
Professor of Materia Medica and General Therapeutics.

MARCUS P. HATFIELD, A.M., M.D.,
Professor of Chemistry and Toxicology.

LESTER CURTIS, A.M., M.D.,
Professor of Histology.

R. L. REA, M.D.,
Professor of Anatomy.

HENRY GRADLE, M.D.,
Lecturer upon Physiology.

ROSWELL PARK, A.M., M.D.,
Demonstrator of Anatomy and Assistant to the Chair of Anatomy.

GRADED COURSE OF INSTRUCTION.

A graded system of medical instruction was adopted at the organization of this College, twenty years ago, and for twelve years it was the only representative of a classified course in this country. The recommendation of this method of teaching by two Medical College Conventions, by the American Medical Association, and by various State Medical Societies; and its more recent adoption by a number of other colleges, including some of the most prominent ones in the land; and its very general approval by the profession at large, afford gratifying evidence that this new departure was a movement in the right direction.

REQUIREMENTS FOR ADMISSION.

All applicants for admission are required to present evidence of graduation in some literary college, or certificates of attendance upon some scientific school or academy. If the applicant have neither diploma nor certificate, he must sustain a satisfactory examination as to his literary qualifications.

ADVANCED STANDING.

Students who have read medicine for one full year may enter upon the *Middle Course*, by sustaining satisfactory examinations upon studies embraced in the Junior Course.

Students who have read medicine for two years, including attendance upon one full course of lectures in some recognized medical college, may enter the *Senior Course*, by sustaining examinations upon the subjects embraced in the Junior and Middle Courses.

THE COLLEGE TERM.

A Preliminary course of Didactic and Clinical instruction, introductory to the general course, commences September 16th and continues till the commencement of the regular Session.

THE REGULAR COURSE of lectures commences Tuesday, September 30th, and will continue until March 30th, at which time the usual Commencement exercises will be held.

THE PRACTITIONERS' COURSE,

Designed for practitioners, will commence March 31st, 1880, following the Commencement, and will continue till April 28th. This special course is arranged to meet a very general want, and will afford special advantages for a *rapid*, yet *thorough*, practical review of the most important subjects in medicine and surgery.

CLINICAL ADVANTAGES.

Mercy Hospital, with its very perfect appointments; the Dispensary and the College clinics, offer an abundance of clinical material in every department of Medical and Surgical teaching. Over fourteen thousand patients were treated here during the *last year*.

In the Hospital every Senior student serves as dresser for an allotted term in the surgical wards, and receives a certificate to that effect.

Every Senior student has personal charge of one or more cases of obstetrics, under the immediate supervision of the Professor of obstetrics.

In the Gynecological Department, where large numbers of females apply for local treatment, each Senior student is trained by the Professor in the minute details of examination and treatment of the medical and surgical diseases of women.

PHYSIOLOGICAL LABORATORY.

Aided by the generous contributions of its alumni, this College is developing a PHYSIOLOGICAL LABORATORY, which will be opened for instruction during the present year.

PRIZES

Will be given by the Dean, for the best Thesis; by the Professor of Anatomy, a First Prize to the best Anatomist—open to all classes; Second Prize to the best Anatomist in the Junior Class; the Senn Prize, for the best Anatomical Preparation; and the Earl Prize, for the best Essay on Diseases of Children.

FEES.

Lecture Fees for the College Year, $75.00. Practitioners' Course, $30.00. Graduation Fee, $30.00. Registration Fee, $5.00. Demonstrator's Ticket, $5.00. Laboratory Ticket, $5.00. Hospital Ticket, $6.00.

For information concerning Text Books, Board, Seats in the College, requirements for Graduations, etc., consult the Annual Announcement, or address

PROF. J. H. HOLLISTER, M.D.,
SECRETARY AND REGISTRAR.
73 Randolph Street, Chicago, Ill.

1167, 68, 70, 72, 75, 76

DETROIT MEDICAL COLLEGE.

(MEMBER OF THE AMERICAN MEDICAL COLLEGE ASSOCIATION.)

SESSIONS OF 1879-'80

FACULTY.

JAMES F. NOYES, M.D.,
Emeritus Professor of Ophthalmology and Otology.

THEO. A. McGRAW, M.D., President,
Professor of Principles and Practice of Surgery and Clinical Surgery.

GEORGE P. ANDREWS, M.D.,
Professor of Principles and Practice of Medicine and Clinical Medicine.

C. B. GILBERT, M.D.,
Professor of Obstetrics, and Diseases of Women and Children.

N. W. WEBBER, M.D.,
Professor of General and Descriptive Anatomy, and Clinical Surgery.

SAMUEL P. DUFFIELD, PH.D., M.D.,
Professor of Toxicology and Medical Jurisprudence.

ALBERT B. LYONS, M.D.,
Professor of Chemistry and Director of the Chemical Laboratory.

LEARTUS CONNOR, M.D., Secretary,
Professor of Physiology and Diseases of the Eye and Ear.

H. O. WALKER, M.D.,
Lecturer on Anatomy and Genito-Urinary Diseases.

E. L. SHURLY, M.D.,
Lecturer on Materia Medica, Therapeutics and Clinical Laryngology.

HAL. C. WYMAN, M.D.,
Lecturer on Physiology.

J. G. JOHNSON, M.D.,
Lecturer on Diseases of Mind and Nervous System.

J. H. CARSTENS, M.D.,
Lecturer on Clinical Medicine.

F. A. SPALDING, M.D.,
Lecturer on Diseases of the Skin.

C. C. YEMANS, M.D.,
Lecturer on Chemistry.

E. A. CHAPOTON, M.D.,
Demonstrator of Practical Physiology and Instructor in Anatomy and Surgery.

J. W. ROBERTSON, M.D.,
Demonstrator of Practical Microscopy.

DAVID INGLIS, M.D.,
Instructor in Chemistry and Physiology.

E. B. WARD, M.D.,
Curator of Museum and Librarian.

The Collegiate Year is divided into three sessions.

Preliminary Session opens Wednesday, September 3d, 1879, and closes September 30th. The Clinics are held and the Lectures delivered by the Professors of the regular Faculty, and in the same order and frequency as during the Winter Term. Opportunity is given to dissect or work in the Chemical and Physiological Laboratories.

The Regular Session opens Wednesday, October 1st, 1879, and closes March 2d, 1880. During this term all the branches of *General Medicine* and *Surgery*, both scientific and practical, are taught with care and thoroughness. All students are daily examined on the subjects of the lectures and on their dissecting and laboratory work.

Senior students have *daily practice* in the *art of examining patients*, in forming their own diagnosis, prognosis and treatment. As this is done under the direction of the professor holding each clinic, and in the presence of the class, it constitutes an invaluable course of training.

The **Recitation Session** begins March 10th, 1880, and closes June 23d, 1880. Daily during this term will be held recitations for both Seniors and Juniors, and one or two clinics and a lecture.

The recitations will embrace a thorough drill upon the general subjects of the Regular Session, viz.: Anatomy, Chemistry, Physiology, Practice of Medicine, Materia Medica and Therapeutics, Surgery, Obstetrics, Diseases of Women and Children.

Though the Recitation and Preliminary Sessions are optional, it is hoped that all who can will avail themselves of their manifest advantages in commencing the study of medicine, or in supplementing the regular winter course.

Three Hospitals—Harper's, St. Mary's and St. Luke's—with two large free dispensaries, afford an abundance of clinical material for illustrative and practical teaching.

All lectures are delivered on Hospital grounds. The *peculiar feature* of this school is the *intimate union* between its *laboratory*, *clinical* and *didactic* instruction.

Fees.—For Preliminary and Regular Sessions: Matriculation, $5. Hospital Fees, $10. Lecture Fees, $40. Graduation, $25. Lecture Fees to third course students, $25.

For the Recitation Term the Lecture Fees are $10, to those who attend the other courses. All others are required to matriculate and take out the Hospital tickets.

All fees payable in advance to the *Secretary*.

Announcement and Catalogue, or any further information which may be desired, can be promptly obtained by addressing

LEARTUS CONNOR, M.D., Secretary,
92 Cass Street, Detroit.

1165-1190

SPECIAL FACTS CONCERNING

BELLADONNA PLASTER

IN RUBBER COMBINATION.

PREPARED BY

SEABURY & JOHNSON.

In undertaking the manufacture of Medicinal Plasters we had but one object in view—THE IMPROVEMENT OF ALL KINDS OF PLASTERS. Among the various plasters manufactured by us was BELLADONNA PLASTER. This article met with a larger demand than some of the others, acquired a reputation among the best druggists, and received the confidence of the profession. Its large sale interfered with rival manufacturers, and continuous efforts have been made on their part to prejudice physicians against it.

As these attacks have been of late more malicious than usual, we have deemed it advisable, in self-defence, and in order to place our article fairly before the practitioner, to assign reasons why we consider it the most thoroughly reliable preparation ever offered the medical profession. First, it is a combination of the Alcoholic Extract of Belladonna only, with purified rubber, and thus possesses all of the advantages of the rubber base, being pliable, convenient of application, and not subject to the deteriorating influence of age, as is the case when any other base is used. Secondly, it is freed from all irritative properties. Thirdly, it is more adhesive than any other plasters. Fourthly, we believe it to be as perfect, in every respect, as it is possible to make a Belladonna plaster.

ENGLISH EXTRACTS—WHY WE DO NOT EMPLOY THEM.

Imported English Extracts are prepared from the Inspissated Juice of the leaf, while our pharmacopœia formula is treated by Alcohol. The active principle of Belladonna (Atropia) is only partially obtained by Inspissation. The employment of Alcoholic or Hydro-Alcoholic Solvents completely exhausts the entire strength of the drug.

The value of both preparations is clearly presented in an able treatise published in the *American Journal of Pharmacy*, April 1876, page 145. Our own investigations are substantially identical :—

TABLE OF RESULTS,

	Test solution requisite for 100 cc. of Ext. Solution.	Percentage of Atropia in Extract.
EXT. BELLADONNÆ ALCOH. U. S. P.	*17·732*	*2·571*
GEO. ALLEN & CO., English	*9·73*	*1·411*
HERRINGS & CO., "	*8·133*	*1·179*
E. MERCK, Germany (aqueous extract), made 1869	*1·9*	*·275*

This analysis clearly establishes the fact that the **Alcoholic Extract of Belladonna of the U. S. P. averages over twice the strength of English Extracts,** and should, therefore, be preferred in all cases where a reliable article is desired. Inspissated and Aqueous Extracts deteriorate, while Alcoholic remain stable.

Therefore the assumption of pretentious manufacturers, that the English Extracts are the superior preparations, must be based on a former supposition rather than present facts. The following analysis substantiates our claim regarding English Extracts.

ANALYSIS OF BELLADONNA PLASTERS, BY PROF. R. OGDEN DOREMUS.

"BELLEVUE HOSPITAL COLLEGE, New York, Sept. 7, 1878.

"GENTLEMEN—I obtained from Messrs. W. H. Schieffelin & Co., of this city, samples of Belladonna Plasters prepared by Grosvenor & Richards, Boston ; Mitchell Novelty Plaster Works ; Seabury & Johnson, New York and London. I have examined these varieties for the purpose of determining which possesses the largest quantity of Atropine. I employed equal surfaces of each, and *my analysis demonstrated that* SEABURY & JOHNSON'S *contains the greatest proportion* of the active principle of Belladonna. "R. OGDEN DOREMUS, M.D., L.L.D."

Belladonna Plaster, prepared by Seabury & Johnson, is packed in elegant tin cases, which contain 1 yard each, and can be obtained of almost any druggist throughout the United States and Canada, or will be furnished direct by mail. Samples sent on application.

A NEW FORM OF MEDICATION,

COMBINING

Reliability and Accuracy for the Physician,
Convenience and Elegance for the Pharmacist.

Saccharated Extracts.

THE DRY, SOLUBLE, EXTRACTIVE MATTER OF THE DRUG IS TRITURATED WITH MILK SUGAR IN SUCH PROPORTION THAT ONE TROY OUNCE OF THESE EXTRACTS REPRESENTS ONE TROY OUNCE OF THE DRUG.

A Soluble Drug of Uniform Strength and Quality.

The **percentage of Dry Extract** is in all cases **indicated** on the label.

In the more **powerful remedies** the **percentage** of **alkaloid** is also indicated.

The advantages of the **Saccharated Extracts** over ordinary extracts are:—

1. They are stable at all temperatures and under all conditions; they will not swell, ferment, or waste.
2. They are always of a uniform and convenient consistency, not becoming solid, as is the case with ordinary powdered extracts.
3. Their division is rapidly effected, and with great convenience.
4. Their invariability in strength renders them capable of being prescribed with precision.
5. Their general application to any form of medication, as Capsules, Compressed Pills, Troches, etc.

DR. L. D. McINTOSH'S

Electric or Galvanic Belt.

If this new combination could be seen and tested by the medical profession, few, if any, words would be needed from us in its favor, for it combines utility with simplicity in such perfection that seeing it is convincing proof of its great value. The medical profession to-day acknowledge, almost universally, Electro-Therapeutics.

This combination is composed of sixteen cells, placed in pockets on a belt. Each cell is made of hard vulcanized rubber, lined with a copper cell, which constitutes the negative plate. The rubber coating perfectly insulates each cell. The positive plates are of zinc, wrapped in a porous material, to absorb the exciting fluid and prevent contact with the copper, and permit the current to pass from the copper to the zinc.

Thus the cells are charged without wetting the belt, and the discomfort following to the patient. A wire is soldered to each zinc plate, which connects with the copper cell by entering a tube on its side, thus rendering the belt pliable.

The McIntosh Electric Belt is superior to all others for the following reasons:—

It is composed of sixteen cells—thus giving a powerful current. A current selector is so arranged that one or more cells can be used at pleasure. There is not anything irritating about the Belt, as is the case with all other contrivances where the metal used is wet with weak acids and placed next to the skin. The electrodes are pieces of metal covered similar to ordinary battery electrodes, and connected with the cells by connecting cords. By this arrangement, a current from the Belt can be applied, to produce a general or local effect.

Physicians who have used this belt in their practice do not hesitate to recommend it to the profession.

Our pamphlet on Medical Electricity sent free on application. Address

McINTOSH GALVANIC BELT AND BATTERY CO.,

192 and 194 Jackson St., Chicago, Ill.

HORSFORD'S
Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges.

MANUFACTURED BY THE

RUMFORD CHEMICAL WORKS,

BE CAREFUL TO SPECIFY McKESSON & ROBBINS'.

IMPORTANT TO PHYSICIANS!

The fact that Sulphate of Quinine is only soluble in over 700 parts of water is not generally known, or if known is not usually considered, except in prescriptions, when this difficulty is overcome by the addition of Acid; and the further fact that **Bi-Sulphate of Quinine** is soluble in **only 10 parts of water** is as little appreciated.

McKesson & Robbins have paid much attention to the subject of putting Quinine into Pills, in a condition approaching that of a solution, and have at last succeeded in their **BI-SULPHATE OF QUININE PILLS,** and offer the same to the profession, confident that they will stand any test for solubility and prompt action. Physicians will please always specify **McK. & R. Bi-Sulph. Quinine Pills,** and they will not be disappointed in results.

Note.--With no reference to *respectable* druggists, we would say that cases have come to our knowledge and have been noted, where other pills have been substituted on prescriptions for ours.

POWDERED PURIFIED CHINOIDINE.

Containing all the Non-Crystalizable Alkaloids of Cinchona Bark.

Similar preparations have been lately offered in market AT HIGH PRICES under different fancy appellations, and claims made for the same as of equal efficiency with Quinine.

As a great demand exists for a cheap anti-malarial remedy, we introduce this preparation at low figures; and, in order that the profession may judge practically of its merits, will forward a sample to any physician's address, or mail one ounce upon receipt of FIFTY CENTS.

Yours respectfully,

McKESSON & ROBBINS,

Wholesale Druggists and Manufacturing Chemists,

91 FULTON ST., NEW YORK.

GRANULATED EFFERVESCENT SALTS

PREPARED BY

WILLIAM R. WARNER & Co.,

CHEMISTS,

PHILADELPHIA.

Granulated Effervescent

VICHY SALT.

(Grand Grille.)

A large teaspoonful dissolved in half a glass of water, forms a grateful and refreshing draught, identical with the natural water. Per dozen, $4.00

Granulated Effervescent

SELTZER SALT.

A tablespoonful to half a glass of water forms a grateful and refreshing saline draught, identical with the natural water. Per Dozen, $4.00

Granulated Effervescent

SEIDLITZ MIXTURE.

(Seidlitz Powder, U. S. P.)

An excellent aperient and refrigerant, very acceptable to the stomach. Per doz. $4.00

DOSE.—One tablespoonful in a glass of water.

Granulated Effervescent

NITRATE of POTASSIUM.

A dessert-spoonful in glass of water makes an excellent mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

CITRATE OF POTASSIUM.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $5.00

Granulated Effervescent

Bi-Carbonate of Potassium.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

Pepsin, Bismuth and Strychnia.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin, soluble Citrate of Bismuth, and the sixtieth grain of Citrate of Strychnia. Per dozen, $10.00

Granulated Effervescent

PEPSIN AND BISMUTH.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin and soluble Citrate of Bismuth. Per doz. $9.00

Granulated Effervescent

CITRATE OF MAGNESIA.

(Pleasant and Efficient.)

For a purgative effect, take two or more tablespoonfuls added to a small glass of water, and drink while effervescing. As a laxative, one or more tablespoonfuls taken in the same manner. One or two teaspoonfuls in sweetened water, produces a delightful, cooling drink in summer. Per dozen, $4.00

Granulated Effervescent

CITRATE LITHIA.

Each drachm or teaspoonful contains four grains of the chemically pure salt. Valuable in Rheumatic, Gouty and Analogous disorders. Per dozen, $10.00

Granulated Effervescent

KISSINGEN SALT.

A large teaspoonful dissolved in half a glass of water, forms an agreeable and refreshing draught identical with the natural water. Per dozen, $4.00

Granulated Effervescent

CRAB ORCHARD SALT.

Prepared from the exact analysis of the purified natural salt, obtained from the Crab Orchard Spring, Ky.

A tablespoonful in half a glass of water forms a grateful effervescing draught, producing the effect of the natural water. Per dozen, $4.00

Granulated Effervescent

OXALATE OF CERIUM.

Each drachm or large teaspoonful contains two grains of Oxalate of Cerium. Per dozen, $5.00

Granulated Effervescent

CITRATE CAFFEINE.

A dessert-spoonful containing one grain of Citrate of Caffeine should be given for sick headache, every hour or two before and during the paroxysms. Per dozen, $10.00

HUNYADI JANOS MINERAL WATER.

THE BEST AND CHEAPEST

THE BRITISH MEDICAL JOURNAL.

"HUNYADI JANOS.—The most agreeable, safest and most efficacious aperient water which has been brought under our notice."

THE LANCET.

"HUNYADI JANOS.—Baron Liebig affirms that its richness in aperient salts surpasses that of all other known waters."

NATURAL APERIENT.

LONDON MEDICAL RECORD.

"*Hunyadi Janos.*—The most pleasant and, owing to the smallness of its dose, the CHEAPEST of all the natural Aperient Waters."

From Prof. MACNAMARA, Prof. of Materia Medica, Royal College of Surgeons in Ireland.

"Far the most valuable and palatable of our Aperient Mineral Waters. I have been agreeably surprised with the result of a clinical investigation."

Specially approved by the Academy of Medicine of Paris, and its sale in France authorized by decree of the French Government.

Medals awarded: Lyons, 1872. Vienna, 1873. Paris, 1878.

USES OF HUNYADI JANOS	ACCORDING TO OPINIONS OF EMINENT AUTHORITIES.
1. For habitual constipation.	"None so prompt, mild, and can be so well borne for a length of time."—Prof. SPIEGELBERG, *University of Breslau.*
2. By persons inclined to obesity, congestive and gouty disorders.	"I have used the Hunyadi Janos water in many cases of the rheumatic and gouty diathesis with very marked benefit. In cases accompanied with great obesity I prefer it to any other laxative."—Prof. LEWIS A. SAYRE, M.D., *Bellevue Hospital, New York.* "Preferred to Friedrichshall and Pullna by those who have tried them."—Prof. AITKEN, F.R.S., *Netley.* "Of great use in catarrhal conditions of the pile-ducts and bowels, and for CONGESTION of the LIVER and OTHER ORGANS."—*Medical Times and Gazette.*
3. In chronic affections of the organs of respiration and Circulation.	"Produces remarkable relief in chronic diseases symptomatic of affections of the abdominal and thoracic organs, and in serous effusions with impediment of respiration and circulation."—Prof. ADOLF MARTIN, *Royal Medical Councillor, University of Munich.*
4. Against hæmorrhoids, and portal and hepatic congestion.	"The most certain and the most comfortable in its action of all the aperient waters. The special indications for its use are, in costiveness (especially in that of pregnancy), in portal congestion with tendency to hæmorrhoids, and in sluggish action of the liver."—Inspector-General MACPHERSON, M.D., *Author of "Baths and Wells of Europe."*
5. During pregnancy; for nursery use; and in many female disorders.	"I prescribe none but this."—Baron v. SCANZONI, *Wurzburg.* "I prefer this to any and every other."—Dr. MARION SIMS, *New York, Honorary Fellow Obstetrical Society of London and Dublin.*
6. In bilious attacks and sick headaches.	"I have made use of the Hunyadi Janos mineral water ever since its introduction into this country, and with ever increasing satisfaction. It is highly beneficial to persons of sedentary habit, and in what are called bilious attacks."—Dr. SILVER, *Lecturer on Clinical Medicine, Charing-Cross Hospital.*
7. Against evil consequences of indiscretion in Diet.	"Has invariably good and prompt success: a most valuable item in the balneological treasury."—Prof. VIRCHOW, *Berlin.*

For ordinary aperient purposes a half wineglassful of the Hunyadi Water may be taken at bed-time, or a wineglassful taken in the morning fasting. It is most efficacious when warmed to a temperature not below 60 deg., or when an equal quantity of hot water is added to it.

HUNYADI JANOS MINERAL WATER.

INDISPENSABLE TO THE TRAVELLING PUBLIC.

To secure the genuine Water, require bottles with a blue label bearing the name

The APOLLINARIS COMPANY, Limited, 19 Regent St., London, England.

DUREL'S
TAR AND IRON SYRUP AND CAPSULES.
PREPARED BY DUREL, PHARMACIST, PARIS.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron is a desideratum which has at last been attained in these preparations. The indications for such a remedy are many, but it has been found especially useful in CHLOROSIS, BRONCHIAL CATARRH, CATARRH OF THE BLADDER, CHRONIC UTERINE DISCHARGES, depending upon an enfeebled or relaxed state of the system.

Sold by Chemists generally.

CRINON'S HÆMOGLOBIN,
The Albuminoid Ferruginous Principle of Blood.

HÆMOGLOBIN is the only physiological chalybeate. Associated as it is with the phosphates of the blood, it forms the most powerful of tonics, and at the same time a most nourishing food. It is especially useful in cases of *Anæmia*, *Chlorosis*, *Cachexias*, *Exhaustion* caused by excess of work, nervous debility, fatigue resulting from parturition and lactation. It replaces entirely liquid blood, which has been recommended and used with success in *Phthisis* and *wasting away*.

It is offered in two forms: In cachets (wafers), 60 of which are contained in a box; combined with chocolate in small squares, 30 of which are in a box; both forms can be sent by mail.

Prepared by C. CRINON, Paris, Pharmacist of the first class, Laureate of the Hospitals of Paris. Samples may be obtained by application to

E. FOUGERA & CO., New York, Agents for the U. S.

FOUGERA'S COMPOUND IODINISED
COD LIVER OIL.

Since the introduction of this oil in 1858, it has been found to be superior to all other kinds of Cod Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod Liver Oil, but also the **tonic, stimulant** and **alterative** properties of **Iodine, Bromine** and **Phosphorus**, which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod Liver Oil.

Through its **increased curative action, FOUGERA'S COD LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod Liver Oil would fail entirely.

FOUGERA'S READY-MADE MUSTARD PLASTERS.

A most useful, convenient, clean, and economical preparation. Not liable to change if kept in a dry place. Made of two strengths. Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll, of 10 plasters each. DIRECTIONS.—Dip the Plaster, or Plasters, a minute or two, in cold water; apply on the part, and cover with a band.

FOUGERA'S COMPOUND ICELAND MOSS PASTE.
(Iceland Moss, Lactucarium, Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, etc.

Wakefulness, Cough, and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this Paste.

FOUGERA'S IODO-FERRO-PHOSPHATED ELIXIR OF HORSE-RADISH.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of antiscorbutic and aromatic plants, and acts as a **tonic, stimulant, emmenagogue**, and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

SOLD BY DRUGGISTS GENERALLY.

PNEUMATIC ASPIRATION,

AFTER THE MANNER OF DIEULAFOY.

"It is always possible, owing to Aspiration, to search for a fluid collection without any danger, whatever may be its seat or its nature."

"I have thrust these needles into almost every part of the body; into the Joints, the Liver, the Spleen, the Bladder, the Intestines, the Lungs and the Meninges; and I can affirm, and a great number of observers affirm with me, that we have never seen consecutive accidents."—*Dieulafoy on Pneumatic Aspiration*, pp. 21, 24.

We invite the attention of the Medical Profession to this New Apparatus for Aspiration, constructed upon the general plan of Potain's modification of Dieulafoy's Aspirator, but containing the following improvements and inventions of our own:—

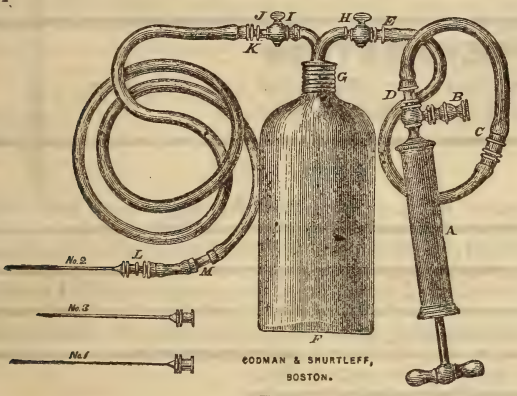

Fig. 77.

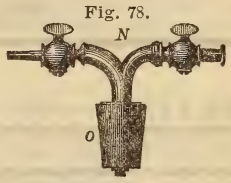
Fig. 68.

Fig. 78.



The Stopper and Cocks supplied with Apparatus No. 2.

1st. Means of changing the pump from an exhaust to a force-pump, and *vice versa*, thereby enabling the operator not only to draw an abnormal fluid, but to inject the cavity through the tubes and needle of the apparatus with one adapted to induce healthy action.—*See Dieulafoy on Aspiration*, pp. 276, 278.

2d. The employment, in our apparatus No. 1, of a metal Screw Cap, fitting the neck of the receiver supplied with this apparatus so securely that it cannot be forced from its place by condensed air while injecting, or accidentally removed while the receiver is in a state of vacuum for aspiration

3d. The substitution, for the ordinary oiled silk valves of other apparatus, of a kind indestructible, both in form and material.

4th. A simple and comparatively inexpensive attachment for evacuating the contents of the stomach, equal, if not superior, to any in use hitherto.

Commendations bestowed upon our Aspirators, by physicians familiar with the latest European and American ones, lead us to believe that, in some important particulars, at least, they are superior to any.

In his work on Pneumatic Aspiration, Dieulafoy shows the harmlessness of the Aspiratory puncture, and its great superiority to the Exploring Trocar as a means of accurate diagnosis in all collections of Pathological Fluids. It has been used with unprecedented success in the Retention of Urine, Reduction of Strangulated Hernia, in Ascites, Hydrothorax, Empyema, Pneumothorax, Effusions into the Pericardium, Serous, Purulent and Hematic Effusions of the Knee, Hydrocele, Hydatid Cysts, Abscesses of the Liver, and in various other Pathological Lesions.

PRICES OF APPARATUS.

No. 1. Air Pump—exhaust or condensing as described; 16 oz. receiver, of strong glass, with screw-cap; three steel, gold plated Aspiratory Needles, together with the necessary tubes, stop-cocks, etc., as shown in Fig. 77, fitted in a neat case, accompanied with printed directions $16.00. Postage 64 cents.

No. 2. The same, without receiver, and with rubber stopper (see Fig. 78) to fit almost any bottle of quart capacity, or less, instead of screw-cap arrangement, also with printed directions $14.00. Postage 32 cents.

No. 3. Dieulafoy's Notched Aspirator, Nickel-plated, with two Needles, Tubes, etc., in case $14 00

No. 4. Stomach Attachment, as described, adapted to pump accompanying Nos. 1 and 2, additional $6.00. Postage 22 cents.

The foregoing are the product of our own factory, and are warranted in every respect.

Also, **Dieulafoy on Pneumatic Aspiration,** post-paid, by mail, on receipt of..... 3 40

☞ *Full description on application.*

An illustrated Catalogue of Surgical Instruments, also a New Pamphlet on Atomization of Liquids, with description of Improved Apparatus and Formulæ of Remedies successfully employed, will be forwarded, post-paid, on application.

TO THE MEDICAL PROFESSION.

MALTINE.

(Extract of Malted Barley, Wheat & Oats.)

THIS PREPARATION

Contains from three to five times the Medicinal and Nutritive elements found in Extract of Malt.

MALTINE is a highly concentrated extract of malted *Barley*, *Wheat*, and *Oats*, containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST.—In the manufacture of **MALTINE** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates, and Albuminoids, on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity, possessing little virtue aside from the saccharine matter which it contains.*

SECOND.—*Carbon*, *Hydrogen*, *Nitrogen*, *Sulphur*, *Iron*, *Magnesium*, and *Potassium*, are essential elements in the food of man, and it is only in **MALTINE**, containing the combined properties of malted *Barley*, *Wheat*, and *Oats*, that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD.—*Gluten* is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. **MALTINE** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH.—Liebig says, "Wheat and Oats stand first among our list of cereals in combining all the elements in proportions necessary to support animal life. They are especially rich in muscular and fat producing elements." The only reason we use Malted Barley, in the manufacture of **MALTINE**, is that it contains larger proportions of mineral matters (bone producers) and Diastase. It is deficient in all other essential elements.

We believe that any practitioner will readily recognize the superiority of MALTINE, and would request a trial and comparison of merits with any article offered for similar uses.

* As a sure test for Diastase, and the Albuminoids, a small quantity should be put in a test tube or small vial, largely diluted with water, and heated to the boiling point, when the Albumen, if present, will coagulate, and appear in little flocculent particles throughout the liquid. If the extract remains clear, it is proof that it has already been coagulated by excessive heat, and removed by filtration during the process of manufacturing. Any heat which will coagulate Albumen will inevitably destroy the digestive power of Diastase.

In corresponding with Advertisers please mention THE MEDICAL AND SURGICAL REPORTER.

The Nitrogenous constituents of *MALTINE* have a composition identical with that of the chief constituents of the Blood, and therefore contain nearly every element requisite for the reproduction of the human body.

MALTINE AND ITS COMPOUNDS

can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULÆ AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS, AND ON THE LABEL ATTACHED TO EACH BOTTLE:

***MALTINE* WITH HOPS.**

***MALTINE*, FERRATED:**

This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

***MALTINE* WITH PHOSPHATES IRON AND QUINIA:**

A powerful general and nutritive tonic.

***MALTINE* WITH PHOSPHATES IRON, QUINIA AND STRYCHNIA:**

A powerful nutritive, general and nervous tonic.

***MALTINE* WITH PEPSIN AND PANCREATINE:**

One of the most effective combinations in Dyspepsia, Cholera Infantum, and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the *MALTINE*. We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

***MALTINE* WITH BEEF AND IRON:**

One of the most valuable combinations in cases of General Debility, when there is deficient nutrition and a deficiency of Iron in the system

***MALTINE* WITH ALTERATIVES:**

In this preparation *MALTINE* is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.

MALTINE WINE.

This preparation contains all the medicinal and nutritive constituents of *MALTINE*, less 60 per cent. of the transformed starch or glucose, which renders the preparation lighter and more acceptable to some stomachs, and is recommended only in such cases.

***MALTINE WINE* WITH PEPSIN AND PANCREATINE:**

(Each fluid ounce of MALTINE WINE contains 15 grains pure PEPSIN and 15 grains pure PANCREATINE).

We can recommend this preparation to the Medical Profession as being the most important remedy ever brought to their notice in all cases of Dyspepsia and Imperfect Nutrition, when the system needs invigorating and replenishing. It will be found, we believe, a perfect remedy in Vomiting in Pregnancy, Cholera Infantum and wasting diseases of children, and in Constipation and Chronic Diarrhœa resulting from mal-nutrition. It will agree with the most irritable stomach.

MALTO-YERBINE.

(Each pint of the above preparation contains 13 ounces MALTINE, 2 ounces CARRAGEEN and 1 ounce YERBINE).

With the nutritive, emollient and demulcent properties of *MALTINE* and *CARRAGEEN*, and the expectorant qualities of *YERBINE* (active principle of Yerba Santa), we offer this preparation to the Profession with the fullest confidence that it is the most perfect remedy yet produced in Chronic Pulmonary Affections, Irritation of the Mucous Membrane, Difficult Expectoration, Bronchitis and ordinary Coughs and Colds.

The Dose of all Preparations of *MALTINE* and compounds is from a dessert to a tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only.*

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in half-pint, pint and five-pint amber bottles; each bottle inclosed in a folding paper box.

Manufacturing Pharmacists,
196 and 198 FULTON STREET, NEW YORK.

1137-1162-eow

TROMMER'S EXTRACT OF MALT.

The rapidly increasing demand for our IMPROVED EXTRACT OF MALT, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantities; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or moulding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expense of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops**, viz: MALT SUGAR, DEXTRINE, DIASTASE, RESIN and BITTER of HOPS, PHOSPHATES of LIME and MAGNESIA, and ALKALINE SALTS.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:—
Malt Sugar 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712. Alkalies .377; Water, 25.7; Total, 99.958.
In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article.

Yours truly, SILAS H. DOUGLAS,
Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt contains a larger quantity of the active properties of Malt than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ pounds of the Extract.

Our preparations of Malt are for sale by druggists generally, throughout the United States and Canada, at the following prices:—

EXTRACT OF MALT,	*With Hops (Plain),*	$1.00

BARON LEIBIG, the greatest authority on Infant Diet, states that the majority of children who die under one year of age, do so from the effects of improper food, or from the improper administration of the food.

HORLICK'S FOOD.

A Concentrated Extract, prepared according to the Formula of Baron Liebig, and, unlike other Foods,

IS NOT FARINACEOUS.

It is acknowledged by Physicians to be the best Food

For Infants, Dyspeptics and Invalids.

Prof. J. Lewis Smith Says,

Speaking of **HORLICK'S FOOD**: "Being carefully prepared, according to Liebig's Formula, by Chemists fully competent, it possesses certain advantages, such as quick and easy preparation and a pleasant flavor, and is therefore highly esteemed by those who have used it." [*Page 58 of the fourth edition of a Treatise on Diseases of Infancy and Childhood. By J. Lewis Smith, M. D., etc.*—1879] Also, speaking in another place [page 647] of artificial food for infants, especially those suffering from intestinal catarrh, he says: "I prefer Liebig's, especially **HORLICK'S** preparation of it."

Report from Bellevue Hospital, New York.

In *The Hospital Gazette* for February 6th. 1879 [page 108] Dr. E. Hochheimer makes a report from BELLEVUE HOSPITAL of a case of Infantile Paralysis, which was followed by an exhausting diarrhœa—Speaking of the treatment, he says: "Her condition continued unchanged for the next three weeks; she was put upon a diet consisting principally of milk, but the diarrhœa persisted in spite of opiates and astringents."

"*Nov. 17th.—Milk was stopped, and she was put upon a diet of HORLICK'S FOOD; after this she began to mend, the diarrhœa became less and finally disappeared; she began to gain flesh, and her general condition was much improved.*"

We also beg to refer, by permission, to the following eminent medical men, who have used our Food extensively in their practice :— **Prof. DeLaskie Miller,** (Rush Medical College); **Prof. Wm. H. Byford,** (Chicago Medical College); **Prof. J. Adams Allen,** (Rush Medical College); **Drs. J. P. Oliver** and **C. P. Putnam,** (Harvard Medical School); **Prof. Gawne,** (Cleveland Medical College); and several hundred others whose testimonial letters are on file in our office.

PRICE, 75 Cents per bottle. Trial Size, 40 Cents.

[Unguentum Petrolei]

SAMPLES FURNISHED ON APPLICATION.

THE POST-OFFICE LAWS

Forbid anything of an oleaginous nature being sent through the mail.

THEOPHILUS REDWOOD, Ph.D., F. C. S., Professor of Chemistry and Pharmacy to the Pharmaceutical Society of Great Britain, says, in reference to this preparation:—

"UNGUENTUM PETROLEI appears to be obtained from crude Petroleum by fractional distillation and subsequent purification. Products of a similar description have been introduced in pharmacy, and recommended as substitutes for animal or vegetable fats in the preparation of ointments or liniments.

"Among these the UNGUENTUM PETROLEI is distinguished by its having a firmer consistence and a higher melting point, and in these respects it resembles pure lard, from which it differs in that it is entirely free from liability to become rancid or to undergo any chemical change. It has an amber color, and a smooth, jelly-like appearance and is almost wholly free from odor or taste. It is free from, and insoluble in, water. It is very slightly soluble in rectified spirit, but very soluble in ether, in fixed oils and fats. I am of opinion that its characters and properties are such as to render it a valuable adjunct to our Materia Medica."

Dr. TILBURY FOX, London, writes:—"I like the UNGUENTUM PETROLEI very much indeed, and shall not fail to prescribe it."

From "THE LANCET," London, October 20th, 1878.—"Semi-transparent, pale yellow in color, and perfectly free from offensive smell. We consider it a valuable preparation, and hope its use will become as common in England as it is said to be in America."

From "THE MEDICAL TIMES AND GAZETTE," London, October 20th, 1878.—"The substance introduced under the name of UNGUENTUM PETROLEI is of about the consistence of good lard, has no smell, keeps any length of time, apparently without becoming rancid, and may be exposed to any kind of atmosphere without undergoing chemical change. It has long been, we understand, in use in America, where it enjoys a wide-spread popularity; and it will, we doubt not, come into extensive use here also, as a vehicle for making ointments, as a demulcent in various diseases of the skin, and as a lubricant."

UNIVERSITY of MICHIGAN.

DEPARTMENT OF MEDICINE AND SURGERY.

The 30th annual course of lectures will commence on October 1st, 1879, and continue *nine months*.

Course separate, but equal, for women.

Matriculation Fee, *paid but once*—Residents of Michigan, $10; non-residents, $25. Annual Dues—Residents of Michigan, $20; non-residents, $25. Graduation Fee—for all alike, $10.

FACULTY.

James B. Angell, LL. D., President. Alonzo B. Palmer, M.D., Professor of Pathology and the Practice of Medicine, Corydon L. Ford, M.D., Prof. of Anatomy and Physiology. Albert B. Prescott, M.D., Professor of Organic and applied Chemistry and Pharmacy. George E. Frothingham, M.D., Professor of Materia Medica, Ophthalmology and Otology. Donald Maclean, M.D., Professor of Surgery. Edward S. Dunster, M.D., Professor of Obstetrics and Diseases of Women and Children. John W. Langley, M.D., Professor of General Chemistry and Physics. Will. J. Herdman, M.D., Demonstrator of Anatomy. Charles H. Stowell, M.D., Instructor in Physiological Laboratory. Victor C. Vaughan, PH.D., Instructor in Medical Chemistry.

Send for Circular and Catalogue.

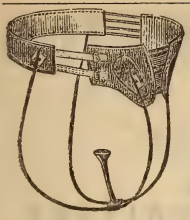
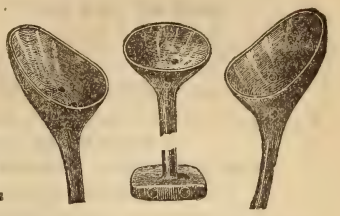
1133-1184



DR. McINTOSH'S

Natural

UTERINE SUPPORTER.



No instrument has ever been placed before the medical profession which has given such universal satisfaction. The combination is such that the Physician is able to meet every indication of Uterine Displacements, Falling Womb, Anteversion, Retroversion and Flexions are overcome by this instrument, where others fail; this is proven by the fact that since its introduction to the Profession it has come into more general use than all other instruments combined.

Among the many reasons which recommend this Supporter to the Physician is its self-adjusting qualities. The Physician after applying it need have no fear that he will be called in haste to remove or readjust it, as is often the case with rings and various pessaries held in position by pressure against the vaginal wall, as the patient can remove it at will and replace it without assistance.

The Abdominal Supporter is a broad morocco leather belt, with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen. The Uterine Support is a cup and stem made of highly polished hard rubber, very light and durable, shaped to fit the neck of the womb, with openings for the secretions to pass out; as shown by the cuts. Cups are made with extended lips, to correct flexions and versions of the womb.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, passing down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic adapt themselves to all the varying positions of the body, and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Anteversion, Retroversions, or any Flexions of the Womb, and is used by the leading Physicians with never failing success, even in the most difficult cases.

Price—to Physicians, $8.00; to Patients, $12.00

Instruments sent by mail, at our risk, on receipt of price with 16 cents added for postage, or by Express, C. O. D.

MIAMI MEDICAL COLLEGE OF CINCINNATI.

Member of the American Medical College Association.

FACULTY.

JOHN A. MURPHY, M.D., Professor of Principles and Practice of Medicine and Clinical Medicine.
WM. H. MUSSEY, M.D., Professor of Operative and Clinical Surgery and Surgical Diseases of Women.
E. WILLIAMS, M.D., Professor of Ophthalmology, Aural Surgery and Clinical Ophthalmology.
WM. CLENDENIN, M.D., Professor of Descriptive and Surgical Anatomy.
WM. H. TAYLOR, M.D., Professor of Obstetrics and Clinical Midwifery.
THOMAS H. KEARNEY, M.D., Professor of Principles of Surgery, Surgical Diseases and Clinical Surgery.
J. C. MACKENZIE, M.D., Professor of Physiology and Pathology and Clinical Medicine.
J. F. JUDGE, M.D., Lecturer on Chemistry and Toxicology.
WM. B. DAVIS, M.D., Professor of Materia Medica and Therapeutics.
BYRON STANTON, M.D., Professor of Diseases of Women and Children and Clinical Gnyæcology.
WM. H. DE WITT, M.D., Lecturer on Mental Diseases.
B. P. GOODE, M.D., Lecturer on Diseases of Children.
ROBT. SATTLER, M.D., Lecturer on Diseases of the Eye and Ear.
A. D. BENDER, M.D., Lecturer on Laryngoscopy and Diseases of the Throat, and Demonstrator of Anatomy.
C. A. LE BOUTILLIER, M.D., Lecturer on Surgical Dressings.
CHAS. W. MATHERS, M.D., Demonstrator of Anatomy.
WM. L. DUDLEY, Demonstrator of Chemistry.

THE PRELIMINARY TERM of Lectures will begin September 3d, 1879, and continue one month. This Course will be one of *unusual interest and importance* to physicians as well as students.

THE REGULAR WINTER SESSION will begin October 1st, 1879, and continue five months. This course will consist of Didactic Lectures with Demonstrations, Recitations, Clinical and Special Instruction, involving Physical Manipulations. From five to six Didactic Lectures and Demonstrations are delivered daily, covering the general topics of Medicine and Surgery as taught in all regular medical colleges.

CLINICS.—The Faculty confidently announce that students have, in this college, unsurpassed clinical advantages. *Four Special Clinics* are held daily, in the college building (at which more than six thousand patients are examined annually), viz.: In Practice, Surgery, Gynæcology, Diseases of Children, Ophthalmology and Larnygology, in all of which advanced students have opportunities to make full examinations, especially in *Thoracic Diseases* and *Gynæcology*, and frequently to witness *Obstetric* cases. These clinics are free to students of the college. Two clinical lectures are delivered daily at the Cincinnati Hospital (near the college), during the entire college session.

The College also affords the fullest advantages in *Practical Chemistry*, *Practical Anatomy*, *Practical Physiology* and *Microscopy*.

FEES.

Matriculation fee (annually)	$ 5 00	Demonstrator's Ticket	$5 00
Regular Lecture Term	75 00	Hospital Ticket	5 00
Graduation Fee	25 00	Alumni of this institution free.	

JOHN A. MURPHY, M.D., Dean, 163 *West Seventh Street.*
WM. H. TAYLOR, M.D., Secretary, 329 *West Seventh Street.*

1160–1185

NOW READY.

LESSONS IN GYNECOLOGY.

BY WM. GOODELL, A.M., M.D.,

Professor of Clinical Gynecology in the University of Pennsylvania.

With Numerous Illustrations

1 Vol., 8vo. Price, Cloth, $3.00.

This entirely new and complete work by this distinguished author cannot fail to prove a valuable addition to gynecological literature. The following table of contents will indicate its scope:—

Lesson	I.	Gynecological Instruments.
"	II.	Caruncle, and other Affections of the Female Urethra.
"	III.	Vesical Diseases of Women.
"	IV.	Fistulæ of the Female Genital Organs.
"	V.	Closure of the Vulva for Incurable Vesico-vaginal Fistulæ—Tumors of the Vulva.
"	VI.	On the Causes, Prevention, and the Cure of Lacerations of the Female Perineum; the Primary Operation.
"	VII.	Secondary Operation for Laceration of the Female Perineum.
"	VIII.	Local and Constitutional Treatment for Chronic Metritis and Endometritis.
"	IX.	Retroversions and Retroflexions of the Womb.
"	X.	Anteversions and Anteflexions of the Womb.
"	XI.	Dilatation of Cervical Canal; Rapid Dilatation; Tents.
"	XII.	On the Use of the Closed Lever Pessary, and of the Intra-uterine Stem Pessary.
"	XIII.	Different Kinds of Pessaries; Abdominal Supporters.
"	XIV.	Prolapse of the Womb; Prolapse from Simple Descent; Prolapse from Hypertrophic Elongation of the Infra-vaginal portion of Cervix.
"	XV.	Prolapse of the Womb from Hypertrophic Elongation of the Supra-vaginal Portion of the Cervix.
"	XVI.	Laceration of the Cervix Uteri.
"	XVII.	Cancer of the Womb.
"	XVIII.	Vegetations of the Endometrium.
"	XIX.	Polypus of the Womb.
"	XX.	Fibroid Tumors of the Womb.
"	XXI.	Treatment of Fibroid Tumors of the Womb.
"	XXII.	Spaying for Fibroid Tumors, and for other Diseases of the Womb.
"	XXIII.	Ovarian Cyst; its Diagnosis, and its Treatment by Tapping, by injections of Iodine, and by Drainage.
"	XXIV.	Ovariotomy by Abdominal Section.
"	XXV.	Vaginal Ovariotomy.
"	XXVI.	Nerve-tire and Womb-ills, or the Relation which the Nerves bear to the Diseases of Women.
"	XXVII.	The Prevention of Uterine Disorders.
"	XXVIII.	The Sexual Relations as Causes of Uterine Disorders.

These subjects are presented in a novel and attractive literary form, from the riches of an uncommonly wide clinical experience. Dr GOODELL'S operative procedures are generally marked by strong originality and much ingenuity; while his therapeutical plans are the result of very carefully studied observation. As a lecturer and teacher he is well-known to all students of his specialty, and the present volume is the only one he has published on the subject, and therefore the only source from which to derive a knowledge of his methods.

UNIVERSITY of the STATE OF NEW YORK.

AMERICAN

VETERINARY COLLEGE,

No. 141 West 54th Street,

NEW YORK.

INCORPORATED 1875.

FACULTY.

A. LIAUTARD, M.D., V. S.,
Prof. Comparative Anatomy, Operative Surgery, Sanitary Medicine, Clinical Medicine.

A. LARGE, M. D., M.R.C.V.S.L.
Prof. of Theory and Practice of Veterinary Medicine and of Clinical Medicine.

A. W. STEIN, M.D.,
Prof. of Histology and Comparative Physiology.

S. R. PERCY, M.D.,
Prof. of Chemistry, Materia Medica and Therapeutics.

J. L. ROBERTSON, M.D., V. S.,
Prof. of Cattle Pathology, Obstetrics and Clinical Medicine.

A. A. HOLCOMBE, D.V.S.,
Adjunct Professor of Surgery,

FRED. A. LYONS, M.D.,
Adjunct Prof. of Chemistry, Materia Medica and Therapeutics.

W. J. COATES, D.V.S.,
Lecturer on Histology and Demonstrator of Anatomy.

T. B. ROGERS, D.V.S.,
Lecturer on Pharmacology.

R. A. McLEAN, D.V.S.,
Lecturer on Anatomy.

The College has been established for the purpose of qualifying men for the practice of the Veterinary specialty of Medicine.

The system of instruction embraces a thorough Didactic and Clinical Course, the Clinical instruction being illustrated by the free clinics held at the American Veterinary Hospital (branch of the College).

The regular term opens in the beginning of October, and closes at the latter end of February.

SESSIONS OF 1879-'80

FACULTY.

JAMES F. NOYES, M.D.,
Emeritus Professor of Ophthalmology and Otology.

THEO. A. McGRAW, M.D., President,
Professor of Principles and Practice of Surgery and Clinical Surgery.

GEORGE P. ANDREWS, M.D.,
Professor of Principles and Practice of Medicine and Clinical Medicine.

C. B. GILBERT, M.D.,
Professor of Obstetrics, and Diseases of Women and Children.

N. W. WEBBER, M.D.,
Professor of General and Descriptive Anatomy, and Clinical Surgery.

SAMUEL P. DUFFIELD, PH.D., M.D.,
Professor of Toxicology and Medical Jurisprudence.

ALBERT B. LYONS, M.D.,
Professor of Chemistry and Director of the Chemical Laboratory.

LEARTUS CONNOR, M.D., Secretary,
Professor of Physiology and Diseases of the Eye and Ear.

H. O. WALKER, M.D.,
Lecturer on Anatomy and Genito-Urinary Diseases.

E. L. SHURLY, M.D.,
Lecturer on Materia Medica, Therapeutics and Clinical Laryngology.

HAL. C. WYMAN, M.D.,
Lecturer on Physiology.

J. G. JOHNSON, M.D.,
Lecturer on Diseases of Mind and Nervous System.

J. H. CARSTENS, M.D.,
Lecturer on Clinical Medicine.

F. A. SPALDING, M.D.,
Lecturer on Diseases of the Skin.

C. C. YEMANS, M.D.,
Lecturer on Chemistry.

E. A. CHAPOTON, M.D.,
Demonstrator of Practical Physiology and Instructor in Anatomy and Surgery.

J. W. ROBERTSON, M.D.,
Demonstrator of Practical Microscopy.

DAVID INGLIS, M.D.,
Instructor in Chemistry and Physiology.

E. B. WARD, M.D.,
Curator of Museum and Librarian.

The Collegiate Year is divided into three sessions.

Preliminary Session opens Wednesday, September 3d, 1879, and closes September 30th. The Clinics are held and the Lectures delivered by the Professors of the regular Faculty, and in the same order and frequency as during the Winter Term. Opportunity is given to dissect or work in the Chemical and Physiological Laboratories.

The Regular Session opens Wednesday, October 1st, 1879, and closes March 2d, 1880. During this term all the branches of *General Medicine* and *Surgery*, both scientific and practical, are taught with care and thoroughness. All students are daily examined on the subjects of the lectures and on their dissecting and laboratory work.

Senior students have *daily practice* in the *art of examining patients*, in forming their own diagnosis, prognosis and treatment. As this is done under the direction of the professor holding each clinic, and in the presence of the class, it constitutes an invaluable course of training.

The Recitation Session begins March 10th, 1880, and closes June 23d, 1880. Daily during this term will be held recitations for both Seniors and Juniors, and one or two clinics and a lecture.

The recitations will embrace a thorough drill upon the general subjects of the Regular Session, viz.: Anatomy, Chemistry, Physiology, Practice of Medicine, Materia Medica and Therapeutics, Surgery, Obstetrics, Diseases of Women and Children.

Though the Recitation and Preliminary Sessions are optional, it is hoped that all who can will avail themselves of their manifest advantages in commencing the study of medicine, or in supplementing the regular winter course.

Three Hospitals—Harper's, St. Mary's and St. Luke's—with two large free dispensaries, afford an abundance of clinical material for illustrative and practical teaching.

All lectures are delivered on Hospital grounds. The *peculiar feature* of this school is the *intimate union* between its *laboratory*, *clinical* and *didactic* instruction.

Fees.—For Preliminary and Regular Sessions: Matriculation, $5. Hospital Fees, $10. Lecture Fees, $40. Graduation, $25. Lecture Fees to third course students, $25.

For the Recitation Term the Lecture Fees are $10, to those who attend the other courses. All others are required to matriculate and take out the Hospital tickets.

All fees payable in advance to the *Secretary*.

Announcement and Catalogue, or any further information which may be desired, can be promptly obtained by addressing

LEARTUS CONNOR, M.D., Secretary,

1165-1190 **92 Cass Street, Detroit.**

SPECIAL FACTS CONCERNING

BELLADONNA PLASTER

IN RUBBER COMBINATION.

PREPARED BY

SEABURY & JOHNSON.

In undertaking the manufacture of Medicinal Plasters we had but one object in view—THE IMPROVEMENT OF ALL KINDS OF PLASTERS. Among the various plasters manufactured by us was BELLADONNA PLASTER. This article met with a larger demand than some of the others, acquired a reputation among the best druggists, and received the confidence of the profession. Its large sale interfered with rival manufacturers, and continuous efforts have been made on their part to prejudice physicians against it.

As these attacks have been of late more malicious than usual, we have deemed it advisable, in self-defence, and in order to place our article fairly before the practitioner, to assign reasons why we consider it the most thoroughly reliable preparation ever offered the medical profession. First, it is a combination of the Alcoholic Extract of Belladonna only, with purified rubber, and thus possesses all of the advantages of the rubber base, being pliable, convenient of application, and not subject to the deteriorating influence of age, as is the case when any other base is used. Secondly, it is freed from all irritative properties. Thirdly, it is more adhesive than any other plasters. Fourthly, we believe it to be as perfect, in every respect, as it is possible to make a Belladonna plaster.

ENGLISH EXTRACTS—WHY WE DO NOT EMPLOY THEM.

Imported English Extracts are prepared from the Inspissated Juice of the leaf, while our pharmacopœia formula is treated by Alcohol. The active principle of Belladonna (Atropia) is only partially obtained by Inspissation. The employment of Alcoholic or Hydro-Alcoholic Solvents completely exhausts the entire strength of the drug.

The value of both preparations is clearly presented in an able treatise published in the *American Journal of Pharmacy*, April 1876, page 145. Our own investigations are substantially identical :—

TABLE OF RESULTS,

	Test solution requisite for 100 cc. of Ext. Solution.	Percentage of Atropia in Extract.
EXT. BELLADONNÆ ALCOH. U. S. P.	17·732	2·571
GEO. ALLEN & CO., English	9·73	1·411
HERRINGS & CO., "	8·133	1·179
E. MERCK, Germany (aqueous extract), made 1869	1·9	·275

This analysis clearly establishes the fact that the **Alcoholic Extract of Belladonna of the U. S. P. averages over twice the strength of English Extracts,** and should, therefore, be preferred in all cases where a reliable article is desired. Inspissated and Aqueous Extracts deteriorate, while Alcoholic remain stable.

Therefore the assumption of pretentious manufacturers, that the English Extracts are the superior preparations, must be based on a former supposition rather than present facts. The following analysis substantiates our claim regarding English Extracts.

ANALYSIS OF BELLADONNA PLASTERS, BY PROF. R. OGDEN DOREMUS.

"BELLEVUE HOSPITAL COLLEGE, New York, Sept. 7, 1878.

"GENTLEMEN—I obtained from Messrs W. H. Schieffelin & Co., of this city, samples of Belladonna Plasters prepared by Grosvenor & Richards, Boston ; Mitchell Novelty Plaster Works ; Seabury & Johnson, New York and London. I have examined these varieties for the purpose of determining which possesses the largest quantity of Atropine. I employed equal surfaces of each, and *my analysis demonstrated that* SEABURY & JOHNSON'S *contains the greatest proportion* of the active principle of Belladonna. "R. OGDEN DOREMUS, M.D., L.L.D."

Belladonna Plaster, prepared by Seabury & Johnson, is packed in elegant tin cases, which contain 1 yard each, and can be obtained of almost any druggist throughout the United States and Canada, or will be furnished direct by mail. Samples sent on application.

BETHESDA WATER.

BELLEVUE, PA., May 21st, 1879.

W. B. HYATT, M.D.,

Marshallville, Wayne Co., Ohio.

DEAR SIR:—Your letter received this morning. Am sorry my friend Dr. S. did not think to tell you to address me at Pittsburg, and your communication would have reached me in a few hours instead of days, as I seldom call at the village P. O.

You will address your orders for BETHESDA WATER to JOSEPH FLEMING, 84 Market Street, Pittsburg, Pa., and they will receive prompt attention. I say this on account of my business acquaintance with Mr. Fleming. I will call on him in the morning, and have him send you pamphlets and any information relative to the matter he may think required.

If my testimony regarding the efficacy of Bethesda Water was required, I could cite several cases of my own personal knowledge. I am convinced that it is a specific in diseases arising from a morbid condition of the kidneys, providing, of course, that the disease has not reached a point beyond the possibility of recovery, as in the case of my late brother, and even then no figures could estimate its value in giving relief from suffering. I have a friend who was under treatment of different physicians all last fall and winter, and apparently getting worse: I persuaded him to stop the treatment and use the "water," and before he had used ten (10) gallons he was much better, and now nearly if not quite well. The doctors would diagnose Phlebitis, but there was a low specific gravity of the urine and other indications of kidney or dropsical affection, which satisfied me that he needed the effects of the "water;" and the results are as stated, and the inflamed vein is getting well, as well as general improved health. It occurs to me, the duty of physicians to investigate such things, and if they contain medicinal virtues, to make it known to suffering humanity instead of standing aloof until men in other walks of life have long recognized and demanded its use. Of course, there are so many new remedies claimed that are worthless, that there is some excuse, yet this Bethesda Water has been in use more than ten (10) years, and comparatively few physicians appear to know anything about its properties. Although you are a stranger to me, allow me to commend you, or any worthy physician who is willing to investigate and test its claimed virtues, and if found, to disseminate the knowledge among their less fortunate fellows. Yours, truly,

W. J. THOMPSON.

P. S.—If you have occasion to address me further, send your letter to Auditor's Office, P. A. R. R., Pittsburg, Pa.

Sunnyside Medical Retreat

For Mental and Nervous Diseases, Inebriety and the Opium Habit,

FORT WASHINGTON, NEW YORK CITY.

This home, situated on the banks of the Hudson, under the management of Dr. Edward C. Mann, late Medical Superintendent of the New York State Emigrant Insane Asylum, receives cases of either sex affected with mental disorders, Inebriety or the Opium habit. The beauty of location and surroundings, handsomely furnished apartments, and the attentions and comforts of home life, all combine to make Sunnyside an attractive and popular private retreat. Applications may be made to Dr. Mann, either by mail or personally, at Fort Washington. Twelve trains daily from Hudson River Depot, 30th St., and 10th Ave. Broadway and 23d St. line of stages run direct to depot. The profession respectfully invited to call, and cordially welcomed. 1152-1y

WOMAN'S HOSPITAL MEDICAL COLLEGE

337 and 339 S. Lincoln St., Chicago.

The *Tenth Annual Course of Lectures* will commence the first Tuesday in October, 1879, and continue twenty-one weeks. The Spring Term will commence April 1st, and continue twelve weeks. College building new. Clinical and Dissecting advantages unsurpassed.

FACULTY.—William H. Byford, A.M., M.D., President, Obstetrics; T. Davis Fitch, M.D., Gynecology; Chas. Warrington Earle, M.D., Treasurer, Diseases of Children; Isaac N. Danforth, M.D., Pathology; John E. Owens, M.D., Surgery; Henry M. Lyman, A.M., M.D., Practice of Medicine, Daniel R. Brower, M.D., Secretary, Nervous and Mental Diseases; Sarah Hackett Stevenson, M.D., Corresponding Secretary, Physiology; David W. Graham, A.M., M.D., Anatomy; Plymouth S. Hayes, M.D., Chemistry; Wm. J. Maynard, A.M., M.D., Therapeutics and Dermatology; Wm. T. Montgomery, M.D., Eye and Ear; E. Fletcher Ingals, M.D., Diseases of Chest and Throat; John O. Hobbs, M.D., Demonstrator.

For information or announcement, address either of the Secretaries, at 125 State Street.

A NEW FORM OF MEDICATION,

COMBINING

Reliability and Accuracy for the Physician,
Convenience and Elegance for the Pharmacist.

Saccharated Extracts.

THE DRY, SOLUBLE, EXTRACTIVE MATTER OF THE DRUG IS TRITURATED WITH MILK SUGAR IN SUCH PROPORTION THAT ONE TROY OUNCE OF THESE EXTRACTS REPRESENTS ONE TROY OUNCE OF THE DRUG.

A Soluble Drug of Uniform Strength and Quality.

The **percentage of Dry Extract** is in all cases **indicated** on the label.

In the more **powerful remedies** the **percentage** of **alkaloid** is also indicated.

The advantages of the **Saccharated Extracts** over ordinary extracts are:—

1. They are stable at all temperatures and under all conditions; they will not swell, ferment, or waste.
2. They are always of a uniform and convenient consistency, not becoming solid, as is the case with ordinary powdered extracts.
3. Their division is rapidly effected, and with great convenience.
4. Their invariability in strength renders them capable of being prescribed with precision.
5. Their general application to any form of medication, as Capsules, Compressed Pills, Troches, etc.

Office, 87 Clark St., Chicago.

DR. L. D. McINTOSH'S
Electric or Galvanic Belt.

If this new combination could be seen and tested by the medical profession, few, if any, words would be needed from us in its favor, for it combines utility with simplicity in such perfection that seeing it is convincing proof of its great value. The medical profession to-day acknowledge, almost universally, Electro-Therapeutics.

This combination is composed of sixteen cells, placed in pockets on a belt. Each cell is made of hard vulcanized rubber, lined with a copper cell, which constitutes the negative plate. The rubber coating perfectly insulates each cell. The positive plates are of zinc, wrapped in a porous material, to absorb the exciting fluid and prevent contact with the copper, and permit the current to pass from the copper to the zinc.

Thus the cells are charged without wetting the belt, and the discomfort following to the patient. A wire is soldered to each zinc plate, which connects with the copper cell by entering a tube on its side, thus rendering the belt pliable.

The McIntosh Electric Belt is superior to all others for the following reasons:—

It is composed of sixteen cells—thus giving a powerful current. A current selector is so arranged that one or more cells can be used at pleasure. There is not anything irritating about the Belt, as is the case with all other contrivances where the metal used is wet with weak acids and placed next to the skin. The electrodes are pieces of metal covered similar to ordinary battery electrodes, and connected with the cells by connecting cords. By this arrangement, a current from the Belt can be applied, to produce a general or local effect.

Physicians who have used this belt in their practice do not hesitate to recommend it to the profession.

Our pamphlet on Medical Electricity sent free on application. Address

McINTOSH GALVANIC BELT AND BATTERY CO.,

HORSFORD'S
Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

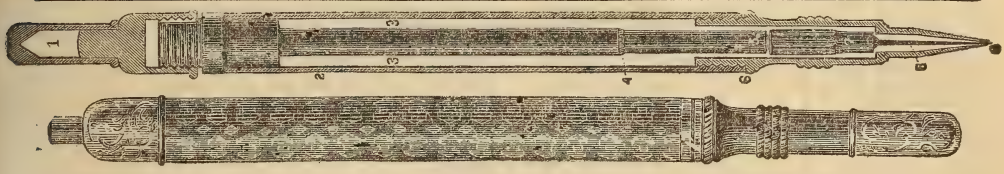
Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges.

MANUFACTURED BY THE

RUMFORD CHEMICAL WORKS,

1155-1206 PROVIDENCE, R. I.



THE MACKINNON PEN.

Will write 75 pages foolscap without refilling; abolishes steel or gold pens, pen holders, pencils and inkstands. Writes on any paper, with any clean ink. "The point of the pen is actually a ring of iridium," says the report of the Franklin Institute. Can be carried in the pocket or used at the desk. "Warranted to show no signs of wear in three years." No professional man should be without it. Examine it, at

H. VAN ALLEN, Agent. BORHEK'S,

LONG ISLAND COLLEGE HOSPITAL, BROOKLYN, NEW YORK.

ANNUAL ANNOUNCEMENT, 1878-79.

THE READING AND RECITATION TERM will commence October 1, 1878, and close at the beginning of the Regular Term. THE REGULAR TERM will open February 1, 1879, and continue five months.

SAMUEL G. ARMOR, M.D., LL.D.,
Professor of the Practice of Medicine, and Dean.

GEORGE W. PLYMPTON, A.M.,
Professor of Chemistry.

JOSEPH H. RAYMOND, M.D.,
Professor of Physiology.

DANIEL AYRES, M.D., LL.D.,
Emeritus Professor of Surgery.

ALEXANDER J. C. SKENE, M.D.,
Professor of Diseases of Women and Children.

EDWARD SEAMAN BUNKER, M.D.,
Professor of Obstetrics.

CORYDON L. FORD, M.D.,
Professor of Anatomy.

JARVIS S. WIGHT, M.D.,
Professor of Surgery, and Registrar.

JOHN D. RUSHMORE, M.D.,
Professor of Materia Medica.

THE CLINICAL ADVANTAGES OF THE LONG ISLAND COLLEGE HOSPITAL ARE UNSURPASSED IN THIS COUNTRY.

For Circulars, address DEAN or REGISTRAR. 1122-1178

Dextro-Quinine in Intermittent Fever.

Case.	Name and Sex of Patient.	Age, etc.	Number of Paroxysms before taking.	Number of Paroxysms after.	Dose and Mode of Exhibition.	Total amount Exhibited.	Remarks, Pathological and Physiological Phenomena, etc.	Reported by
1 2	J. S. S. D. V. W.	27 14	14 5	0 0	10 grs. at bedtime. 8 grs. at bedtime.	30 grs. 24 grs.	I have found Dextro-Quinine fully equal to the Sulphate of Quinia, with almost none of the disagreeable symptoms of the latter.	F. C. Hageman, M.D., Seaford, L.I.
3	Emma L.	16	60 or more.	0	5 grs. every three hours, in glycerine, without intermission, only during febrile exacerbations, etc.	30 grs.	Patient was very much prostrated with typho-malarial fever; been under the care of another physician; was called in on the third week. I then prescribed 5 grs. of Dextro-Quinine every three hours, in glycerine, when, as it were by magic, all the grave symptoms abated at once, and the patient made a rapid recovery.	Alex. F. Joseph, M.D., Napoleon, Ind.
21	Mrs. S., *Double Quotidian.* Had taken large doses Cinchonidia sulphate without effect.	22 Brunette. Married. No children.	6	0	20 grs. divided into chart. No. v, one every two hours.	20 grs.	Had first paroxysm Nov. 20, 6 A.M., again at 4 P.M. Presented Cinchonidia sulphate, grs. xxx, chart. No. v. One to be taken every two hours. Nov. 21. Return of paroxysm at 6 A.M. and 4 P.M. Gave Cinchonidia sulphate, grs. xlv, chart. No. v. One to be taken every two hours. Nov. 22. Return of paroxysm at same time as on preceding days. Prescribed Dextro-Quinine, grs. xx, chart. No. v. One to be taken every two hours. No return of chill since that date, and highly pleased with my experience.	N. H. Manring, M.D., Rigdon, Ind.
15	I. de L., female. *Tertian.* Habituated to Quinia.	19 Married.	2	0	15 grs. in 3 doses of 5 grs., taken at intervals of ½ hour, commencing four hours before expected paroxysm. Taken in capsule.	15 grs.	Dilatation of pupil; tinnitus aurium severe, but not so much so as on former occasions when Sulphate of Quinia was used. Directed her to take 10 grains on the third day, but she did not do so. Twelve days have elapsed without return of chills. Is taking citrate of iron and strychnia.	
16	Jennie S., colored. *Quotidian.* Has "used Quinine and everything else," as she herself expressed it.	25 Married.	Unknown, but a very large number.	1	16 grs. in 4 doses, in capsule, with 1-16 gr. Morph. acet., to be taken at ½ hour intervals, commencing four hours before expected paroxysm.	48 grs.	On first evening after exhibition of Dextro-Quinine had a very slight ague, followed by considerable fever, which, however, soon passed off. Gave Hydrarg. Chlor. Mite, grs. x, at bedtime, which caused three or four operations of the bowels. The Dextro-Quinine was continued the next day. *Missed chill for first time in over a month.* Thought it best to continue medicine (without Morphia) another day. Has had no return up to to-day (10 days). Did not complain of tinnitus.	Frank S. James, Ph.D., M.D., Osceola, Ark.
5	Mary B.	3½	3	0	1 gr., in solution, every three hours.	16 grs.	Commenced the Dextro-Quinine just after last paroxysm; it acted excellently. It is now more than four weeks since she took the remedy; there has been no return. She is now in the enjoyment of good health.	G. H. Berry, M.D., New York City.
6	Edward Libby. *Tertian.*	24	9 or 10	0	Two 12-grain doses at half-hour intervals.	24 grs.	Had been taking Sulphate of Quinia in 5-gr. doses for some time, with little or no effect. Has had no chill since the Dextro-Quinine was administered (more than a month having elapsed), and the result is entirely satisfactory.	H. A. Weymouth, M.D., Saco, Me.
11	Mary Cavanough. *Quotidian.*	3	One a day for six months.	0	2 grs. in powder, every two to three hours.	15 grs.	Little girl had been complaining with chills and fever for over six months; had used Sulphate of Quinia, Tincture Cinchona, Cincho-Quinine, etc. *Had taken great quantities of Sulphate of Quinia, without effecting a cure. I gave in all about 15 grs. of Dextro-Quinine, and she never has had any chill since.* This one case in particular I think a remarkable one. The little girl had had chills regularly, almost every day, for over six months, had been treated by two physicians, and a cure could not be effected, as they and the family thought, under any circumstances. I was called directly after, and gave 2 grs. *Dextro-Quinine*, in powder, every two to three hours, and to my great surprise, as well as every one else's, she failed to have any more chills. I then put her on a tonic of iron, and she is now enjoying good health. I consider the Dextro-Quinine far superior to any of the preparations of Quinine, and, from what I have seen of its medicinal effects, I do not hesitate to recommend it as superior to all other remedies in Remittent and Intermittent Fevers.	J. H. Struble, M.D., Stanhope, N. J.

DEXTRO-QUININE sent by mail, at the rate of $1.60 per ounce, to Physicians who cannot be supplied by their local Druggists. Address

KEASBEY & MATTISON, Philadelphia.

In corresponding with Advertisers please mention THE MEDICAL AND SURGICAL REPORTER.

BE CAREFUL TO SPECIFY McKESSON & ROBBINS'.

SPECIFY McKESSON & ROBBINS' Oval Shape, Complete Coating.

IMPORTANT TO PHYSICIANS!

The fact that Sulphate of Quinine is only soluble in over 700 parts of water is not generally known, or if known is not usually considered, except in prescriptions, when this difficulty is overcome by the addition of Acid; and the further fact that **Bi-Sulphate of Quinine** is soluble in **only 10 parts of water** is as little appreciated.

McKesson & Robbins have paid much attention to the subject of putting Quinine into Pills, in a condition approaching that of a solution, and have at last succeeded in their **BI-SULPHATE OF QUININE PILLS,** and offer the same to the profession, confident that they will stand any test for solubility and prompt action. Physicians will please always specify **McK. & R. Bi-Sulph. Quinine Pills,** and they will not be disappointed in results.

Note.--With no reference to *respectable* druggists, we would say that cases have come to our knowledge and have been noted, where other pills have been substituted on prescriptions for ours.

POWDERED PURIFIED CHINOIDINE.

Containing all the Non-Crystalizable Alkaloids of Cinchona Bark.

Similar preparations have been lately offered in market AT HIGH PRICES under different fancy appellations, and claims made for the same as of equal efficiency with Quinine.

As a great demand exists for a cheap anti-malarial remedy, we introduce this preparation at low figures; and, in order that the profession may judge practically of its merits, will forward a sample to any physician's address, or mail one ounce upon receipt of FIFTY CENTS.

Yours respectfully,

McKESSON & ROBBINS,

Wholesale Druggists and Manufacturing Chemists,

91 FULTON ST., NEW YORK.

GRANULATED EFFERVESCENT SALTS

PREPARED BY

WILLIAM R. WARNER & CO.,

CHEMISTS,

PHILADELPHIA.

Granulated Effervescent

VICHY SALT.

(Grand Grille.)

A large teaspoonful dissolved in half a glass of water, forms a grateful and refreshing draught, identical with the natural water. Per dozen, $4.00

Granulated Effervescent

SELTZER SALT.

A tablespoonful to half a glass of water forms a grateful and refreshing saline draught, identical with the natural water. Per Dozen, $4.00

Granulated Effervescent

SEIDLITZ MIXTURE.

(Seidlitz Powder, U. S. P.)

An excellent aperient and refrigerant, very acceptable to the stomach. Per doz. $4.00

DOSE.—One tablespoonful in a glass of water.

Granulated Effervescent

NITRATE of POTASSIUM.

A dessert-spoonful in glass of water makes an excellent mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

CITRATE OF POTASSIUM.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $5.00

Granulated Effervescent

Bi-Carbonate of Potassium.

A dessert-spoonful in glass of water makes an excellent neutral mixture and effervescing draught. The diaphoretic and refrigerant effects are readily produced. Per dozen, $4.00

Granulated Effervescent

Pepsin, Bismuth and Strychnia.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin, soluble Citrate of Bismuth, and the sixtieth grain of Citrate of Strychnia. Per dozen, $10.00

Granulated Effervescent

PEPSIN AND BISMUTH.

Each drachm or heaping teaspoonful contains the dose of Saccharated Pepsin and soluble Citrate of Bismuth. Per doz. $9.00

Granulated Effervescent

CITRATE OF MAGNESIA.

(Pleasant and Efficient.)

For a purgative effect, take two or more tablespoonfuls added to a small glass of water, and drink while effervescing. As a laxative, one or more tablespoonfuls taken in the same manner. One or two teaspoonfuls in sweetened water, produces a delightful, cooling drink in summer. Per dozen, $4.00

Granulated Effervescent

CITRATE LITHIA.

Each drachm or teaspoonful contains four grains of the chemically pure salt. Valuable in Rheumatic, Gouty and Analogous disorders. Per dozen, $10.00

Granulated Effervescent

KISSINGEN SALT.

A large teaspoonful dissolved in half a glass of water, forms an agreeable and refreshing draught identical with the natural water. Per dozen, $4.00

Granulated Effervescent

CRAB ORCHARD SALT.

Prepared from the exact analysis of the purified natural salt, obtained from the Crab Orchard Spring, Ky.

A tablespoonful in half a glass of water forms a grateful effervescing draught, producing the effect of the natural water. Per dozen, $4.00

Granulated Effervescent

OXALATE OF CERIUM.

Each drachm or large teaspoonful contains two grains of Oxalate of Cerium. Per dozen, $5.00

Granulated Effervescent

CITRATE CAFFEINE.

A dessert-spoonful containing one grain of Citrate of Caffeine should be given for sick headache, every hour or two before and during the paroxysms. Per dozen, $10.00

Physicians will please specify Warner & Co.—Equal to best English.

FOOD IS THE BEST TONIC!!

MENSMAN'S

PEPTONIZED

BEEF TONIC.

The great necessity for a fluid food that would possess *all the elements necessary for the support of the system,* having been long felt by the medical profession, we call attention to this preparation, containing the entire nutritious properties of the muscular fibre, blood, bone, and brain of a healthy bullock, dissolved and semi-digested by aid of heat and pepsin, and preserved by spirit; thus constituting a most perfect nutritive, reconstructive tonic.

It is not a mere stimulant, like the now fashionable extracts of beef, but contains blood-making, force-generating, and life-sustaining properties, pre-eminently calculated to support the system under the exhausting and wasting process of fevers and other acute diseases, and to rebuild and recruit the tissues and forces, whether lost in the destructive march of such affections, or induced by overwork, general debility, or the more tedious forms of chronic disease.

It is friendly and helpful to the most delicate stomach, and where there is a fair remnant to build on, will reconstruct the most shattered and enfeebled constitution. It is entirely free from any drugs.

It is prepared after a thoroughly tested and scientific method.

PROPRIETORS,

CASWELL, HAZARD & CO.,

Druggists and Chemists,

FIFTH AVE., COR. 24th ST., and SIXTH AVE., COR. 39th ST., NEW YORK.

HUNYADI JANOS MINERAL WATER.

THE BEST AND CHEAPEST

NATURAL APERIENT.

THE BRITISH MEDICAL JOURNAL.

"HUNYADI JANOS.—The most agreeable, safest and most efficacious aperient water which has been brought under our notice."

LONDON MEDICAL RECORD.

"*Hunyadi Janos.*—The most pleasant and, owing to the smallness of its dose, the CHEAPEST of all the natural Aperient Waters."

THE LANCET.

"HUNYADI JANOS.—Baron Liebig affirms that its richness in aperient salts surpasses that of all other known waters."

From Prof. MACNAMARA, Prof. of Materia Medica, Royal College of Surgeons in Ireland.

"Far the most valuable and palatable of our Aperient Mineral Waters. I have been agreeably surprised with the result of a clinical investigation."

Specially approved by the Academy of Medicine of Paris, and its Sale in France authorized by decree of the French Government.

Medals awarded: Lyons, 1872. Vienna, 1873. Paris, 1878.

USES OF HUNYADI JANOS	ACCORDING TO OPINIONS OF EMINENT AUTHORITIES.
1. For habitual constipation.	"None so prompt, mild, and can be so well borne for a length of time."—Prof. SPIEGELBERG, *University of Breslau.*
2. By persons inclined to obesity, congestive and gouty disorders.	"I have used the Hunyadi Janos water in many cases of the rheumatic and gonty diathesis with very marked benefit. In cases accompanied with great obesity I prefer it to any other laxative."—Prof. LEWIS A. SAYRE, M.D., *Bellevue Hospital, New York.* "Preferred to Friedrichshall and Pullna by those who have tried them."—Prof. AITKEN, F.R.S., *Netley.* "Of great use in catarrhal conditions of the pile-ducts and bowels, and for CONGESTION of the LIVER and OTHER ORGANS."—*Medical Times and Gazette.*
3. In chronic affections of the organs of respiration and Circulation.	"Produces remarkable relief in chronic diseases symptomatic of affections of the abdominal and thoracic organs, and in serous effusions with impediment of respiration and circulation."—Prof. ALOIS MARTIN, *Royal Medical Councillor, University of Munich.*
4. Against hæmorrhoids, and portal and hepatic congestion.	"The most certain and the most comfortable in its action of all the aperient waters. The special indications for its use are, in costiveness (especially in that of pregnancy), in portal congestion with tendency to hæmorrhoids, and in sluggish action of the liver."—Inspector-General MACPHERSON, M.D., *Author of "Baths and Wells of Europe."*
5. During pregnancy; for nursery use; and in many female disorders.	"I prescribe none but this."—Baron v. SCANZONI, *Wurzburg.* "I prefer this to any and every other."—Dr. MARION SIMS, *New York, Honorary Fellow Obstetrical Society of London and Dublin.*
6. In bilious attacks and sick headaches.	"I have made use of the Hunyadi Janos mineral water ever since its introduction into this country, and with ever increasing satisfaction. It is highly beneficial to persons of sedentary habit, and in what are called bilious attacks."—Dr. SILVER, *Lecturer on Clinical Medicine, Charing-Cross Hospital.*
7. Against evil consequences of indiscretion in Diet.	"It is invariably good and prompt success: a most valuable item in the balneological treasury."—Prof. VIRCHOW, *Berlin.*

For ordinary aperient purposes a half wineglassful of the Hunyadi Water may be taken at bed-time, or a wineglassful taken in the morning fasting. It is most efficacious when warmed to a temperature not below 60 deg., or when an equal quantity of hot water is added to it.

HUNYADI JANOS MINERAL WATER.

INDISPENSABLE TO THE TRAVELLING PUBLIC.

To secure the genuine Water, require bottles with a blue label bearing the name

The APOLLINARIS COMPANY, Limited, 19 Regent St., London, England.

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION,

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil, by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM, instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat, in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatized Cod-Liver Oil, the active digestive principle of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Pancreatine effects the digestion and assimilation of Cod-Liver Oil and Fat, as well as Food generally. This palatable and popular remedy is therefore invaluable to PATIENTS WHO ARE UNABLE TO DIGEST COD-LIVER OIL, and who are thus deprived of its nourishing and invigorating properties.

Pancreatine Wine. An excellent vehicle for taking Cod-Liver Oil and promoting the digestion of it.

Tins, 1*s*, 2*s*, 5*s*, 10*s*.

AS SUPPLIED TO

THE ROYAL NURSERIES

Of England, Russia, Etc.,

AND CONTAINING THE

HIGHEST AMOUNT OF NOURISHMENT

IN THE

MOST DIGESTIBLE AND CONVENIENT FORM.

THE MOST PERFECT SUBSTITUTE FOR HEALTHY MOTHER'S MILK.

DATURA TATULA FOR ASTHMA, Etc.

A powerful and universally adopted Remedy

"By immediate contact with the air cells and passages, instant relief is given."—Dr. LATHAM, *Physician to the Queen.*

"A remedy of great power and usefulness in Asthma, Chronic Bronchitis, etc."—Dr. W. BARKER.

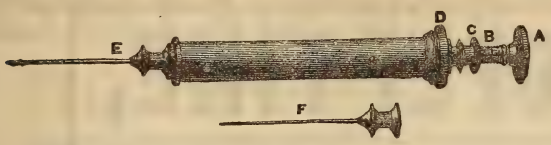
"The Smoke causes no nausea. I have never known an instance in which relief was not obtained." GENERAL ALEXANDER.

In Tins, for use by means of a pipe, Cigars and Cigarettes, and Pastilles, for Inhalation.

SAVORY & MOORE, 143 New Bond Street, London.

Agents for America, E. FOUGERA & CO., NEW YORK.

NEW HYPODERMIC SYRINGES.



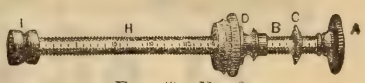


FIG. 48.—No. 2.

These cuts (two-thirds the actual size) represent a New Hypodermic Syringe of our Manufacture. With the exception of the needles, it is of German Silver, a material chosen as possessing, next to steel, the greatest rigidity and durability, while free from liability to oxydation. The barrel is formed by a process peculiar to ourselves, securing uniformity of calibre without soldered joint or seam. It is plated inside and outside with nickel. The piston is packed in the double parachute form, with leather prepared expressly for the purpose. It will be found to retain its elasticity, to operate smoothly, to resist all tendency of fluid to pass above, as of air below it. A nicely-engraved scale upon the piston-rod indicates minims, thirty being the capacity of the syringe.

Syringes Nos. 2, 3, and 4 have also a screw thread upon the piston-rod, and a traverse nut, thereby favoring the utmost nicety in the graduation of doses.

No. 3, Compact, has hollow piston-rod to receive one needle, also a protecting cover and fluid retainer; it may be carried in the Pocket Instrument or Vial Case, or without any case.

No. 4, Compact, is like No. 3, with the addition of a second needle, carried upon the syringe in the usual place, protected by a metal shield.

Nos. 1 and 2 are put up in neat morocco-covered case, with vial.

Two sizes of needles are furnished with each instrument, Nos. 1, 2, and 4; one only with No. 3. They are of refined steel, carefully tempered, and thoroughly plated with gold; they are of small diameter and large relative calibre, sharpened to such an angle as will offer least resistance to penetration, and therefore cause least pain. At the point of union with the socket they are reinforced with an outer covering of German silver, thereby overcoming the tendency to become broken at this place. They are connected with the barrels by a screw thread.

Prices: No. 1, *$3.50* No. 2, *$4.00* Postage, .03
" No. 3, *2.50* No. 4, *3.50* " .02

No. 3.

These Syringes are so thoroughly and strongly made as to be free from the annoying accidents common to most Hypodermic Syringes; and we believe that, for convenience, durability, and nicety of construction, they have no superior.

OTHER HYPODERMIC SYRINGES.

		Postage.
No. 7, glass-barrel, graduation engraved on barrel, with screw nut on piston, nickel-plated mountings, two best steel gilt needles, in neat case	*$3.00*	.02
No. 9, glass, graduation engraved and numbered on piston-rod, with screw nut, best steel gilt needles, in neat case	*3.00*	.02
No. 7 or No. 9, with two steel unplated needles, either	*2.50*	.02
No. 10, glass, Luer's (French), graduation as No. 9, one gold needle and two steel needles, silver mountings, neat velvet-lined morocco case	*12.00*	.02
No. 11, glass cylinder, fenestrated, nickel-plated metal mounting (see cut).		

No. 11.

As represented in the cut, the glass cylinder is encased in a metal mounting, fenestrated to show the graduations for minims. The instrument may readily be taken apart for cleaning, and for those who prefer glass, is recommended for its non-liability to breakage. Price, with two best steel gilt needles, in a neat case..... *$3.50* Postage. .02

☞ *Any of the above will be sent by return mail on receipt of Price and Postage.* ☜

HYPODERMIC SYRINGES OF ALL KINDS PROMPTLY REPAIRED.

Our new *Illustrated Catalogue of Surgical Instruments,* also a new Pamphlet on Inhalation of Atomized Liquids, by distinguished medical authority, with many valuable formulas, will be forwarded, postpaid, on application.

CODMAN & SHURTLEFF,

Makers and Importers of Superior Surgical Instruments,

1140-1191eow **13 & 15 TREMONT STREET, BOSTON, MASS.**

TO THE MEDICAL PROFESSION.

LACTOPEPTINE,

The most important remedial agent ever presented to the Profession for Indigestion, Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all diseases arising from Imperfect Nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase, or Veg. Ptyalin, Lactic and Hydrochloric Acids, in Combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk.....40 ounces.	Veg. Ptyalin or Diastase.....4 drachms.
Pepsin..... 8 ounces.	Lactic Acid.....5 fl. drachms.
Pancreatine ..... 6 ounces.	Hydrochloric Acid.....5 fl. drachms.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its almost universal adoption by the Profession is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned having tested LACTOPEPTINE, recommend it to the Profession:—

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

LEWIS A. SAYRE, M.D.,
Professor of Orthopædic Surgery and Clinical Surgery, Bellevue Hospital Medical College.

F. LE ROY SATTERLEE, M.D., PH.D.,
Professor of Chem., Mat. Med. and Therap. in the N. Y. College of Dent.; Prof. of Chem. and Hygiene in the Am. Vet. College, etc., etc.

SAMUEL R. PERCY, M.D.,
Professor Materia Medica, New York Medical College.

A. VAN DEVEER, M.D.,
ALBANY, N. Y., June 8th, 1878.
Prof. of the Prin. and Prac. of Surg., Albany Med. Col.; Surg. Albany and St. Peter's Hospitals.
"I have given LACTOPEPTINE a good thorough trial, and have been greatly pleased with the excellent results that have followed its administration."

JOHN H. PACKARD, M.D.,
PHILADELPHIA, PA., May 30th, 1878.
Pres't Phila. Co. Obstet. Society; Surg. Episcopal and Women's Hospitals.
"I have found great satisfaction in the use of LACTOPEPTINE, and have ordered it frequently in cases of Dyspepsia, especially where there is want of tone and defective secretion."

JAS. AITKEN MEIGS, M.D.,
PHILADELPHIA, June 20th, 1878.
Prof. of the Institutes of Med. and Med. Juris., Jeff. Medical College; Phy. to Penn. Hos.
"I have used LACTOPEPTINE with very good effect in a number of cases of Dyspepsia."

W. W. DAWSON, M.D.,
CINCINNATI, O., June 21st, 1878.
Prof. Prin. and Prac. Surg., Med. Col. of Ohio; Surg. to Good Samaritan Hospital.
"I have used LACTOPEPTINE with great advantage in cases of feeble digestion."

ALBERT F. A. KING, M.D.,
WASHINGTON, D. C., June 19th, 1878.
Prof. of Obstetrics, University of Vermont.
"I have used LACTOPEPTINE both in hospital and private practice, and have found it to answer fully the purposes for which it is recommended. As an immediate aid to the digestive function, I know of no remedy which acts more directly."

D. W. YANDELL, M.D.,
LOUISVILLE, KY., March 7th, 1878.
Prof. of the Science and Art of Surg. and Clinical Surg., University of Louisville.
"I have made much use of LACTOPEPTINE, and take great pleasure in stating that it has rarely disappointed me. I shall, of course, continue to prescribe it."

ROBT. BATTEY, M.D.,
ROME, GA., June 8th, 1878.
Emeritus Prof. of Obstetrics, Atlanta Med. College, and Ex-Pres. Med. Association of Ga.
"I have used LACTOPEPTINE in a case of Dyspepsia with satisfaction. I think well of it."

CLAUDE H. MASTIN, M.D., LL.D.,
MOBILE, ALA., June 8th, 1878.
"I consider LACTOPEPTINE the very best preparation of the kind which I have ever employed, and for patients with feeble digestion I know of nothing that is equal to it."

Prof. H. C. BARTLETT, PH.D., F.C.S.,
LONDON, ENG., February 22d, 1876.
"I find the preparation of LACTOPEPTINE contains within itself all the principles required to promote a healthy digestion.

PRICE LIST.

LACTOPEPTINE (in oz. bottles).....per oz. $1.00
" (" ").....per doz. 10.00
" (in ½ lb ").....per lb. 12.00

We also prepare the various Elixirs and Syrups, in combination with Lactopeptine.

SPECIAL FACTS CONCERNING

BELLADONNA PLASTER

IN RUBBER COMBINATION.

PREPARED BY

SEABURY & JOHNSON.

In undertaking the manufacture of Medicinal Plasters we had but one object in view—THE IMPROVEMENT OF ALL KINDS OF PLASTERS. Among the various plasters manufactured by us was BELLADONNA PLASTER. This article met with a larger demand than some of the others, acquired a reputation among the best druggists, and received the confidence of the profession. Its large sale interfered with rival manufacturers, and continuous efforts have been made on their part to prejudice physicians against it.

As these attacks have been of late more malicious than usual, we have deemed it advisable, in self-defence, and in order to place our article fairly before the practitioner, to assign reasons why we consider it the most thoroughly reliable preparation ever offered the medical profession. First, it is a combination of the Alcoholic Extract of Belladonna only, with purified rubber, and thus possesses all of the advantages of the rubber base, being pliable, convenient of application, and not subject to the deteriorating influence of age, as is the case when any other base is used. Secondly, it is freed from all irritative properties. Thirdly, it is more adhesive than any other plasters. Fourthly, we believe it to be as perfect, in every respect, as it is possible to make a Belladonna plaster.

ENGLISH EXTRACTS—WHY WE DO NOT EMPLOY THEM.

Imported English Extracts are prepared from the Inspissated Juice of the leaf, while our pharmacopœia formula is treated by Alcohol. The active principle of Belladonna (Atropia) is only partially obtained by Inspissation. The employment of Alcoholic or Hydro-Alcoholic Solvents completely exhausts the entire strength of the drug.

The value of both preparations is clearly presented in an able treatise published in the *American Journal of Pharmacy*, April 1876, page 145. Our own investigations are substantially identical :—

TABLE OF RESULTS,

	Test solution requisite for 100 cc. of Ext. Solution.	Percentage of Atropia in Extract.
EXT. BELLADONNÆ ALCOH. U. S. P.	*17·732*	*2·571*
GEO. ALLEN & CO., English	*9·73*	*1·411*
*HERRINGS & CO., " *	*8·133*	*1·179*
E. MERCK, Germany (aqueous extract), made 1869	*1·9*	*·275*

This analysis clearly establishes the fact that the **Alcoholic Extract of Belladonna of the U. S. P. averages over twice the strength of English Extracts**, and should, therefore, be preferred in all cases where a reliable article is desired. Inspissated and Aqueous Extracts deteriorate, while Alcoholic remain stable.

Therefore the assumption of pretentious manufacturers, that the English Extracts are the superior preparations, must be based on a former supposition rather than present facts. The following analysis substantiates our claim regarding English Extracts.

ANALYSIS OF BELLADONNA PLASTERS, BY PROF. R. OGDEN DOREMUS.

"BELLEVUE HOSPITAL COLLEGE, New York, Sept. 7, 1878.

"GENTLEMEN—I obtained from Messrs W. H. Schieffelin & Co., of this city, samples of Belladonna Plasters prepared by Grosvenor & Richards, Boston ; Mitchell Novelty Plaster Works ; Seabury & Johnson, New York and London. I have examined these varieties for the purpose of determining which possesses the largest quantity of Atropine. I employed equal surfaces of each, and *my analysis demonstrated that* SEABURY & JOHNSON'S *contains the greatest proportion* of the active principle of Belladonna. "R. OGDEN DOREMUS, M.D., L.L.D."

Belladonna Plaster, prepared by Seabury & Johnson, is packed in elegant tin cases, which contain 1 yard each, and can be obtained of almost any druggist throughout the United States and Canada, or will be furnished direct by mail. Samples sent on application.

SEABURY & JOHNSON,

Manufacturers of Medicinal and Surgical Plasters, in Rubber Combination,

21 PLATT STREET, NEW YORK.

ALWAYS SPECIFY SEABURY & JOHNSON'S PLASTERS.

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt. and all its combinations.

Extract of Malt,

WITH COD-LIVER OIL,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO,

(See Transactions of American Medical Association, for 1876, page 176.)

Is presented to the medical profession as an efficient, palatable and very stable combination, consisting of equal parts of the ***Extract of Canadian Barley Malt*** and the best quality of genuine ***Norwegian Cod-liver Oil.*** Many patients take this preparation who cannot take the oil in any other form. It may be employed in all cases where Cod-liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

Extract of Malt,

WITH COD-LIVER OIL AND PHOSPHORUS,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod-liver Oil, Phosphorus being added in the proportion of $\frac{1}{100}$ grain to the dose, and so combined as to be perfectly protected from oxidation. The ***Trommer Extract of Malt Company*** prepare this combination agreeably to the suggestion of ***Dr. Wilson Fox.*** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

Extract of Malt,

WITH COD-LIVER OIL AND IODIDE OF IRON

added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod-liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians, referring to it in terms of high praise.

BARON LEIBIG, the greatest authority on Infant Diet, states that the majority of children who die under one year of age, do so from the effects of improper food, or from the improper administration of the food.

HORLICK'S FOOD.

A Concentrated Extract, prepared according to the Formula of Baron Liebig, and, unlike other Foods,

IS NOT FARINACEOUS.

It is acknowledged by Physicians to be the best Food

For Infants, Dyspeptics and Invalids.

Prof. J. Lewis Smith Says,

Speaking of **HORLICK'S FOOD:** "Being carefully prepared, according to Liebig's Formula, by Chemists fully competent, it possesses certain advantages, such as quick and easy preparation and a pleasant flavor, and is therefore highly esteemed by those who have used it." [*Page 58 of the fourth edition of a Treatise on Diseases of Infancy and Childhood. By J. Lewis Smith, M. D., etc.*—1879] Also, speaking in another place [page 647] of artificial food for infants, especially those suffering from intestinal catarrh, he says: "I prefer Liebig's, especially **HORLICK'S** preparation of it."

Report from Bellevue Hospital, New York.

In *The Hospital Gazette* for February 6th. 1879 [page 108] Dr. E. Hochheimer makes a report from BELLEVUE HOSPITAL of a case of Infantile Paralysis, which was followed by an exhausting diarrhœa—Speaking of the treatment, he says: "Her condition continued unchanged for the next three weeks; she was put upon a diet consisting principally of milk, but the diarrhœa persisted in spite of opiates and astringents."

"*Nov. 17th.—Milk was stopped, and she was put upon a diet of HORLICK'S FOOD; after this she began to mend, the diarrhœa became less and finally disappeared; she began to gain flesh, and her general condition was much improved.*"

We also beg to refer, by permission, to the following eminent medical men, who have used our Food extensively in their practice :— **Prof. DeLaskie Miller,** (Rush Medical College); **Prof. Wm. H. Byford,** (Chicago Medical College); **Prof. J. Adams Allen,** (Rush Medical College); **Drs. J. P. Oliver** and **C. P. Putnam,** (Harvard Medical School); **Prof. Gawne,** (Cleveland Medical College); and several hundred others whose testimonial letters are on file in our office.

PRICE, 75 Cents per bottle. Trial Size, 40 Cents.

DR. McINTOSH'S

Natural

UTERINE SUPPORTER.

No instrument has ever been placed before the medical profession which has given such universal satisfaction. The combination is such that the Physician is able to meet every indication of Uterine Displacements. Falling Womb, Anteversion, Retroversion and Flexions are overcome by this instrument, where others fail; this is proven by the fact that since its introduction to the Profession it has come into more general use than all other instruments combined.

Among the many reasons which recommend this Supporter to the Physician is its self-adjusting qualities. The Physician after applying it need have no fear that he will be called in haste to remove or readjust it, as is often the case with rings and various pessaries held in position by pressure against the vaginal wall, as the patient can remove it at will and replace it without assistance.

The Abdominal Supporter is a broad morocco leather belt, with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen. The Uterine Support is a cup and stem made of highly polished hard rubber, very light and durable, shaped to fit the neck of the womb, with openings for the secretions to pass out; as shown by the cuts. Cups are made with extended lips, to correct flexions and versions of the womb.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, passing down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic adapt themselves to all the varying positions of the body, and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Anteversion, Retroversions, or any Flexions of the Womb, and is used by the leading Physicians with never failing success, even in the most difficult cases.

Price—to Physicians, $8.00; to Patients, $12.00

Instruments sent by mail, at our risk, on receipt of price with 16 cents added for postage, or by Express, C. O. D.

C. A. LE BOUTILLIER, M.D., Lecturer on Surgical Dressings.
CHAS. W. MATHERS, M.D., Demonstrator of Anatomy.
WM. L. DUDLEY, Demonstrator of Chemistry.

The Preliminary Term of Lectures will begin September 3d, 1879, and continue one month. This Course will be one of *unusual interest and importance* to physicians as well as students.

The Regular Winter Session will begin October 1st, 1879, and continue five months. This course will consist of Didactic Lectures with Demonstrations, Recitations, Clinical and Special Instruction, involving Physical Manipulations. From five to six Didactic Lectures and Demonstrations are delivered daily, covering the general topics of Medicine and Surgery as taught in all regular medical colleges.

CLINICS.—The Faculty confidently announce that students have, in this college, unsurpassed clinical advantages. *Four Special Clinics* are held daily, in the college building (at which more than six thousand patients are examined annually), viz.: In Practice, Surgery, Gynæcology, Diseases of Children, Ophthalmology and Larnygology, in all of which advanced students have opportunities to make full examinations, especially in *Thoracic Diseases* and *Gynæcology*, and frequently to witness *Obstetric* cases. These clinics are free to students of the college. Two clinical lectures are delivered daily at the Cincinnati Hospital (near the college), during the entire college session.

The College also affords the fullest advantages in *Practical Chemistry*, *Practical Anatomy*, *Practical Physiology* and *Microscopy*.

FEES.

Matriculation fee (annually)	$ 5 00	Demonstrator's Ticket	$5 00
Regular Lecture Term	75 00	Hospital Ticket	5 00
Graduation Fee	25 00	Alumni of this institution free.

Emeritus Professor of Ophthalmology and Otology.

THEO. A. McGRAW, M.D., President,
Professor of Principles and Practice of Surgery and Clinical Surgery.

GEORGE P. ANDREWS, M.D.,
Professor of Principles and Practice of Medicine and Clinical Medicine.

C. B. GILBERT, M.D.,
Professor of Obstetrics, and Diseases of Women and Children.

N. W. WEBBER, M.D.,
Professor of General and Descriptive Anatomy, and Clinical Surgery.

SAMUEL P. DUFFIELD, PH.D., M.D.,
Professor of Toxicology and Medical Jurisprudence.

ALBERT B. LYONS, M.D.,
Professor of Chemistry and Director of the Chemical Laboratory.

LEARTUS CONNOR, M.D., Secretary,
Professor of Physiology and Diseases of the Eye and Ear.

H. O. WALKER, M.D.,
Lecturer on Anatomy and Genito-Urinary Diseases.

E. L. SHURLY, M.D.,
Lecturer on Materia Medica, Therapeutics and Clinical Laryngology.

HAL. C. WYMAN, M.D.,
Lecturer on Physiology.

J. G. JOHNSON, M.D.,
Lecturer on Diseases of Mind and Nervous System.

J. H. CARSTENS, M.D.,
Lecturer on Clinical Medicine.

F. A. SPALDING, M.D.,
Lecturer on Diseases of the Skin.

C. C. YEMANS, M.D.,
Lecturer on Chemistry.

E. A. CHAPOTON, M.D.,
Demonstrator of Practical Physiology and Instructor in Anatomy and Surgery.

J. W. ROBERTSON, M.D.,
Demonstrator of Practical Microscopy.

DAVID INGLIS, M.D.,
Instructor in Chemistry and Physiology.

E. B. WARD, M.D.,
Curator of Museum and Librarian.

The Collegiate Year is divided into three sessions.

Preliminary Session opens Wednesday, September 3d, 1879, and closes September 30th. The Clinics are held and the Lectures delivered by the Professors of the regular Faculty, and in the same order and frequency as during the Winter Term. Opportunity is given to dissect or work in the Chemical and Physiological Laboratories.

The Regular Session opens Wednesday, October 1st, 1879, and closes March 2d, 1880. During this term all the branches of *General Medicine* and *Surgery*, both scientific and practical, are taught with care and thoroughness. All students are daily examined on the subjects of the lectures and on their dissecting and laboratory work.

Senior students have *daily practice* in the *art of examining patients*, in forming their own diagnosis, prognosis and treatment. As this is done under the direction of the professor holding each clinic, and in the presence of the class, it constitutes an invaluable course of training.

The Recitation Session begins March 10th, 1880, and closes June 23d, 1880. Daily during this term will be held recitations for both Seniors and Juniors, and one or two clinics and a lecture.

The recitations will embrace a thorough drill upon the general subjects of the Regular Session, viz.: Anatomy, Chemistry, Physiology, Practice of Medicine, Materia Medica and Therapeutics, Surgery, Obstetrics, Diseases of Women and Children.

Though the Recitation and Preliminary Sessions are optional, it is hoped that all who can will avail themselves of their manifest advantages in commencing the study of medicine, or in supplementing the regular winter course.

Three Hospitals—Harper's, St. Mary's and St. Luke's—with two large free dispensaries, afford an abundance of clinical material for illustrative and practical teaching.

All lectures are delivered on Hospital grounds. The *peculiar feature* of this school is the *intimate union* between its *laboratory*, *clinical* and *didactic* instruction.

Fees.—For Preliminary and Regular Sessions: Matriculation, $5. Hospital Fees, $10. Lecture Fees, $40. Graduation, $25. Lecture Fees to third course students, $25.

For the Recitation Term the Lecture Fees are $10, to those who attend the other courses. All others are required to matriculate and take out the Hospital tickets.

All fees payable in advance to the *Secretary*.

Announcement and Catalogue, or any further information which may be desired, can be promptly obtained by addressing

NOW READY.

LESSONS IN GYNECOLOGY.

BY WM. GOODELL, A.M., M.D.,

Professor of Clinical Gynecology in the University of Pennsylvania.

With Numerous Illustrations

1 Vol., 8vo. Price, Cloth, $3.00.

This entirely new and complete work by this distinguished author cannot fail to prove a valuable addition to gynecological literature. The following table of contents will indicate its scope :—

Lesson	I.	Gynecological Instruments.
"	II.	Caruncle, and other Affections of the Female Urethra.
"	III.	Vesical Dis ases of Women.
"	IV.	Fistulæ of the Female Genital Organs.
"	V.	Closure of the Vulva for Incurable Vesico-vaginal Fistulæ—Tumors of the Vulva.
"	VI.	On the Causes, Prevention, and the Cure of Lacerations of the Female Perineum; the Primary Operation.
"	VII.	Secondary Operation for Laceration of the Female Perineum.
"	VIII.	Local and Constitutional Treatment for Chronic Metritis and Endometritis.
"	IX.	Retroversions and Retroflexions of the Womb.
"	X.	Anteversions and Anteflexions of the Womb.
"	XI.	Dilatation of Cervical Canal; Rapid Dilatation; Tents.
"	XII.	On the Use of the Closed Lever Pessary, and of the Intra-uterine Stem Pessary.
"	XIII.	Different Kinds of Pessaries; Abdominal Supporters.
"	XIV.	Prolapse of the Womb; Prolapse from Simple Descent; Prolapse from Hypertrophic Elongation of the Infra-vaginal portion of Cervix.
"	XV.	Prolapse of the Womb from Hypertrophic Elongation of the Supra-vaginal Portion of the Cervix.
"	XVI.	Laceration of the Cervix Uteri.
"	XVII.	Cancer of the Womb.
"	XVIII.	Vegetations of the Endometrium.
"	XIX.	Polypus of the Womb.
"	XX.	Fibroid Tumors of the Womb.
"	XXI.	Treatment of Fibroid Tumors of the Womb.
"	XXII.	Spaying for Fibroid Tumors, and for other Diseases of the Womb.
"	XXIII.	Ovarian Cyst; its Diagnosis, and its Treatment by Tapping, by injections of Iodine, and by Drainage.
"	XXIV.	Ovariotomy by Abdominal Section.
"	XXV.	Vaginal Ovariotomy.
"	XXVI.	Nerve-tire and Womb-ills, or the Relation which the Nerves bear to the Diseases of Women.
"	XXVII.	The Prevention of Uterine Disorders.
"	XXVIII.	The Sexual Relations as Causes of Uterine Disorders.

These subjects are presented in a novel and attractive literary form, from the riches of an uncommonly wide clinical experience. Dr GOODELL'S operative procedures are generally marked by strong originality and much ingenuity; while his therapeutical plans are the result of very carefully studied observation. As a lecturer and teacher he is well-known to all students of his specialty, and the present volume is the only one he has published on the subject, and therefore the only source from which to derive a knowledge of his methods.

BETHESDA WATER.

BELLEVUE, PA., May 21st, 1879.

W. B. HYATT, M.D.,
Marshallville, Wayne Co., Ohio.

DEAR SIR:—Your letter received this morning. Am sorry my friend Dr. S. did not think to tell you to address me at Pittsburg, and your communication would have reached me in a few hours instead of days, as I seldom call at the village P. O.

You will address your orders for BETHESDA WATER to JOSEPH FLEMING, 84 Market Street, Pittsburg, Pa., and they will receive prompt attention. I say this on account of my business acquaintance with Mr. Fleming. I will call on him in the morning, and have him send you pamphlets and any information relative to the matter he may think required.

If my testimony regarding the efficacy of Bethesda Water was required, I could cite several cases of my own personal knowledge. I am convinced that it is a specific in diseases arising from a morbid condition of the kidneys, providing, of course, that the disease has not reached a point beyond the possibility of recovery, as in the case of my late brother, and even then no figures could estimate its value in giving relief from suffering. I have a friend who was under treatment of different physicians all last fall and winter, and apparently getting worse: I persuaded him to stop the treatment and use the "water," and before he had used ten (10) gallons he was much better, and now nearly if not quite well. The doctors would diagnose Phlebitis, but there was a low specific gravity of the urine and other indications of kidney or dropsical affection, which satisfied me that he needed the effects of the "water;" and the results are as stated, and the inflamed vein is getting well, as well as general improved health. It occurs to me, the duty of physicians to investigate such things, and if they contain medicinal virtues, to make it known to suffering humanity instead of standing aloof until men in other walks of life have long recognized and demanded its use. Of course, there are so many new remedies claimed that are worthless, that there is some excuse, yet this Bethesda Water has been in use more than ten (10) years, and comparatively few physicians appear to know anything about its properties. Although you are a stranger to me, allow me to commend you, or any worthy physician who is willing to investigate and test its claimed virtues, and if found, to disseminate the knowledge among their less fortunate fellows. Yours, truly,

W. J. THOMPSON.

P. S.—If you have occasion to address me further, send your letter to Auditor's Office, P. A. R. R., Pittsburg, Pa.

Sunnyside Medical Retreat

For Mental and Nervous Diseases, Inebriety and the Opium Habit,

FORT WASHINGTON, NEW YORK CITY.

This home, situated on the banks of the Hudson, under the management of Dr. Edward C. Mann, late Medical Superintendent of the New York State Emigrant Insane Asylum, receives cases of either sex affected with mental disorders, Inebriety or the Opium habit. The beauty of location and surroundings, handsomely furnished apartments, and the attentions and comforts of home life, all combine to make Sunnyside an attractive and popular private retreat. Applications may be made to Dr. Mann, either by mail or personally, at Fort Washington. Twelve trains daily from Hudson River Depot, 30th St., and 10th Ave. Broadway and 23d St. line of stages run direct to depot. The profession respectfully invited to call, and cordially welcomed. 1152-1y

WOMAN'S HOSPITAL MEDICAL COLLEGE

337 and 339 S. Lincoln St., Chicago.

The *Tenth Annual Course of Lectures* will commence the first Tuesday in October, 1879, and continue twenty-one weeks. The Spring Term will commence April 1st, and continue twelve weeks. College building new. Clinical and Dissecting advantages unsurpassed.

FACULTY.—William H. Byford, A.M., M.D., President, Obstetrics; T. Davis Fitch, M.D., Gynecology; Chas. Warrington Earle, M.D., Treasurer, Diseases of Children; Isaac N. Danforth, M.D., Pathology; John E. Owens, M.D., Surgery; Henry M. Lyman, A.M., M.D., Practice of Medicine; Daniel R. Brower, M.D., Secretary, Nervous and Mental Diseases; Sarah Hackett Stevenson, M.D., Corresponding Secretary, Physiology; David W. Graham, A.M., M.D., Anatomy; Plymouth S. Hayes, M.D., Chemistry; Wm. J. Maynard, A.M., M.D., Therapeutics and Dermatalogy; Wm. T. Montgomery, M.D., Eye and Ear; E. Fletcher Ingals, M.D., Diseases of Chest and Throat; John O. Hobbs, M.D., Demonstrator.

For information or announcement, address either of the Secretaries, at 125 State Street.

1141–1192 W. H. BYFORD, A.M., M.D., *President.*

Starling Medical College,

COLUMBUS, OHIO.

The Thirty-third Session of Starling Medical College will begin October 2, 1879, and continue until March, 1880. It will be preceded by a preliminary course beginning September 3, 1879. Extensive additions have recently been made to the Museum and other teaching facilities of the College.

FACULTY.—F. Carter, M.D., Dean; H. G. Landis, M.D.; J. H. Pooley, M.D.; S. Loving, M.D.; J. M. Wheaton, M.D.; E. B. Fullerton, M.D.; W. J. Conklin, M.D. (of Dayton); Alex. Dunlap, M.D.; Otto Frankenburg, M.D.

Lecture Tickets, including matriculation, $45.

College, cor. of State and Sixth Sts.; Dean's Office, 181 E. State St.

Letters of inquiry should be addressed to the Dean.

Prof. FRANCIS CARTER, M.D., Dean, Columbus, Ohio.
1150–1201

Columbus Medical College.

Preliminary Course begins September 1st.
Regular Course October 1st, 1878, and closes the last week in February, 1879.

Tickets	$30.00
Matriculation	5.00
Graduation	25.00
Demonstrator	5.00

A NEW FORM OF MEDICATION,

COMBINING

Reliability and Accuracy for the Physician,
Convenience and Elegance for the Pharmacist.

Saccharated Extracts.

THE DRY, SOLUBLE, EXTRACTIVE MATTER OF THE DRUG IS TRITURATED WITH MILK SUGAR IN SUCH PROPORTION THAT ONE TROY OUNCE OF THESE EXTRACTS REPRESENTS ONE TROY OUNCE OF THE DRUG.

A Soluble Drug of Uniform Strength and Quality.

The **percentage of Dry Extract** is in all cases **indicated** on the label.

In the more **powerful remedies** the **percentage** of **alkaloid** is also indicated.

The advantages of the **Saccharated Extracts** over ordinary extracts are:—

1. They are stable at all temperatures and under all conditions; they will not swell, ferment, or waste.
2. They are always of a uniform and convenient consistency, not becoming solid, as is the case with ordinary powdered extracts.
3. Their division is rapidly effected, and with great convenience.
4. Their invariability in strength renders them capable of being prescribed with precision.
5. Their general application to any form of medication, as Capsules, Compressed Pills, Troches, etc.

Office, 87 Clark St., Chicago.

Manufactures and keeps constantly on hand a general assortment of
SURGICAL INSTRUMENTS,
Of the finest quality and most approved patterns.
Orders from Country Physicians will receive particular attention. 1035-tf

DR. L. D. McINTOSH'S
Electric or Galvanic Belt.

If this new combination could be seen and tested by the medical profession, few, if any, words would be needed from us in its favor, for it combines utility with simplicity in such perfection that seeing it is convincing proof of its great value. The medical profession to-day acknowledge, almost universally, Electro-Therapeutics.

This combination is composed of sixteen cells, placed in pockets on a belt. Each cell is made of hard vulcanized rubber, lined with a copper cell, which constitutes the negative plate. The rubber coating perfectly insulates each cell. The positive plates are of zinc, wrapped in a porous material, to absorb the exciting fluid and prevent contact with the copper, and permit the current to pass from the copper to the zinc.

Thus the cells are charged without wetting the belt, and the discomfort following to the patient. A wire is soldered to each zinc plate, which connects with the copper cell by entering a tube on its side, thus rendering the belt pliable.

The McIntosh Electric Belt is superior to all others for the following reasons:—

It is composed of sixteen cells—thus giving a powerful current. A current selector is so arranged that one or more cells can be used at pleasure. There is not anything irritating about the Belt, as is the case with all other contrivances where the metal used is wet with weak acids and placed next to the skin. The electrodes are pieces of metal covered similar to ordinary battery electrodes, and connected with the cells by connecting cords. By this arrangement, a current from the Belt can be applied, to produce a general or local effect.

Physicians who have used this belt in their practice do not hesitate to recommend it to the profession.

Our pamphlet on Medical Electricity sent free on application. Address

HORSFORD'S
Acid Phosphate,

(LIQUID.)

For Dyspepsia, Mental and Physical Exhaustion, Nervousness, Diminished Vitality, Urinary Difficulties, etc.

Prepared according to the directions of E. N. Horsford, late Professor in Harvard University.

The value of this preparation of Acid Phosphate was long ago theoretically demonstrated, and has since been firmly established by experience obtained from its continued use in a great variety of cases, in every part of the country. It affords nourishment to the cerebral and nervous systems, and restores to their normal action deranged secretory organs, and gives vigor and renewed strength to the human system when weakened by overwork.

There seems to be no difference of opinion in high medical authority, of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.
No danger can attend its use.
Its action will harmonize with such stimulants as are necessary to take.
It makes a delicious drink with water and sugar only.

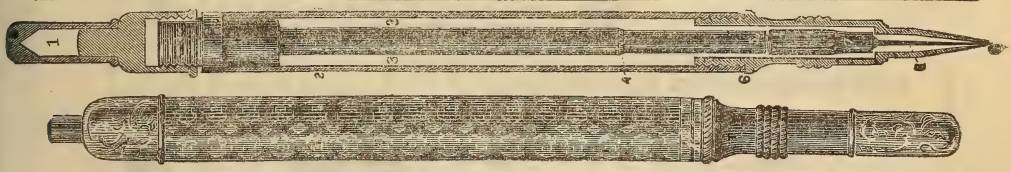
Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges.

MANUFACTURED BY THE

RUMFORD CHEMICAL WORKS,

1155-1206 PROVIDENCE, R. I.



THE MACKINNON PEN.

Will write 75 pages foolscap without refilling; abolishes steel or gold pens, pen holders, pencils and inkstands. Writes on any paper, with any clean ink. "The point of the pen is actually a ring of iridium," says the report of the Franklin Institute. Can be carried in the pocket or used at the desk. "Warranted to show no signs of wear in three years." No professional man should be without it. Examine it, at
